In his second volume, we find our author transported into another peculiar region—the island group along the western coast, about which he tells us more than enough. After wading through his manifold details about seal-hunting and duck-catching, dikes and sand-hills, tides, currents, and north-west gales, a chapter on each, our only wonder is, how people can be found to live by choice in such a dreadful country. Most of these islands, which have no dikes to keep out the sea, are flooded at every spring-tide; and he tells a marvellous story of a ship having sailed right across the flooded land, at one unusually high tide, without knowing it. The houses are perched on mounds from fifteen to twenty feet high, but the tides sometimes rise even higher, turning the scanty stock of rain-water in the tanks into brine, and sweeping everything off but the haystacks, which, to guard against such an emergency, are secured by strong cables, passing over their tops, and brought down on either side to the heaviest stones that can be got, by way of anchors. Then we have a good deal of curious matter (chap. ii. vol. 4) upon a subject of peculiar interest to the student of our early history—namely, the origin and location of the northern tribes who settled among us in the Saxon times. A district of some twenty miles square, on the eastern side, is still called *Anglu*, and inhabited by *Angles*, a separate people in face and speech from any of the Danes. The alternation of hill and dale, with green thorn-hedges, the comfortable people and farm-houses of this little district, are all peculiarly English-like, and reminded him, he says, at every step of the county of Kent. The Frisian people, on the other hand, upon the west coast, claim for themselves exclusively the honour of having planted the Anglo-Saxons, and appeal to the identity of their language, which comes nearer to English than any other. Kohl gives us a distich current among them, in which every word is identical, 'Good bread, and good cheese, is good English, and good Friese' (or Frisian). Walking in one of the villages, he abruptly asks a child whom he met, 'Where did Hengist and Horsa sail from?' To which the answer immediately was, 'From Tondern on the Eyder.' It is certainly curious thus to see traditions familiar even to little children on the opposite side of the North Sea, which have so completely passed away from among ourselves.

All the popular tales of dwarfs, giants, and 'good people,' gnomes, nixes, and water-spirits, which are current in Germany and Ireland, and wherever good literature is dear, meet here with full acceptance, together with many a local legend of the true Scandinavian species, in which everything that is not minute is gigantic. Such is that strange fancy of the Danish sailors about the phantom ship, called 'Mannig Fual,' which is so huge, that the captain rides round its deck on a goblin steed to give his orders, and the life of a man is consumed in the time necessary to mount to and furl its sails. The islands of which we have spoken are formed of the ballast thrown overboard when it ran aground, and the chalk cliffs of Dover, according to the legend, owe their whiteness to the paint on its cabin windows, which was rubbed against them once upon a time when the vessel was somewhat squeezed in passing through the Straits. Great Britain forming the western boundary of the North Sea, and stretching the whole way right opposite to Denmark, is a frequent theme in these popular superstitions. Thus the Straits of Dover are attributed to the quarrel of a Danish king with an

English queen, who, in revenge, caused a channel to be cut through the isthmus which then united England to the continent, and thus precipitated the sea upon the Jutland coast. A very restless important personage, a kind of Puck on a larger scale, is constantly in the mouths of the people, under the name of 'Peter of Scotland,' supposed to haunt the highest summits of the Grampians, and from thence to breathe across the sea north-west winds, and their accompaniments of famine and disease. Most of these ideas are referable to natural causes. Where acre after acre of the land has been swallowed up by the sea, till the present coast-line is full fifteen miles east of the shore from what it was two hundred years ago, it is not wonderful that the people should fancy that they still see the houses and farm-yards of the sunken continent through the clear water, and hear the church-bells ringing with unearthly sweetness from below. The belief in a malignant water-spirit, who rides upon and propels the inundations, has the same origin. 'No one dares walk at night by a certain bay in Jutland, from the vision of a bleeding arm, which is supposed to be witnessed there, commemorating the fate of a shipwrecked mariner, who, after winning his way to shore, was murdered by the wreckers for the sake of his gold. The murderers were yet quarrelling over the division of their plunder, when the sand was slowly stirred, and the vision of the murdered man arose among them to reclaim his own. They tore from the body the head and right hand, but still the bleeding arm moved with them, and stood where they stood, till the murder was found out.' No doubt this ghostly superstition has had but too real an origin among the many catastrophes which happen every year on this wreck-strewn coast.

Kohl lingers so long among the wild people and scenery of the western coast, that he is obliged to make short work of the more civilised districts extending to Copenhagen. From the 'neat and cleanly' Kiel, as he truly calls the capital of Holstein, he pushes on at once to the passage of the Little Belt, now traversed in two places by steamboats. But Kohl being romantically inclined, prefers to cross it in an open boat by moonlight, and gives us, in consequence, whole pages of Byron at second-hand. The Little Belt, the narrowest and least-used of the three great inlets to the Baltic, is impassable for shipping, through a sand-bank running right across it in the middle from shore to shore. In the early winter months, from November to January, it presents a curious scene when the great herds of porpoises moving in from the North Sea are intercepted in this natural *cul de sac*, and there, unable to escape, with the land on two sides, the sand-bank in front, and the hunters in rear, are slaughtered by hundreds for the sake of their blubber and skins. Besides a lengthened description of this sea-hunt, which he never saw, and some remarks on the duties levied at the Sound, he tells us nothing more of these great inland straits, the arteries of Denmark; but to make amends, there is a great deal about Odin and Thor, and still more about German patriotism and philosophy, remarks on art and architecture, landscape gardening and general education, which have nothing more to do with Denmark than any other corner of the globe. His discursiveness becomes by this time a decided nuisance, and we are not sorry when he takes up his quarters finally at Copenhagen, and there dilates through a volume and a half, to his heart's content, upon everything and everybody.

The Danes are very proud of Copenhagen; and no wonder, for it is the only town they have. It is likewise the only island capital in the world, past or present, of any consequence; for Venice is morally and materially connected with the continent, and some peculiarities of manners and appearance are the consequence. Living as we do in the focus of a network of railways, which knit us inseparably to two hemispheres, we can hardly realise the situation of Copenhagen; sometimes, in the winter time, cut off by the drift-ice for a fortnight together from all communication with the continent,

when not a letter or a newspaper can pass, and the king and the citizen are equally imprisoned, in ignorance of all that is going on in the outer world. The inhabitants, at such times, look dreary enough, but the town is always noble-looking. Its aspect, on emerging from the narrow entrance into the port, is very grand and striking. In summer, the enormous transit of vessels through the Sound causes a peculiar degree of animation; and then one may see the noble panorama of sea, and islands, and gliding sails, and ancestral towers, rising above the dark-green clumps of fir which Southey has painted in his living prose. As to the general street views and interiors, however, Copenhagen is only a kind of representative city—very neat and clean, and all that—where one may see, in the compass of a walk, warehouses and dockyards after the model of London and Woolwich; palaces like Versailles and St Cloud, only a third of the size; granite quays like St Petersburg; and abundance of bridges after the Venetian; all of them well worth seeing for those who cannot see the originals, but altogether lacking that in-born individual character, that embodying in brick and stone, of the peculiar spirit of a peculiar people, which are so wonderful in the old Flemish and Italian cities. The air of the whole is respectable and substantial; and the people, so far, are very like their city.

Such is a glance at the contents of the work before us, which unfortunately we cannot speak of in the terms of laudation often lavished on this writer. The work is doubtless often amusing, whether the author is enlarging on his own or other people's speculations; his own or other people's eating, walking, boating, and suffering from wind and weather; the lakes and inlets he crosses, or would have crossed, if he had been able; and much more to the same purport. His subjects also are frequently good, but unluckily he never knows when to have done with them. He often excites our interest, and then suffers it to die from pure inanition; not that he could not put the matter in a tenth part of the room, but then he could not fill his book. The result is a perfect *olla podrida* of subjects—sometimes interesting, sometimes long and dry—the whole diluted and overlaid with interminable German reflections, moral and philosophical, mostly of that species which no one can deny, and every one can make. He sometimes mingles his sublime pathos with the bathos; and his descriptions of scenery are always as flat as the country he traverses; but then, it must be allowed, there was very little in its aspect to kindle his enthusiasm.

FACTS FOR THE CURIOUS.

DUTCH papers mention the discovery of an extensive bed of coal at Batol Apie, on the south of Borneo. As steam navigation is on the increase in the East, such a deposit will prove of infinite value. This discovery, conjoined with the fact, that coal is also met with in the isle of Labuan, would seem to demonstrate that the Malaysian islands are as rich in mineral as they are already known to be in metallic and vegetable produce.

At a recent meeting of the Geological Society, a fact was stated in reference to the low-conducting power of clay and sand, which may prove of value not only in the prevention of fire, but in the retention of heat for an almost indefinite period. It was, that a thickness of half an inch of clay and sand intercepted the heat of a mass of eleven tons of white-hot melted cast-iron for twenty minutes, without the heat on the outside of the vessel being sufficient to pain the hand!

The loss to the public from excess of washing, scrubbing, &c. which a smoky atmosphere renders necessary, is much larger than at first sight might appear. Dr Lyon Playfair has shown, that to this one item Manchester has been expending £60,000 a-year, and that if the expense of additional painting and whitewashing be added, the actual money loss would be double the amount of the poor-rates every year. The Rev. Mr Clay states, that in Preston only two furnaces consume their smoke, and even that imperfectly; but were all the factories in the town to do as

much, the public would save £10,000 a-year in extra washing.

It was on a Sunday morning, says Mr Gardner the botanist, that I arrived in Liverpool from Brazil, and during the course of that day I saw in the streets a greater number of cases of drunkenness than, I believe, I observed among the Brazilians, whether black or white, during a five years' residence in that country!

In connexion with the above, we may extract the following distressing and discreditable statistics from a recent little work, entitled 'The Poor Man's Four Evils':—The quantity of spirits entered in 1845 for home consumption in the United Kingdom was 26,672,477 gallons; of wine, 6,838,684; of ale, 480,000,000: the population was 27,000,000. This would give for each person eight pints of spirits, which, at 1s. 6d. a pint, amounts to 12s.; two pints of wine, at 2s. each, comes to 4s.; in ale, £2 a-year for each person—being in all upwards of seventy-five and a half millions sterling spent in the country for preparations in a great degree unnecessary and destructive.

The beneficial effects of sewerage and ventilation could not be more convincingly exhibited than in the following quotation from Mr Liddle's evidence before the Health of Towns Commission:—The London Hospital was badly drained, heated with hot air, and not large enough for the number of inmates. In 1837 and 1838 respectively, the mortality was 14 and 12½ per cent. In 1839 the sewerage was completed, and the mortality fell to 9½ per cent. In 1840 the hot air was discontinued, and a further decrease to 9 per cent. took place. In 1842 the new wing was opened, when the mortality fell to 8 per cent., and in 1843 to 7 per cent.!

Mr Morse, the American electric telegraph inventor, is said to have effected improvements in his apparatus, by which communications are impressed on paper at the rate of fifty letters per minute.

A German journal states that the application of galvanism has been made in Austria for preserving trees and plants from the ravages of insects. The process is very simple; consisting only in placing two rings, one of copper, and the other of zinc, attached together, around the tree or plant. Any insect that touches the copper receives an electric shock, which either kills it, or causes it to fall to the ground.

THE PARIS BAKER.*

You descend, by a tortuous flight of steps, into a subterranean cavern, which resounds with sharp cries and suppressed murmurings. The reflection from a burning furnace unites, with the pale light of the lamps, to reveal, under a black and smoky vault, the confused forms of meagre and haggard humanity, half-naked and half-roasted, ready to cry out with St Lawrence, 'Turn me on the other side!' What are these mysterious and busy shapes? Are they conspirators, coiners, or something worse? You see before you simply bakers at work. That huge orifice gleaming with flame is the mouth of the oven; those sharp whistling cries are the song of the cricket, the familiar guest of the bakehouse; and that sob-like sound proceeds from the chest of the man who is laboriously kneading the dough in preparation for your morrow's meal. All those instruments which you see about, scattered on the floor, resting against the walls, or in the hands of the workmen, are made use of in the confection of bread: shovels, kneading-troughs, dough-knives, oven-rakes, baskets, hand-mills for grinding compressed flour, and divers other bread-making implements.

At Paris only can you witness this nocturnal travail in all its extent. The provincial baker goes late to rest and rises early, but still he passes the night in bed. From dawn until noon he prepares his mass—bakes his batch of bread, and carefully controls the operations of his oven; after which he has a respite for some hours; but he resumes his functions towards nine in the evening, precluding his night's repose by hours of wearisome labour.

It is a singular thing, that this branch of industry, which one would have supposed as ancient as agricul-

* This article is principally from the French.

ture, was hardly known to the Pagan world. The Roman matron made bread for the family during the hour which preceded the repast; it was baked upon the hearth, by covering it with hot cinders, or sometimes upon a kind of grill over burning coals. The use of the oven was imported to Europe from the East, in the five hundred and eighty-fourth year from the building of Rome. At this period bakers were established in the fourteen departments of the Eternal City, and formed a college, to which they remained attached, with their families; nor were they permitted to quit their occupation, nor even to pass from one locality to another.

The first bakers in France were called *tamisiers*, from the word *tamis*, a sieve, which would seem to indicate that they were the first of their countrymen who sifted the meal; afterwards, in the thirteenth century, they were called *boulangers*, from the spherical or ball-like shape of the loaves they manufactured. Their community was under the protection of the Grand Panetier of France, and its freedom was only to be obtained by a candidate who had been successively winnow, bolter, assistant-kneader, kneader, and head-journeyman for a period of four years. He then appeared before the chief of the community, bearing in his hand a pot full of walnuts. 'Master,' said he, 'I have accomplished my four years, here is my pot full of walnuts.' The chief, having first carefully ascertained the actual duration of the apprenticeship, took the pot, broke it upon the pavement, and received the neophyte.

In the seventeenth century, the community was subjected to the jurisdiction of the provost of Paris, and the lieutenant-general of police. In 1762, the number of bakers in the city proper amounted to two hundred and fifty; in the faubourgs were six hundred and sixty more; and upwards of nine hundred brought bread to the capital twice a-week from St Denis, Gonesse, Corbeil, and other places.

The Revolution did not effect the complete enfranchisement of the bakers, who are still subjected to certain old *ordonnances*; such as that of the provost of Paris of the 22d November 1546. 'The bread,' says this edict, 'must be without mixture, well kneaded, fermented, properly shaped, well baked and dusted, cooled and dressed, by half-past six in the morning. It is forbidden to use any rejected or damaged flour, or injured grain, or bran re-ground.' Two ancient decrees of parliament remain in their pristine vigour—one of the 16th of November 1560, the other of the 20th of March 1670. The first interdicts the employment of any other yeast than that which is produced in Paris and its environs, fresh and unadulterated. The second compels the bakers to provide proper weights and scales, and to keep them publicly suspended in their shops, that the purchaser may have the article weighed if he choose. They have taken as a base for the weight of each loaf, a report of the Academy of Science, confirmed by decrees of parliament of the 25th of July 1785, which lays down the principle that a sack of good flour, of the weight of three hundred and twenty-five pounds, yields at least four hundred pounds of bread.

The profession of a baker can neither be commenced nor abandoned without the previous permission of the authorities. The list of bakers of Paris, classed according to the quantity of flour which they consume daily, is published every year. Special decrees and ordinances regulate the state of the profession, both in the capital and in the departments. The minutest details of this important branch of industry have been cared for; and the bakers' apprentices are the only operatives for whom the law prescribes a uniform. 'They are to wear, when at work, a frock which reaches below the calf of the leg, without any slit or opening, and a waistcoat closely buttoned, which may be without sleeves. They are not, in any case, to show themselves in the streets without pantaloons, and a waistcoat with sleeves.' If, therefore, you see a baker in his working-dress tranquilly smoking his pipe at the door of his shop, you are authorised to raise the hue and cry. It is a contraven-

tion, and the offender is liable to penalty or imprisonment; though it would appear that this regulation is never enforced in the present day, judging from the universal disregard that is shown in respect of it.

Notwithstanding the heavy shackles which the French government have thought fit to append to this branch of commerce, the art of bread-making has arrived at great perfection in Paris. Under Louis XVI., the labours of Parmentier and Cadet de Vaux had already greatly improved it. Lenoir, the lieutenant-general of police, had established in the Rue de la Grand Truanderie a gratuitous school for bakers, where they might witness the fabrication of the fine white bread of the Royal Military College, and the brown bread of the prisons of Paris. Nevertheless, at that period the Parisians were far behind the rest of Europe in the making of fine bread. At the present moment, however, they have nothing to learn: the bread displayed in the windows of the magnificent *boulangeries* of Paris is of exquisite delicacy; and, in particular, the succulent products of the Boulangerie Viennoise are the subjects of general desire and eulogium.

The trade of a baker is acquired at Paris in a year, or a year and a half, during which the pupil pays a premium of one hundred and fifty or two hundred francs. An accomplished workman is paid partly in coin and partly in kind: his daily wages are two francs seventy-five centimes (about two shillings and threepence), and a loaf weighing one kilogramme (a little more than two pounds). The salary of chief journeyman amounts to five francs a-day. Few of them pursue their labours beyond the age of forty; at which period of life they are thoroughly worn-out and exhausted, and compelled to beat a retreat. The fire of the oven is as fatal to the baker as the fire of the enemy is to the soldier: the man who sustains his race in his old age, ranks in infirmity with the man who destroys it; and after having passed his whole life in making the bread of others, he may find himself at its decline without an asylum and without a crust.

Against such contrary chances of fortune, and against the cares of their laborious existence, the operative bakers have sought a refuge in companionship. They form a part of a certain sect of devout devotees, who pretend to have for a founder a certain Master 'Jacques,' architect of the Temple of Solomon! This association, composed at first of carvers in wood, joiners, and locksmiths, has successively adopted the bakers, the farriers, the turners, the glaziers, the wheelwrights, the tanners, the curriers, the bleachers, the braziers, the dyers, the founders, the tinmen, the cutlers, the harness-makers, the saddlers, the nailers, the shearers, the basket-makers, the slaters, the hatters, the rope-makers, the weavers, and the shoemakers.

The Bakers' Companionship has in every town a place of rendezvous, where the members reside when out of employment, and whence they are hired. Their sign of recognition is an ear-ring, in the form of a grain-strike; and in their solemnities they carry large ivory-headed canes. On the 15th of May, in every year (the day of Saint Honoré), they walk in procession to hear mass, preceded by musicians, and the syndics of their body, adorned with flowers and tricoloured favours. On the following day they attend the celebration of a service for the dead, to which they bear a consecrated loaf, made of the finest flour; this is carried upon the shoulders of four of their companions, and ornamented with flags and innumerable ribbons.

There is a long-standing and hereditary enmity existing between the Companionship of Bakers, the followers of Master Jacques, and that of the carpenters, who style themselves the followers of Father Soublise. This hostility is of such great antiquity, that it admits only of a legendary explanation. Upwards of two thousand years ago, says the tradition, Master Jacques, who was travelling in France, was persecuted by the disciples of Father Soublise; a party of whom, to the number of ten, attempted to assassinate him,

and obliged him to take refuge in a marsh. Master Jacques, in the retirement of Sainte-Beaume, led an ascetic and contemplative life, when one of his pupils, by some called Jeron, and by others Jamaica, betrayed him to his enemies: a kiss which he gave the venerable solitary was the signal to five assassins, who stretched him on the earth with a stab of each of their daggers. Ever since, the sectaries of Father Soubise have been pursued by the adverse faction as accessories to this vile homicide. A spirit of revenge, evidently engendered from the primitive rivalry of two contemporaneous societies, divides the companionships into two armies, and, by a strange aberration, the principle of fraternal association has given rise to hostile and sanguinary encounters. In the month of August 1841, the bakers and the carpenters fought a regular battle in the fields adjoining the city of Toulouse, and it was not until many of the combatants on both sides had fallen grievously wounded, that the inhabitants of the suburbs were able to disperse them. The master baker lives a stranger to both the quarrels and advantages of the Companionship, and he is equally free from all participation in the manual labour of his craft; his functions being confined to the purchase of the farinaceous material, and the general superintendence.

The master's ambition is to be chosen syndic of the boulangerie, and to avoid every and any altercation with the civil functionary, mayor, or commissioner of police, who is continually on the look-out for contraventions of the law. It is a difficult thing for a baker to be never in default; to have always on hand exactly the month's provision required by the decrees; and never to be defective some hundredth of a grain in the weight of a loaf that he sells. Too often, it must be confessed, the default in legal weight is not the result of an error; too often judicial condemnations deliver over to public reprobation the practices of a rapacious knave, who, flattering himself that he shall escape the active surveillance of the authorities, shamelessly plunders the poor by the sale of light bread. Let us leave these unworthy citizens to the scourges of justice and public opinion, and oppose to them the honest baker, him to whom fraud is unknown, who gives long credit to the poor in time of need, and who has even been known, in seasons of distress, to obliterate an unpaid score from his books—preferring the treasure of their gratitude to a hoard of five franc pieces unworthily acquired.

Such was M. Bachelard, the model and archetype of bakers, the honour of the department of Ain, where he was born. At first a domestic servant, his fidelity so won upon the confidence of his master, that the latter, upon his deathbed, calling him to his side, said, 'You have shown me such unlimited devotion, that I have ever considered you rather a friend than a servant; become, I pray you, the guardian of my children, and the manager of their fortune.' The master died, and M. Bachelard fulfilled the office of guardian to the orphans with an integrity beyond comparison, and above all praise.

His pious duty accomplished, he married a respectable girl, and opened a hotel at Colligny, where we might wish him prosperity, and bid him farewell, seeing that we have here to do with bakers, and not with rambling gentlemen in search of 'entertainment for man and horse.' But it was not so to be. The establishment, it is true, prospered at first; but the allied armies burst like a cloud of locusts upon the department of Ain; they plundered the whole stock and provisions of the unfortunate hotel-keeper, who soon found all the fruits of his industry in the possession of his majesty the king of Prussia. Ruined in his first experiment, he turned baker, and when the indemnities were distributed to the victims of invasion, he renounced his own share in favour of the poor. This was the first of the good actions of this noble man which merit an honourable mention in this article. In the scarcity of 1816 and 1817, he manufactured gratuitously the bread which the

local authorities distributed daily to the indigent poor. 'It is my wish,' said he, 'to contribute to the solace of the destitute.' In 1828, the price of bread having risen suddenly to a great height, Bachelard sold it to the operatives of his district at twenty-five per cent. below the current rate. At this period he had been charged by the authorities to send weekly a certain quantity of bread to an infirm old woman: at the end of some weeks he received a counter order; he continued, nevertheless, to supply the usual quantity, and never revealed to the object of his charity the fact that she had changed her benefactor. Such a man is an honour to the profession; and if virtue be preferable to intellectual endowment, it ought to be prouder of M. Bachelard than of the baker-poet of Nîmes, whose talents and good qualities we wish by no means to call in question.

In England, capital and enterprise have now attained such a height, that extreme scarcity of food is not likely to occur. As soon as there is any appearance of a dearth, merchants, on their own account, despatch orders to foreign countries for grain, and the stores thus accumulated save the nation from famine. France has not yet reached this point, whether from lack of capital, or of enterprise, or both, it is unnecessary here to inquire. The consequence is, the law interferes to perform that which private arrangements should alone effect. It being felt that a dearth in Paris might produce a revolution, as it helped materially to do in 1789, every baker is not only compelled to provide a stock of flour in advance proportioned to the number of sacks which he consumes daily, but he is further obliged to make what is called a guarantee deposit, which, at Paris, is fixed in the following ratio, by an ordinance of the 17th July 1831:—

The baker using 4 sacks a-day, deposits 84 sacks.

...	...	3	65	...
...	...	2	48	...
...	...	1	18	...

Every sack must contain one hundred and fifty-nine kilogrammes of flour of the first quality. The quantity of flour so deposited in a great storehouse is watched with jealous care by the authorities.

What a feebleness in the social system of Paris is revealed by this compulsory arrangement! Left to the care of a single principle in political economy—supply following demand—the two millions of people in London live securely in the belief that, so long as money is in their pockets, the baker never will be without flour, and the breakfast-table never be without a loaf.

THE OLD SCHOOL.

'WHAT do you mean by the old school, papa?' asked little Joseph, looking up from the amusing and instructive occupation of putting together a dissected map. 'I have often heard you say that such a person belongs to the old school, and wondered what it could be. Is it a school for old people?'

The father smiled. 'Not exactly that, my dear, but the school in which old people were taught when they were young.'

'But was that anything different to the schools we have now?' the boy inquired. 'Do tell me, papa, all about it; for I suppose you went to it?' and Joseph left continents, oceans, and islands in one confused heap, to draw his little stool beside his father.

'No, I was not educated in the old school, still I can tell you something about it.'

'Were there desks, and forms, and books, and slates, and maps, papa? and were the boys taught in classes as they are at the school I go to?'

'You wholly mistake my meaning, my love,' Mr Darwin made answer. 'The word school, though literally signifying a place for education, is often used in another sense. Thus we speak of the *school of experience*, and the *school of affliction*, because these circumstances produce a change in the mind similar to that which is accomplished in a child by education. When we say, therefore, that an individual has been brought

up in the old school, we mean that he has imbibed the ideas of the age in which he lived. I will instance Mr Barnaby Prim. You have seen him, Joseph, have you not?'

'Oh yes, papa, many times: you mean that old gentleman who wears such odd coats and waistcoats, and that curious tail to his hair.'

'The same. Mr Prim is so wedded to the costume of his youth, that he still adopts it, notwithstanding that it is now quite obsolete.'

'What a droll figure he cuts, papa! I have often wondered what could make him dress so oddly, and I once had a great mind to ask him.'

'That would have been very rude, Joseph: it is a proof of ill-breeding to take notice of any one's peculiarities, especially in youth towards age. Mr Prim is a kind-hearted, right-thinking man on all subjects where the prejudices of his youth are not concerned; and these we can scarcely expect that he will give up after viewing them as great truths for so many years. One of his theoretical errors—or perhaps I should say the errors he imbibed in the old school—is, that the invention of machinery, and the introduction of steam, are the cause of all the poverty existing among the labouring classes of our country. Another—that beyond the reading of the Bible, and the capability of writing a man's own name, education is positively injurious to them; he also asserts that war is the best thing in the world for making trade brisk. On these, and some other subjects, he is pertinaciously obstinate; but had he been born thirty years ago, instead of fourscore, it is most probable that he would have held very different opinions. Your grandaunt will serve for another instance of tuition in this school. You heard her this morning blame me for giving your sister Laura instruction in astronomy. She deems it quite proper that you should have some knowledge of the magnitude, movements, and distances of the heavenly bodies; but she has been taught to think that such studies are not only utterly useless for a young lady, but would necessarily induce her to neglect her domestic duties. She would rather, she said, see her in the kitchen learning to brew and bake. Now, I will allow that, in the present day, young ladies are apt to go to the other extreme, and overlook useful home-duties in their eagerness to acquire a superficial knowledge of the sciences, of which they afterwards make not the slightest use; though,' he added—glancing archly at his daughter, who sat opposite, busily engaged upon a curious piece of web-work, and looking ever and anon very earnestly on a little book which lay on the table—'it appears as if the knitting mania would put the sciences to flight for a season.' Laura smiled.

'I am very glad I was not taught in the old school, papa!' Joseph warmly exclaimed.

'You are quite justified in deeming that circumstance to be a blessing,' Mr Darwin rejoined; 'but you must at the same time bear in mind that, though society has thrown off some of its prejudices, it has not yet arrived at a state of perfection, and we, in our turn, may a century hence be termed the old school. I would likewise caution you never to show disrespect to those whom you may deem to be ignorant, otherwise your superior knowledge will only bring upon you deserved contempt. For be assured, my dear boy, that a pupil of the old school, with all his prejudices, if possessed of the social virtues which tend to make those around him happy, is really more estimable than the individual who has theoretically imbibed the philanthropic and extended views of the present age, if he fails to discharge the minor duties which make the aggregate of life's happiness.'

THE ABATTOIRS OF PARIS.

I have seen the *abattoirs* of Paris, and the difference is beyond all telling: it is exceedingly great indeed. White-chapel is a scene of blood every day; there are streams of blood always flowing through the streets, from the number of cattle that are slaughtered there; and the terror

and nuisance in the streets to the passengers are very great, as the beasts are driven across the paved footpath into a common shop door, and then forced through the shop into the slaughter-house. At the *abattoirs* of Paris the beasts were driven in great quiet, there was abundance of space, and the poor animals never seemed in one instance to be alarmed, but were pinned down, and killed in a very short time.—*Evidence of Mr Gurney before the Select Committee on Smithfield Market.*

A MATCH OF AFFECTION.

WELL, my daughter is married, the popular prints
Are full of her blushes, her blonde, and her beauty,
And my intimate friends drop me delicate hints,
That my poor timid girl is a victim to duty:
They talk about interest, mammon, and pride,
And the evils attending a worldly connexion;
How little they know the warm heart of the bride!
She always was bent on a match of affection.

Dear girl, when implored her fond lover to hear,
At the mention of settlements how was she troubled!
Sir Nicholas offered two thousand a-year,
But she would not say yes, till the income was doubled:
Still she clung to her home, still her eyelids were wet,
But the sight of the diamonds removed her dejection;
They were brilliant in lustre, and stylishly set,
And she sighed her consent to a match of affection.

I really want language the goods to set forth,
That my love-stricken Emma has gained by her marriage:
A mansion in London, a seat in the north,
A service of plate, and a separate carriage.
On her visiting list countless fashionists stand;
Her wardrobe may challenge Parisian inspection;
A box at the opera waits her command—
What comforts abound in a match of affection!

Some thought Captain Courtley had won her young heart:
He certainly haunted our parties last season:
Encouragement, also, she seemed to impart,
But sober and quiet esteem was the reason.
When wooed to become a rich baronet's wife,
The captain received a decided rejection,
'She should hope as a friend to retain him through life,
But she just had agreed to a match of affection.'

Some say that Sir Nicholas owns to threescore,
That he only exists amidst quarrels and clamour;
That he lets his five sisters live friendless and poor,
That he never hears reason, and never speaks grammar;
But wild are the freaks of the little blind god,
His arrows oft fly in a slanting direction;
And dear Emma, though many her taste may deem odd,
Would have died had we thwarted her match of affection.

—MRS ASBY.

INTEMPERANCE.

Drunkenness seems to me a stupid, brutal vice. The understanding has a greater share in other vices, and there are some which, if a man may say it, have something generous in them. There are some in which there is a mixture of knowledge, diligence, valour, prudence, dexterity, and cunning; whereas this is altogether corporeal and terrestrial: other vices, indeed, disturb the understanding, but this totally overthrows it, and locks up all the senses; as Lucretius remarks—

'When fumes of wine have filled the swelling veins,
Unusual weight throughout the body reigns;
The legs, so nimble in the race before,
Can now exert their wonted power no more;
Falters the tongue, tears gush into the eyes,
And hiccups, noise, and jarring tumults rise.'

The worst estate of a man is that in which he loses the knowledge and government of himself; and it is said, amongst other things upon the subject, that, as must or wort fermenting in a vessel drives up everything that is at the bottom to the top, so wine makes those who drink it intemperately blab out the greatest secrets of another. So Horace—

'The secret cares and counsels of the wise
Are known, when you to Bacchus sacrifice.'

—Montaigne.

MY RETURN TO SCOTLAND.

After a lapse of a quarter of a century, I find myself once more in Scotland—in my own country. A quarter of a century! How can such a cycle have turned round? I know nothing but that the fact is so; and when I throw backward a glance of inquiry, I see nothing but shadowy appearances, filling up the space between youth and middle age. A quarter of a century works many changes in one who has been buffeted about the world, but so does it also effect revolutions even in the general aspect of affairs. I do not allude to family changes, to vacant places at the hearth, to the thousand gushing thoughts called up in the wanderer's breast at every shrine he revisits, dimming his eyes, and unnerving his limbs, and making him feel as if he were stumbling over old graves. These are the ordinary results of the mere lapse of time; and when their strangeness is over, the added shade they leave upon the heart is scarcely perceptible amidst the gloom of years. But there are changes around me that derive no portion of their effect from individual feelings. Scotland is a different country, the Scots a somewhat different people—much of the old sectarian severity still clinging to them, but in other respects ameliorated, polished, and, should I add, considerably more tasteful in personal and domestic arrangements? Wealth has performed her usual wonders; but there would have been no wealth without industry, and the Scotch, in the midst of all their queer local polemics, have been working at a terrible rate these last thirty years.

Even the external aspect of the country is changed. From being a desert, it is transformed into a garden, variegated with dark-green plantations, hedgerows, trees, and handsomely-built edifices. Look at that magnificent river—my own queenly Clyde! Where are the mystic bays, the lonely shores, the savage dells, that haunted my boyish imagination, when a stolen voyage down the Firth, in a small boat, with a single comrade, was like one of the adventures of Sinbad? It is now as beautiful as ever; but how different! Towns, villages, hamlets, seats, cottages, huts, line its banks; and groves and plantations behind meet the hills of the background. Civilisation has extended a continuous chain of posts down to the Atlantic, and steamers, darting out of every creek, fling bravely their banners of smoke upon the breeze. That river was a passion to me! I could not keep away from it. I ought by rights to have been drowned at least a dozen times; but I was reserved, it seems, for a different fate—to see what it should be like in a quarter of a century.

Perhaps it is only my old-fashioned way of viewing things, but I could not, in the midst of much to admire, refrain from feeling that the new refinements of the

people had rubbed away much that was formerly agreeable in their character. They appeared to me more stiff and formal, more reserved, more afraid of 'committing' themselves—more, in short, like vulgar-genteel people. In the Clyde steamers, in which you may have a six hours' trip from Glasgow to Arran, through some of the finest scenery in Europe, for two shillings, you find yourself in the midst of as uninteresting automata as it is possible to imagine: dry, cold, stony images of human nature, which weary you by their dullness, but prevent you from sleeping by their strangeness.

I did not remain long enough in the west, however, to get behind the scenes—to observe the mandarins on their own chimney-pieces. My destination was Edinburgh; and I reached this city high in middle-aged hope, and warm in youthful memories. I had left the southrons behind me; I had bowed myself out of the soirées of London; and it was with long-lost and delightful sensations I prepared to re-enter the hearth-circle of the 'kindly Scots.' The visitings I expected to reciprocate! the socialities I expected to enjoy! Oh, thought I, for a tea-drinking of auld langsyne!—to see the teapot once more in charge of the lady of the house—to draw in my chair, as if to a meal—to hear the urn hissing on the table, or the kettle singing on the hob—to be offered bread and butter twice! Never did common council-man hunger more keenly for a lord mayor's dinner than I did for the privilege of 'going out to tea!'

An old comrade of mine, some years older than myself, had settled and married in Edinburgh about the time when I first turned my vagrant steps towards the south. His income was small, but sufficient to live upon with reasonable economy: he had a wife and two grown-up daughters; and, in short, his was just the family where my social dream might be realised. I found him in a street more imposing in appearance than I had expected; but it was on the first floor of a common stair, and the rent was probably moderate. He received me with much heartiness, and introduced me warmly to his three ladylike womankind; and after rather a long visit for the forenoon, I came away rejoicing. The next day he left his card in my absence; and I determined to break the ice of ceremony once and for ever, by going uninvited on the following evening to tea. But in the meantime there came an engraved ticket, desiring the honour of my company to dinner in ten days.

Honour! Ten days! This chilled me a little at first; but on reflection, I perceived that my friend's yielding to fashion in the matter of a dinner had no necessary connection with his everyday life, and I continued for several days to expect an invitation of quite another kind to fill up the interval. When the fifth day came without result, I saw that I was myself to blame. I had

not even returned his call. They thought me a stiff, Anglified personage, who cared for nothing but a great dinner, and would look with contempt upon an invitation to tea. I determined to prove to them practically that they were wrong—to take them by surprise—to bounce in upon them like a China meteor—and to show them how well I remembered and appreciated old customs by comparing exactly 'on the chap of six.' This great idea I successfully realised, and as the clock struck in a neighbouring church, behold me entering my friend's house on the first floor of the common stair.

I did take them by surprise; and yet they were doing no harm. The father was sitting at one side of the fire, the mother at the other, and the two daughters were lounging on a sofa, all apparently engaged in a social chat. When I entered the room, the tranquillity of the scene was suddenly broken, although they were too polite, or too good-natured, to betray their surprise at the intrusion, otherwise than by a somewhat alarmed stare at each other. My friend received me as cordially as before; the ladies by degrees got rid of their embarrassment; and by and by we were in the full flow of conversation. But this was not brought about all at once. For some time the party continued to exchange looks of inquiry, and to sink into fits of silence, as if expecting to hear what had occasioned the visitation. I could not understand the nature of the excitement I had caused. My friend's round, good-humoured face, after a few minutes, beamed with pleasure as it was turned towards his old crony. There was no appearance of tea; but, on the contrary, it seemed to me, from a heavy and pungent odour in the room, as if the honest man, at no great distance of time, had been solacing himself with a glass of toddy. I sat still, however, waiting for what might betide; and so happy was I in patient, not to say delighted, listeners to my adventures in foreign parts, that when the church bell struck eight I started in surprise.

Still no word of tea—no overture of the kettle. It was now plain that the fragrant meal had been over before I appeared, and that I had mistaken the aroma of tea for that of toddy. Still, I was happily in for a long evening. I should of course pretend to rise, but only to be asked to remain. I should be pressed to stay, and—and—'eat an egg.' Yes, that was the periphrasis. Eat an egg! You do not know what poetry there was to me in these words—words wedded to so many old affections, to so many home sympathies! 'Yes, friend of langsyne!' thought I; 'yes, wife! yes, daughters of my ancient comrade! I will stay with you and eat an egg!' I got up, however, and in the hypocrisy of my heart, amidst the love that was thence welling forth, and blending in one tide the present and the past, there came faintly the conventional words, 'I think it is getting late.' My friend rose and grasped my hand: he shook it. His wife rose also, and a small thin pressure answered to the silent gripe with which I bade a wondering good-night. The daughters smiled and bowed, and muttered something kindly and sweetly without rising; and in another instant I found myself on the outside of the door. As I passed through the hall, I saw a black tray upon the table, with delf cups and saucers, and a Britannia-metal teapot, and on the floor a dirty tin kettle. I had all this time been keeping the family of my old crony from their tea; and it was with a sour and impatient look the servant lass let out the untimely visitor.

I saw nothing more of my friends till the great dinner,

and that was so like other great dinners, that it is not worth describing. Indeed, if it were not a bull, I might say that it was more like than the originals. There was more care in the filling out—more elaborate crispness in the corners. If it had less ease than in houses more accustomed to such entertainments, it had more finish. It was wanting, it is true, in wealth and richness, but everything was there of a certain sort; and the affair may be said to have gone off as well as such things usually do.

At this dinner party I had the pleasure of sitting beside an aged gentleman, to whom I partly hinted my feelings of disappointment about the tea-drinkings. 'Ah, my dear sir,' observed my new acquaintance, 'all that kind of thing is quite gone now. Edinburgh is fast getting a modern English town. I often say it is little else than a suburb of London, down the Thames. Perhaps, like all imitators, the people here overdo London fashionable life a little; still, you will allow, they don't do things badly.'

'But I want the old social manners.'

'These you will get only in fourth or fifth-rate country towns; and even there they are dying out. In proportion as carpets, pictures, and silver spoons intrude themselves, the old kindly customs disappear. I fancy it is the same thing all the world over—one of the penalties we pay for civilisation.'

It may be supposed that I was somewhat disconcerted by this outset in my search after sociality. I had been eating dinners, and dawdling through soirées, for many years, and now my heart yearned for something more—something better. Still I clung to my old friend and his family. The father and mother were very tolerable—very tolerable indeed; and the girls were engaging, and almost pretty; and the elder of the two, more especially, was endowed with a certain womanliness of nature which makes even downright ugliness charming. It was this wretched dinner, thought I, that upset them. While it haunted their imaginations, it was impossible for them to think of drinking tea, or eating an egg. Now that it is fairly over, let me give them a few days to subside, and then try another experiment. I think I could get attached, in the fashion of an old man, to that gentle baggage Mary. Let me call again in the forenoon—nay, in the morning—early, before the odious hour of card-dropping, and observe how she looks when as yet she belongs to the family, not to the public.

I was not destined, however, to see her in her morning-gown and slippers; for although hardly mid-day when I called, the two sisters were in full walking costume. There appeared to be an excitement of some sort in the family that morning. The girls had the air of being newly out of a bandbox; and the father and mother were anxiously scrutinising them, and every now and then readjusting some nameless trifle in their dresses. They told me at length, with considerable importance, that they were going several miles out of town to call on Mrs A—B—of C—; and this explained the matter, for the lady named is a very great lady, of good family, and lives in a mansion which is a real country-seat. But this was not all. A young English nobleman, a certain Lord Orville, was at the moment a visitor at that country-seat; and here were our Mary and Jessie on the very brink of getting acquainted with a baron. I confess I looked at their dress myself with some critical scrutiny after this announcement, and with my own hands I moved Mary's veil a little way aside to afford a view of her left eyebrow.

Perhaps this delicate attention interested the young women in my favour; for after some remark as to its being so tiresome for papa to have the rheumatism just on that particular occasion, I could see them, as they whispered together, eyeing me from head to foot. Now, although I admit myself to be just at that age when men grow coxcombs out of sheer desperation, still it is not from vanity, but in mere justice to my tailor, I affirm that my coat that morning was perfectly unexceptionable. Such appeared likewise to be the opinion of the young ladies; and after their mother had assisted at the secret council, I was requested to give them my escort. To this I need not say that I delightedly agreed; and after it was arranged that, in order to let the girls have the benefit of the air, we should walk to C—, and return in the omnibus, off we set. The arrangement, I perceived, was likewise convenient from its involving the saving of sixpence, which is a thing of some consequence to persons of stunted income, who give great dinners, and drink tea out of delf and Britannia metal.

The walk was extremely pleasant, and the character of the two young women came out charmingly through the influence of mere contact. The fact is, generally speaking, we poor human beings want only to become well acquainted in order to like one another. The principles of repulsion, as they are called, are only skin-deep; and such external disagreeablenesses are easily forgotten when we come to know the real worth within. I was more than once on the eve of giving Mary a lecture on the subject, and advising her to trust more to nature and her own heart, and think less of the conventionalisms of that small and obscure nook of society her inexperience called the world. But at the time she was happy and amiable (the one, because of the other), and I did not like to break in upon the visions of her fresh and buoyant imagination, which I could see were busy with the young baron. His name was constantly on her heedless lips; his unknown image danced before her sparkling eyes. And all this because he was a lord! Well, the lord—I mean the young lord—of a girl like our Mary, it should be remembered, is not a mere peer of the realm: he is at the least a hero of romance.

But we were not to reach our destination without an adventure. All on a sudden it began to rain; and such rain! It seemed as if a trap-door had been opened in the clouds to let down the torrent bodily. A shed, by good luck, was at hand, but we by no means escaped Scot free; and had it not been for the presence of mind of a male refugee, who brushed the drops from the velvet polka with his handkerchief—is it a polka you call that thing?—Mary would have been in no condition to appear before his lordship. When our equanimity was somewhat restored, I had time to look at our new friend. He was a young fellow of some six or seven-and-twenty, plainly, nay, commonly dressed—in one of those coarse, mean, up-and-down apologies for a great coat, which are puffed by the cunning tailors—but decidedly a gentleman. I have a theory of my own in physiognomy, and my heart warmed to the young man the moment I saw him, and all the more that I could see his heart warmed to our Mary. And no wonder. Flushed with running, fresh and natural from excitement, and warm in womanly gratitude, she was at that moment beautiful. But alas! this did not last long. She remembered, no doubt, that the gentleman had not been introduced to her, and shrinking aside almost rudely, conversed in a low tone with her sister. Still, her natural feelings did not yield to conventionalism without a struggle; and I did not wholly despair of her, till I heard her say aloud, with a thinly-covered consciousness, 'I hope Lord Orville will be at home!' I

was ashamed to look openly at our new friend, but a furtive glance showed me that a half smile was upon his haughty lip.

I was by this time, after an old-fashioned custom of mine, trying to make his acquaintance; and not succeeding by ordinary stratagems, I at length told him plump that I wanted to mention to my old friend the name of the gentleman who had been so kind to his daughter's polka.

'My name is Hope,' said he.

'A name of good omen. And—?'

'When I studied the humanities up yonder'—pointing townward—my comrades called me Sandy; but since then I have been more generally addressed as Alexander.'

'Alexander Hope.'

'The rain has ceased!' cried Mary at that moment; 'let us run between the showers.' And gathering up her skirts, she made a slight, silent, chilling, haughty bend to the gentleman who had not been introduced to her, and followed by her sister, who imitated her exactly, made hastily for the avenue, which was close by. Mr Hope looked for a moment as if he would have stepped after her; but a half smile again curled his lip, and a scarcely perceptible shrug said, as plainly as if it had spoken broad Scots, 'She is going to that lord!' He turned to me, therefore, and with a sort of kindly respect bade me 'good-by,' and then 'passed on his way, and I saw him no more.'

I followed the girls in silence up the avenue. The house was large, grave, stately. It stood upon its own dignity, and cared nothing about lords. No one could have told, by the manner of the servant, that a lord lodged there; and when at length we were in the presence of Mrs A— B— of C—, I found her a prettyish, youngish, well-bred, but natural woman. The conversation soon turned upon Lord Orville, and she told us he was very amiable, a little eccentric, and wholly romantic.

'I wonder you did not meet him upon the road,' she added.

'Perhaps we did,' said I; 'how was he dressed?'

'Why, in one of those coarse, up-and-down things—I don't know what you call them.' The girls threw a glance of alarm at each other, and flushed violently.

'I am afraid you have walked too far?' said the lady kindly; 'you must let me prescribe a glass of wine and a bit of cake.'

'Oh no!'—'Not for the world!' were the exclamations of the poor things, who were by this time desperately hungry, and at that moment especially in great need of a mouthful of wine.

'And you, sir?'

'Why,' said I, hesitating—for I never like to refuse anything good—if I thought it was perfectly correct—The lady gave a merry laugh, which rang through the room.

'Oh,' said she, 'at this distance from Edinburgh, we are out of the pale: we know nothing about the genteel here!' and so I indulged in a glass of capital sherry, and a bit of very plain home-made cake, such as would have really done the poor lassies good. Our kind hostess then opening a book, handed it to Mary, telling her that if she had any interest in learning the young man's age, she would find it there.

It was a Peerage; and with irrepressible curiosity I leaned over the heads of the girls, and read in large letters: ALEXANDER HOPE, BARON ORVILLE.

There was hardly a word exchanged on the way home, even by the sisters with each other; and when we reached the first floor on the common stair, they were but little more communicative to their anxious and curious parents. They were too much absorbed, however, in their own feelings, to remember any longer that they must not satisfy their hunger; and so they kept on eating bread and butter voraciously, and in silence, till I took my leave.

This is a trifle, no doubt; but I fear it is the feather

which shows how the wind blows. It will be seen that my experiments have as yet been failures. If I am more successful at another time, you may be sure I shall not keep the news to myself.

I C E.

'Oh who can take a fire in his hand
By thinking of the frosty Caucasus?
Or wallow naked in December's snows
By bare remembrance of the summer's heat?'

WE are unable to answer these questions. In point of fact, we are not acquainted with any lady or gentleman who either could or would do such things. But still it is pleasant to look forward to the sunshine of summer when crouching over a winter's fire; and in like manner, at this moment, with the breezes of approaching May flinging warmth and perfume before them, we derive a feeling of additional comfort from recalling in imagination the ice of last January.

The solid covering of the ponds and rivers is now carrying freshness and fertility over the surface of the country; and not only developing the germs of vegetable life, but, in its new forms of purling stream and meandering rill, awakening in the mind those poetical ideas that nature has endowed with an immortality of novelty. But there is a balance of ice to be accounted for. Some of it, the poets tell us, is dissolved into liquid silver; a treasure with which Hodge makes no scruple of irrigating his fields. Some has gone to the clouds in vapour, and descended anew to the earth in rain: but another portion, and not a very small one, remains still in its original frozen masses, and will do so throughout the hottest part of the summer. When Fenelon once was walking with some friends, they all stopped to listen eagerly to the remark of the refined sentimentalist, as they saw his attention attracted by a flock of sheep feeding on a hill-side. 'Alas!' said he with a sigh, 'there are a hundred beautiful, innocent creatures, and perhaps not one tender gigot among them!' The balance of ice, say we, after deducting the streams and showers, and the amount of liquid silver, as per account, is lodged in the ice-cellars of the fishmongers and pastry-cooks.

Ice is a great and increasing article of trade throughout a considerable portion of the civilised world. The Calcutta newspapers watch anxiously the supply of the market; and in the West Indies, likewise, it has become as indispensable as any of the other luxuries which habit converts into necessities. In China, where the refinement, such as it is, dates back to a distance which bewilders the mind, the European visitors of the country found ice in more common use than in London. Near Peking, when the thermometer stood above 80 degrees, Davies saw numbers of people carrying about the refreshment in solid lumps, placed in a basket at each end of a pole carried across the shoulders. At every fruit stall it was sold in similar pieces, or used to cool the goods; and the embassy was liberally supplied with it for their wine. During the summer, it is deposited, as is customary elsewhere, at a certain depth in the ground, and surrounded with straw and appliances for draining off the portion dissolved.

In Lima, according to Von Tschudi, ice is considered so essential, that a scarcity of it for a few days would have the same effect as the deprivation of bread elsewhere, and excite popular tumults. For this reason the mules used in its transport are held sacred even in the heart of a revolution, for neither party would risk the popular odium that would attach to any interference with their services. This ice is obtained on the Cordilleras, at a distance of twenty-eight leagues from the city; and on being broken from the glaciers by the Indians, in great blocks, is lowered down the side of the mountain with ropes. It is then covered with a kind of grass, and packed on the backs of mules, each mule carrying two blocks, and is then transported to Lima by means of relays of mules stationed at intervals of two or three miles. Here it is used to the extent of

between fifty and fifty-five hundredweight daily; about two-thirds of which are applied to the preparation of ices, chiefly of milk or pine-apple juice. The rest is hawked about the streets for sale by Indians, who carry it in pails on their heads, and whose cry of 'helado' is constantly heard in all quarters of the town.

In the great cities of Europe the ice market is of considerable importance. In London, the foreign trade in this article is confined to a few individuals, and is usually conjoined with that of a fishmonger, although the latter is said to be the less profitable of the two. A thousand tons is not an uncommon stock to be stored in a metropolitan well, and the quantity actually sold by a single individual averages in some cases seven hundred tons in the year. The sinking of such wells is attended with great expense, and in general they are situated in the outskirts of the town, so as to be nearer the ponds and rivers from which their home supply is obtained.

The price of ice, when obtained from these sources, is about 8s. a ton, but this rises in proportion to the mildness of the season. During such winters as that of 1845 and 1846, when there is little or no ice to be obtained in England, the proprietors of ice wells are put to great trouble and expense in order to keep up their stocks, the demand being as constant for this as for any other luxury of the summer season. At such times it is usual for the traders to freight vessels to Norway or other places, where ice is to be procured at all times; and it is not uncommon likewise for speculators to import cargoes on speculation during a mild winter. The price, under such circumstances, is of course materially increased; and by the time it reaches the well, the cost is frequently as much as L.3, 10s. or L.4 per ton. When this is the case, we believe it seldom affords a profit to the dealer. But the price of ice is not regulated merely by the supply, but likewise by the quality of the article—by its *coldness*. Persons unacquainted with the subject will be surprised to learn that there is a difference in this respect, and to such an extent, that their common expression, 'as cold as ice,' is quite vague and meaningless, unless they specify the *kind* of ice they mean!

'Now, for want of half a moment's reflection,' says Sir Francis Head on this subject, 'people in England are very prone to believe that water cannot be made colder than ice; and accordingly, if a good-humoured man succeeds in filling his ice-house, he feels satisfied that his ice is as good as any other man's ice; in short, that ice is ice, and that there is no use in anybody attempting to deny it. But the truth is, that the temperature of 32 degrees of Fahrenheit—that at which water freezes—is only the commencement of an operation that is almost infinite; for, after its congelation, water is as competent to continue to receive cold as it was when it was fluid. The application of cold to a block of ice does not, therefore, as in the case of heat applied beneath boiling water, cause what is added at one end to fly out at the other; but, on the contrary, the extra cold is added to and retained by the mass, and thus the temperature of ice falls with the temperature of the air, until, in Lower Canada, it occasionally sinks to 40 degrees below zero, or to 72 degrees below the temperature of ice just congealed. It is evident, therefore, that if two ice-houses were to be filled, the one with the former, say Canada ice, and the other with the latter, say English ice, the difference between the quantity of cold stored up in each would be as appreciable as the difference between a cellar full of gold and a cellar full of copper; in short, the intrinsic value of ice, like that of metals, depends on the investigation of an assayer: that is to say, a cubic foot of Lower Canada ice is infinitely more valuable, or, in other words, it contains infinitely more cold, than a cubic foot of Upper Canada ice;* which, again, contains more cold than a

* 'Continue to receive cold,' 'contains more cold,' &c.; these expressions are incorrect. Cold is a mere negation of heat. The correct phraseology should have been, 'continue parting with heat,' 'contains less heat;' and so on.—Ed.

cubic foot of Wenham ice; which contains infinitely more cold than a cubic foot of English ice; and thus, although each of these four cubic feet of ice has precisely the same shape, they each, as summer approaches, diminish in value—that is to say, they each gradually lose a portion of their cold, until, long before the Lower Canada ice has melted, the English ice has been converted into lukewarm water. The above theory is so clearly understood in North America, that the inhabitants of Boston, who annually store for exportation immense quantities of Wenham ice, and who know quite well that cold ice will meet the markets in India, while the warmer article melts on the passage, talk of their “crops of ice” just as an English farmer talks of his crop of wheat.

But Sir Francis is mistaken in supposing that any general degree of ignorance prevails in England upon this subject; for the fact is, the price of the Wenham Lake ice is much greater than that of the ice obtained either at home or in the northern seas, and yet the company has now an establishment in almost every town of importance in Great Britain.

Towards the poles, the natural state of water is ice; and beyond the 60th degree of latitude, its thickness is several hundred feet—although mariners have assigned to masses that have been found floating at sea an elevation of fifteen hundred to eighteen hundred feet! In the north of Russia, the temperature of the atmosphere is sometimes 50 degrees below the freezing point; and even in St Petersburg, the famous ice palace constructed at the marriage of Prince Gallitzin attests the extraordinary hardness to which water may attain.

‘No forest fell,
Imperial mistress of the fur-clad Russ,
When thou wouldest build; no quarry sent its stones
To enrich thy walls; but thou didst hew the floods,
And make thy marble of the glassy wave.
Silently as a dream the fabric rose;
Ice upon ice, the well-adjusted parts
Were soon conjoined, nor other cement asked
Than water interused to make them one.
Lamps gracefully disposed, and of all hues,
Illumined every side. Long wavy wreaths
Of flowers, that feared no enemy but warmth,
Blushed on the panels which were once a stream,
And soon to glide into a stream again.’

This elegant description of Cowper applies to a palace of ice fifty-two feet long, sixteen feet wide, and twenty feet high. The blocks of water-stone were hewn from the Neva from two to three feet thick, and sculptured with various ornaments; an operation which must have been attended with no small difficulty, as even in this country, in very cold winters, iron instruments that are used in cutting ice require to be frequently sharpened. The furniture of the palace, however—the tables, chairs, &c.—was of ice, as well as the walls; and it was defended by six pieces of ice cannon, one of which sent a hempen bullet through a two-inch board at the distance of sixty paces.

LAGOMA.

A TALE OF THE COAST OF AFRICA.

THE great river Gambia, after running a course of six hundred miles through the tropical regions of Western Africa, disembogues into the Atlantic at about 12 degrees of north latitude. At its mouth lies the small island of St Mary, now occupied by the British colony of Bathurst. This settlement, originally of a mercantile character, has since become a station for recaptured slaves, auxiliary to Sierra Leone, which is situated a few degrees farther south. In the principal town reside thirty or forty English merchants, who exchange the manufactures of their own country for the gum, bees-wax, hides, ivory, and gold of Africa. Besides these, there are the governor of the colony and his assistants, together with a small guard of soldiers for the defence of the place.

On a pleasant day in June, some six or seven years ago, a small party of Europeans rode out of the town of

Wellington towards the villages of the recaptured Africans. It consisted of two naval officers from a frigate then lying in the river, the colonial secretary, and the chaplain of the station. Their course led them across a level country covered with long loose grass. A few trees were scattered over the plain, among which were conspicuous the tall, graceful palm, with its feathery coronal of leaves, and the huge, swollen trunk of the baobab (known there by the singular name of *monkey-bread*), which sometimes attains to the monstrous girth of sixty feet, although not remarkable for either height or foliage. At length they came in sight of some fields of maize, sweet potatoes, bananas, and ocra, among which appeared the conical roofs of the native huts.

‘Yonder, gentlemen,’ said the secretary, ‘is the village to which we have given the name of Melville. You will observe that the people are allowed to live according to their own ideas of comfort, receiving from us such assistance and instruction as they are willing to accept.’

‘Do you find them amenable to instruction?’ inquired one of the officers, a middle-aged man with a weather-beaten countenance, who wore the uniform of a lieutenant.

‘Why, yes,’ replied the colonial functionary. ‘But the parson is best qualified to speak on that subject. He devotes a great deal of time and labour to his black sheep, as I call them.’

‘The character of the native Africans,’ said the chaplain, ‘varies with the tribe to which they belong. Those of the interior are more civilised and tractable than those of the coast. The Ashantees are warlike and bloodthirsty; the Foulahs, haughty, bold, and enterprising; the Mandingoes are shrewd, given to traffic, and with strong religious feelings. But, speaking in general, I consider the negroes a tractable, good-humoured race, easily led by appeals to their affections. That mild, gentle, flexible character which renders them so valuable as slaves, makes them also good free citizens, provided the government under which they live be not so managed as to excite their evil passions, and particularly to mortify their vanity, which is a ruling principle with them. Occasionally, however, we find among them men of a different stamp—obstinate, headstrong, unmanageable. Such a man—a very remarkable personage, by the way—you will probably see in the village which we are approaching.’

‘You mean Lagoma?’ observed the secretary.

‘What is his history?’ asked the younger officer.

‘He is a native of the Eboe country, near the mouth of the Quorra, or Niger,’ replied the secretary. ‘He was liberated about four years ago from the slaver Africans, which, you will recollect, was captured by the Bronté off the Cape Verde Islands. From his story, it appears that he was the chief, or I suppose we might call him the king, of a sept or subdivision of the Eboe tribe not far from the great river. An older relative, a cousin or uncle, governed a larger district, situated on the western bank of the Quorra. This kinsman of his managed to involve himself in debt with some of the rascally Portuguese slave-traders, who kept him in constant annoyance by their demands for payment. As this was to be made in slaves, and he was at that moment too weak to undertake a war with any of his neighbours, the hereditary enemies of the Eboes, he could hit upon no other scheme for discharging his obligations than that of raking up an old quarrel with his cousin, and falling upon him so suddenly, as to give him no opportunity for resistance. Poor Lagoma was taken prisoner with all his family and half his subjects. His younger brother was killed in the conflict. His wife and their two children, along with more than a hundred of his people, died of fever, and the effects of ill-usage, on board the Africana before she was taken. These sufferings and injuries have sunk into his mind, and produced a powerful effect. He never smiles, and never joins with the other blacks in their amusements or conversation. His whole mind is absorbed with the idea of vengeance. From the time that he landed, and was

made to understand his position here, he has devoted himself to a single object—that of procuring, by his labour, sufficient funds to hire a passage in a trading vessel to his native country, with a supply of arms, which will enable him, by joining some of the tribes opposed to his cousin, to take condign vengeance on the treacherous scoundrel. He is assisted by about twenty of his people, who were liberated with him, and whom he has inspired with the same feelings. They have really made wonderful progress towards the execution of their design, and have already accumulated a considerable amount of money by the sale of their crops. They are exemplary for their industry and sobriety, and could they but be disabused of this extravagant idea of revenge, would be a most valuable acquisition to our colony.

'Here you see him,' observed the chaplain, pointing with his whip to a man engaged in weeding a field of maize in the vicinity of a hut. He did not even look up until the secretary called him by name, when he slowly raised himself, and moved towards the party. Both the officers were struck with the air of composed dignity with which he returned their salutations, and led the way to his hut. He was tall and well-proportioned, with the appearance of great strength. Although perfectly black, with thick woolly hair, his features had not otherwise what is commonly considered the negro cast. His eyes were small, and set deep beneath his overhanging brow; his nose was not flat, but rather of an aquiline shape; his lips were not very thick; nor did the lower part of the face protrude, as is common with the race to which he belonged. He wore the ordinary garb of the African colonists—loose white cotton trousers, turned up to the knee while working, and a straw-hat. His house, to which he led them, was, like all the rest, of a circular shape, with walls composed of a wattling of bamboo, and a conical roof thatched with straw, the whole bearing a great external resemblance to a round hay-stack. The furniture was extremely simple, more so than is usual with the negroes; for all Lagoma's earnings had been carefully reserved for the purchase of arms: a cooking-pot, and a few baskets, with a raised bedstead covered with mats, were all. He pointed his visitors to the bedstead by way of a seat, and placed before them a bunch of plantains and a calabash full of palm wine; then seating himself on a mat by the door, he calmly waited till they should address him.

'Always hard at work, Lagoma,' said the secretary.

'Yes; work hard; large crop; plenty money,' replied the negro chief laconically.

'Then you still hold to your scheme of revenge, my friend?' inquired the chaplain.

'What you call revenge?' retorted Lagoma sullenly, as if annoyed at the prospect of renewed expostulation.

'I no call it revenge; call it punish.'

'But consider,' urged the chaplain, 'is not your feeling a bad one? Revenge or punishment is the same thing if undertaken in a savage, unchristian spirit. Think how much happiness, how many comforts, you might enjoy with your crops and money, if you would but renounce this vindictive enterprise.'

'Misser Officer, you a lieutenant, hey?' asked Lagoma, turning suddenly to the oldest of the two naval officers, who answered in the affirmative.

'You got wife and children?'

'Yes.'

'Ha! suppose somebody come in the night, set fire to the house, kill wife, children, brother, sister, all—what you do to him, Misser Lieutenant, hey?'

'I would shoot the villain,' answered the lieutenant hastily; 'that is,' he added, after a moment's thought, 'if I caught him on the spot.'

'Yes, yes! Suppose you catch him on the spot. But suppose you no catch him till five, six year; what then?'

'Then I would hand him over to the government, to be dealt with according to law.'

'What the governor do to him?' inquired the chief.

'He would be tried before a judge, and if found guilty, would be hanged.'

'Good!' replied Lagoma, rising to his feet, and drawing himself up with great dignity. 'In my country, I, Lagoma, the governor; I the judge; I speak the law. Toklah come in the night, like a thief, give no sign, burn my house, kill my brother, sell me, my wife, my children, my people, to the slaver. All die. Nobody left to live with Lagoma. You say forget!—no punish!' he continued, turning quickly to the clergyman, and speaking with much earnestness. 'You are very good man. But when I die, I forget—not before.' So saying, he walked hastily out of the hut, and was soon lost among the rows of lofty maize stalks that surrounded it. It was evident that he did not wish his agitation to be seen.

'This is the invariable result of every attempt I have made to soften his vindictive passion,' observed the chaplain; 'yet he is not without good feelings. In fact his very desire of vengeance springs, as you may have observed, from the strength of his affections, and is kept alive by his constant sense of loneliness.'

This observation met with general assent, the younger seaman, who was a midshipman, evidently inclining to the opinion that Lagoma's determination was not so very objectionable as the chaplain seemed to consider it. As there was no likelihood of his reappearance, the party mounted their horses, and returned to the port to dine. Here they found that a slaver had just come in, with a prize crew, under the charge of a lieutenant of the *Althea*, by whose boats the slaver had been captured after a desperate resistance. She was a vessel of about two hundred tons, polacca rigged, and had on board nearly three hundred slaves. The space between decks was so low, that it was impossible to stand upright in it, and so crowded, that there was no room to lie down. The sufferings of the miserable wretches, crammed into this suffocating hole under a vertical sun, amid filth and noxious effluvia, heavily shackled, with deficient food, surpass the power of the imagination to conceive.

After dinner, the party, increased by the addition of the governor, and of Lieutenant W——, the prize-master of the slaver, walked down to the slave-yard to view the recaptured Africans. They had been supplied with food and clothing on board the vessel after her capture; and those who were suffering under serious illness had been removed to the hospital immediately on landing. But notwithstanding these alleviations, the sight was wretched enough. Their emaciated figures, the eagerness with which many of them still devoured their rations, never appearing satisfied, the weakness in their limbs caused by the shackles, and by the constrained postures which they had been compelled to maintain, the listless attitudes, the vacant, dreary stare, all spoke so plainly of the misery to which they had been subjected, that it was impossible to view them without pain. The governor, however, observed, 'These poor creatures seem wretched enough. They have evidently been treated worse than usual. Yet in a week, one-half of them will be singing and dancing; and in a month, all but one or two will be as merry as crickets. Now, that's a singularity in the negro character which I should like to hear explained. It cannot proceed from insensibility, for no people have more feeling.'

'It is a natural cheerfulness and sprightliness of temperament,' replied the chaplain. 'It is curious to reflect that if these poor people had been of a harsh, morose disposition, like the Malays, or the American Indians, they never could have been made slaves. Their very virtues have been turned against them.'

'True enough,' replied the governor. 'Mr W——, from what part of the coast did you say these people came?'

'From the Quorra, sir; a little above its mouth. Most of them are Eboes.'

'A bad set those Eboes,' observed the governor. 'Crafty and ferocious. Always fighting among themselves.'

'I think,' replied the lieutenant, 'that that proceeds more from the machinations of the slavers than from any other cause. Now, that old man whom you see there, and who is the principal person among them, was conquered, taken prisoner, and sold by his own son.'

'His own son!' exclaimed the hearers.

'Yes. It appears that the old fellow had governed his subjects after a rather tyrannical fashion, and made a number of malcontents. The traders, who are constantly among them, and are acquainted with all that is going on, took advantage of this state of feeling, and persuaded them to rebel. The revolted party, after the fashion of our own ancestors in the middle ages, got hold of a son of the old chief, and in a manner compelled him to be their leader. They were victorious. The old man and most of his adherents were taken prisoners, and of course sold to the traders.'

This information drew the attention of all the party towards the old chief, who presented a pitiable sight. His meagre, attenuated figure was wrapped in a thick blanket, and yet, though the day was very warm, he shivered as though in the cold stage of a fever. A deep gash, yet unhealed, extended from his temple to his chin, and disfigured still more a naturally unprepossessing countenance. His low projecting forehead was partially bald, and his hair was slightly grizzled. He lay reclining on the bosom of a young woman, who appeared to watch over him with great care. His small eyes roved with a lustreless gaze around the yard.

'What consummate knaves those traders must be, to be able thus to stifle the feelings of natural affection in a people in whom they are so strong!' observed the governor.

'True, sir,' replied Lieutenant W—; 'and there is an evidence of their strength. That young girl, who supports the old man so tenderly, is his daughter. Her name is Nandee. She accompanied him voluntarily, in spite of all the efforts of her brother to dissuade her. She became a slave in order to attend her father in his old age and illness.'

It will easily be conceived that this information excited a great interest in favour of the young negress. She was a mere girl, of apparently not more than sixteen. Her slender, graceful form was clothed from the waist in a wrapper of blue cotton. Her face was not handsome, but it had that pleasing expression of patient, loving meekness so often seen in the females of her unhappy race. She shrank with such evident confusion when she found their eyes fixed upon her, that the spectators, with a common feeling of delicacy, withdrew to another part of the yard, where the lieutenant pointed out an old negro, who, he said, was a Mohammedan Moolah, and able to read Arabic with facility. While they were examining him, a loud cry was heard, which recalled their attention to those whom they had just left. It proceeded from the old man, who was sitting upright, and staring with a look of affright at a figure just then entering the yard. This was none other than our friend Lagoma, who had come from Melville on hearing the report of the arrival of a slaver from the Quorra, in the hopes of receiving some intelligence of the friends or the enemies whom he had left there. His wishes were more than gratified. No sooner had he beheld the old man, than, with a shout of 'Toklah!' he darted towards him like a lion rushing on his prey.

The looks of all present, negroes and English, were riveted on the scene that followed, which was a very striking one. The tall form of Lagoma, with every feature convulsed by passion, towered over his prostrate enemy, who, falling back into the arms of his daughter, fixed his gaze, as if fascinated, on the terrible countenance of his injured kinsman. Nandee, with one arm around her father, stretched the other imploringly towards her cousin. After a brief pause, Lagoma spoke. His words were unintelligible to the English, but it was evident that they were expressive of rage and violent denunciation. At one time his excitement became so great, that the chaplain was on the point of interrupt-

ing him, but was prevented by the governor. 'Let him alone,' said the latter. 'I think I know Lagoma. We shall see a different termination to this scene from what you anticipate.'

At length the negro chief paused for a moment, as if expecting a reply. The old man, however, was so overcome by the shock, acting upon his enfeebled frame, as to be incapable of utterance. Nandee, therefore, answered in his stead; and though her words, like those of Lagoma, were unintelligible, yet their general import was readily perceived. Her piteous, appealing tone, the tears that slowly gathered and rolled down her dusky cheeks, the manner in which she pointed to the attenuated form and gray hair of her father, made it evident that she was endeavouring to move the compassion of her angry kinsman. At first he listened in sullen silence. Then, in answer to a few brief questions, she seemed to enter into a long narrative relating to the fortunes of their family—at least so the lieutenant judged from a few words of their language which he had picked up. As she proceeded, the cloud gradually passed from the brow of the listener. He gazed at her with looks of interest, which at length seemed to become admiration. Then looking again at her father, he shook his head. For a minute he stood irresolute, with knitted brows, and eyes fixed on the ground. He seemed to be undergoing a powerful struggle between contending emotions. At length he turned, and slowly approached the group of officers who had been watching his proceedings.

'Well, Lagoma,' said the governor, 'if I understand the case rightly, your desire for revenge ought to be fully satisfied. Your old enemy has met with a heavy retribution. His fate seems to be worse than your own.'

'No, no,' replied Lagoma quickly; 'he no lose all.'

'You mean his daughter, I suppose?' said the governor. 'Very true. She seems to be a jewel—a real treasure. As you say, the old rascal is fortunate in having such a child—more so than he deserves. Well, Lagoma, what do you mean to do with your relations?'

'Suppose you like, governor,' replied the negro in a hesitating manner, 'I take them home with me.'

'What! and wreak your vengeance on the poor old man at your leisure?' returned the governor with great gravity. 'For shame, Lagoma! Certainly I shall not allow any such thing.'

'No, no,' replied the chief; 'no more revenge—no more bad feeling. Toklah plenty punish. Ah, only think, his own son fight him, catch him, sell him to the trader! His own child! Oh, plenty punish. I no more angry. Take him home to Melville—give him good house—plenty to eat—make him well. He very sick now.'

'So, Lagoma, you are turning Christian at last, after all,' said the kind chaplain with a good-natured laugh.

A smile, the first for many years, lighted up for a moment the dark features of the chief as he replied—'Yes, now I like to get religion. I feel good here (laying his hand on his heart). Suppose you come to Melville now—I like to hear you talk.'

'Oh ho!' said the governor; 'I begin to understand the mystery. Lagoma is tired of living alone. He has been talking to his pretty cousin there, and begins to look after the parson directly. Why, Lagoma, you get on famously.'

The chief bore this attack with much good-humour, and answered, 'Me no go courting now. What for I want a wife? Governor no got any.'

This retort courteous created a laugh at the expense of that dignitary, in which he joined very heartily. 'Well, Lagoma,' said he, 'if I am unfortunate, that is no reason why you should be miserable too. So you have my permission to take your relations to your residence, on condition that you are responsible for their good treatment; and mind, I advise you to secure your wife before any of these young Mandingo gallants about Melville, with their white jackets and figured waistcoats, hear of the prize, and cut you out.'

'Very well, me see,' replied the chief coolly, as he turned to rejoin his relations. With the assistance of some of the other Eboes, old Toklah and his daughter were quickly removed to the habitation of their kinsman. There the chaplain visited them on the following day, and found that Lagoma had kept his word, by making them as comfortable as his means would admit. Part of his treasured store of money had been expended in buying clothing for them, and furniture for the hut: this he had given up to them entirely, and was now engaged in building another for himself. The dark cloud which had covered his countenance for so long a time was dispelled by the new feelings of forgiveness, goodwill, and affection which occupied his heart. He was courteous, cheerful, and earnestly desirous of conversing on the doctrines of Christianity; a subject which before he had always shunned, as if aware how much its precepts were at variance with his vindictive resolutions.

The governor was right in his anticipations. Not many months had passed before Lagoma and Nandee were married. This event, however, did not take place till after the death of the old man, who had been already reduced to extreme weakness by fever and the effects of his wound, as well as by his sufferings on board the slave ship. In this condition, the shock which he experienced on suddenly meeting the man whom he had so fearfully injured, was too much for him. He lingered for a few months, and expired in the arms of his daughter and Lagoma, but not till he had repeatedly implored, and as often been assured of, the forgiveness of the latter.

Of the Europeans mentioned in this narrative, nearly all are dead, victims to the insalubrity of these noxious climates. Lagoma and Nandee, however, are still living, and in the enjoyment of as much happiness as can reasonably be expected in this world. The patch of ground has been enlarged to a considerable farm, with fields of maize, coffee, and sugar-canes. The little cabin has become a roomy house, made vocal by the cries and mirth of several children; and Lagoma, the vindictive Eboe chief, is now not only the head man of the Melville settlement, and a useful assistant to the governor in the management of the colony, but he is also, and above all, a consistent Christian, and a catechist in the school which has been established in his village. The same energy and singleness of purpose which he displayed in the prosecution of his projects of revenge are still apparent, though directed to far different ends.

THE MARQUIS OF NORTHAMPTON'S SOIRÉE.

For several years past, it has been customary for the president of the Royal Society to invite the most distinguished Fellows of that noble institution to a series of *conversazioni*, or evening parties, which are also usually attended by a number of other distinguished men of science and letters. The president of the Royal Society, if we remember rightly, was the first to set this social example, which was promised, to be followed by the Earl of Aberdeen, as president of the Society of Antiquaries, though, for some reason, that pleasure was all anticipation. Such parties, however, are given by the presidents of the Institution of Civil Engineers, of the Institute of British Architects, and of other leading societies of the metropolis. But the Royal Society unquestionably takes the lead. The superior rank and attainments of the Fellows, and the distinguished position of the president, besides his official importance, invests these parties with extreme interest; for, in addition to the certainty of meeting there the *élite* of the scientific circles of the metropolis, you may calculate also on the presence of foreign and native distinguished personages, royal and noble. The Duke of Sussex, during his presidency, received the Fellows with great brilliancy at Kensington Palace, and never perhaps were the stately saloons of that abode of our sove-

reigns devoted to a purpose productive of higher social advantages.

The Marquis of Northampton, as the successor of the Duke of Sussex in the chair of the Royal Society, gave the first of his four receptions for the season at his own mansion on the Terrace, Piccadilly, on the evening of Saturday the 13th February. We had the good fortune to be honoured with a card of invitation, and rarely do we remember to have passed three more gratifying hours.

We reached Piccadilly about nine o'clock, and found carriages rapidly setting down company. The mansion is in every respect well appointed, although not so full of old pictures and other articles of vertu as when the late Dowager Countess of Poulett, whose property it was, entertained here the Duke of Clarence and other royal and noble visitors. The company, on reaching the hall, mostly presented their cards to a person who officiated as 'court circular,' to furnish the list of guests for the reports of the evening's proceedings. There is a fine large painting high upon the staircase wall, while a picture of Judith, with the head of Holofernes, hangs at a better height for us to estimate its excellence.

On entering the drawing-room, a master of the ceremonies quietly announced our name to the marquis, who received each visitor with a cordial shake of the hand. The suite of saloons is four in number; the first, facing Piccadilly, being the reception-room. The several apartments are decorated in that quiet, elegant style by which the older London mansions of our nobility are so happily distinguished. The architectural finishings of the ceilings, sculptured in panels and mouldings; the marble chimney-pieces in the old Italian style; in short, all the embellishments, speak of the early part of the reign of George III. The draperies, &c. and the tone of the walls, are between light-blue and French gray, best calculated for evening effect. There was no ostentatious preparation, as if for a grand 'reception' or a 'fashionable route.' On the other hand, much of the furniture and appointments had been removed, the better to accommodate large numbers; and each room was well lighted with candles, in large and brilliant lustres, with here and there lamps of classic design.

It is customary, at *réunions* like the present, to assemble models of new inventions, rare works of art, and other productions of genius, for the gratification of the company. There were few such objects at the soirée we are describing: it was the first of the four given each season, which might possibly account for the paucity. Upon the centre table, in the first room, we were much interested with some electro-metallurgic copies from antique sculpture by Mr Cox's process: the casts from a bust, and from a colossal vase, were remarkably fine: they were in copper; and the vase especially had the very *arête* of a classic age. Around these articles were placed some delicate specimens of improved photographic processes, developing some new properties of the rays of light, by M. Claudet. Upon a chair in this room was also a cabinet picture, assumed to be a Corregio, and certainly bearing the gracefulness and harmonious colouring of that master. In the next room there was little to be noticed, if we except a pair of twisted columns, the shafts of delicate mosaic, and the bases and capitals of spotless Italian marble, beautifully sculptured. These elegant archæological rarities, if we mistake not, were brought from Italy by the marquis a few years since.

We next entered the principal saloon, the most elegant as well as spacious of the suite. It was most judi-

ciously lighted by a superb central lustre, and a pair of finely-sculptured marble figures, which formed a portion of the design of the chimney-piece, of life-size, and bearing handsome branches filled with wax-lights. The general company either promenaded or collected about the tables upon which were placed the models, &c. for inspection. In the left-hand corner were some illustrative calculations, explaining why the inhabitants of our earth invariably see one face of the moon; this contribution was by Mr Perigal, but it was scarcely adapted for the occasion. Upon the next table was a copy of an exquisitely-chiselled bust of Lord Compton (son of the Marquis of Northampton), wrought out by Mr Cheverton's ingenious bust-turning machine; and facing the chimney-piece was set up one of Hutchinson's epirometers, an instrument for measuring the capacity of the lungs. It consists of a certain tubular arrangement, communicating with an index dial: the person whose lungs are to be measured blows through a caoutchouc tube; the expiration is measured by the tubes and index. This machine is much used in hospitals in testing pulmonary diseases. Its simply practical character proved as attractive on Saturday as did the first-constructed weighing-machine many years since. The company appeared especially anxious for examination; and the index, and the gentleman who attended to explain the working of the instrument, had a busy time of it. In short, there was a *personal* interest about the matter, which accounted for its attractiveness.

Opposite the epirometer was a table upon which was a beautiful specimen of the *clavagella*, a boring testaceous animal, brought from the seas washing the Philippine Islands. It was exquisitely preserved by the new process of Mr Goadby, who lucidly explained to the visitors how the little creature lodges itself in coral, and by means of its mechanical attrition, and a solvent secretion, perforates rocks or stones at great depths in the ocean. This little submarine worker has been known to naturalists but a few years.

Upon the same table with the above was a contribution by Mr Reinagle, the Royal Academician; namely, the model of a contrivance for preventing collision on railways. And here, too, was one of the newly-invented graduated dose inhalers for the administration of ether in surgical operations. In this new kind of practice, it becomes of course important to graduate the doses, as a breath too much might in its effects be not unlike a drop too much. Now, this object is accomplished by the above instrument, which continued throughout the evening to be beset by crowds of visitors. As in the epirometer, too, the personal experiment proved very popular.

We have, however, yet to notice the chief *lion* of the evening. This was a large working model of Mr Little's newly-invented and patented double-action printing machine, for working from ten thousand to twelve thousand impressions within an hour. The model (three inches to a foot) was placed within the bow of the room, and was worked incessantly by seven attendants: in the machine, the motive power will be steam; still there will be requisite a number of persons to lay on and take off the sheets. Presuming the reader to have some idea of the printing machine in general use, he will understand the vast importance of Mr Little's invention when we state that his 'double action' machine works seven out of eight cylinders, whereas the 'fast machine' works only two cylinders out of four. Here, ~~you~~ feeding-drums, cylinders, and tapes at full speed; the sheets laid on and taken off; and nothing

wanting but the inking apparatus, a settled mechanical arrangement entirely apart from the great principle of the improvement. All the principal visitors examined this working model, and must have been struck with one 'great fact' in its history—that the principle of the inventor did not undergo the least alteration from the commencement. In the construction of the model *no* experiment was necessary, and not a single wheel or motion was wasted; *the very first trial was successful*. Many thousands of sheets were passed through the model on Saturday evening, and proved satisfactory evidence of its perfection in principle and construction. The ingenious inventor and engineer of the machine were both present, and explained to the visitors its construction. Mr Hume, M.P., was one of the most active inquirers; the honourable gentleman is a Fellow of the Royal Society, but one of his remarks was strongly indicative of his legislative character; for, after acknowledging the soundness of the invention, he went to its social results in the rapid production of cheapened newspapers—a demand to be created by the further reduction of the stamp duty.

The fourth room is small and cosy, if that be not too homely a phrase for an elegant drawing-room. In the Countess of Poulett's lifetime, the walls of this apartment were covered with splendid etchings by the old masters of their own pictures. We missed these 'pearls of great price,' which were bequeathed by her ladyship to a distant branch of the family.

After our inspection of the models, we took a glance at the company. The principal rooms were at this moment studded with conversational groups of the visitors; the space between being filled up with what might be called the floating members of the assembly—those streaming through the suite of rooms in quest of new recognitions.

The meeting was graced by some four hundred visitors throughout the evening, only a portion of whom were Fellows of the Royal Society. The newspapers have reported the lists of the company by name, so that we shall merely enumerate them by classes. Thus there was a sprinkling of foreign ambassadors, and a few of our nobility, distinguished by their culture of science and patronage of its great objects. Then there were professors of natural philosophy, our leading geologists, and professors of 'natural knowledge'; several officers of the Royal Corps of Engineers, and not a few of those truly great minds—civil engineers—who are developing their genius in our gigantic railway system. Next were architects, painters, and sculptors, many of them of an inventive turn of mind, as a relief to the routine of their own professions; a few representatives of divinity, the law, and medicine; members of the legislature; some half-dozen intelligent travellers, and among them Mr Holman, the blind traveller. This last person has a very extraordinary appearance, in consequence of his allowing his beard to grow in the course of his wanderings. A tall, slender man, in black clothes, with long grayish tresses, and a streaming beard, he looks more like a native of some outlandish country than an Englishman. Wherever men of literature and science are assembled in London, there we are sure to see Mr Holman led slowly into the room. On the present occasion, though science determined the character of the meeting, literature was not forgotten. The poet, the historian, the journalist, mingled in the throng. We were also much pleased to recognise in the rooms several inventors, or 'practical men'—the working contributors to our social improvements, though rarely the full participators in their profits. It is no affectation to say, that in contemplating this great assemblage of genius and talent, we felt the geniality of an atmosphere of intellect. It was a strangely delightful thing to consider that in these rooms were collected no small proportion of those who are giving character and direction to the present age, and to whom the future must look back for a large share of such blessings as it enjoys.

Towards eleven o'clock, the arrival of Prince Albert was announced to the Marquis of Northampton, who welcomed the royal visitor in the vestibule, and thence conducted him to the principal saloon. The prince, it will be recollected, joined the Royal Society soon after his arrival in this country, and has uniformly honoured one of the presidents' annual *réunions* with his company. His Royal Highness was accompanied through the rooms by the noble host: the prince inspected the several models, and paid marked attention to that of the printing machine, the perfection of the great invention of his countryman, Koenig. There was an evident desire on the part of his Royal Highness to become acquainted with the details of the improvement. The prince is well known to be animated by a love of science, and to possess considerable knowledge of some of its branches. Although thrown into a sphere which does not seem favourable for the cultivation of such tastes, he still maintains a correspondence on scientific matters with his former preceptor, M. Quetelet of Brussels. We may therefore believe that his visit to the Royal Society soirée was not one of mere compliment or ceremony, but a gratification to himself.

Shortly before twelve o'clock the prince left the saloon, and took leave; and soon after, the general company separated.

On leaving the hospitable mansion, we could not but reflect how delightfully such pleasures as we had participated in must alternate with the severe studies of science and its kindred pursuits. The certainty of its beneficial reaction upon a well-regulated mind invests the meeting, we conceive, with much beyond conventional importance. At the same time it was a scene of elegant recreation. The liberality of the Marquis of Northampton, in extending his invitations far beyond an official circle, cannot be too highly commended as the emanation of a refined and courteous nature.

BURTON'S LIVES OF LORD LOVAT AND PRESIDENT FORBES.

THE last volume of Messrs Chapman and Hall's 'Series' is a very agreeable biographical volume, by Mr J. H. Burton, whose memoir of David Hume has already taken a respectable rank in this class of compositions. The association of heroes or subjects has been suggested by their actual association in time, place, and many transactions of life; and the accident is not an unhappy one for literary effect, for assuredly a greater contrast than that between the cunning Highland chief Lovat, and the personation of the humanity and integrity of modern statesmanship which we possess in Forbes, could not exist: it is as if the sixteenth and eighteenth centuries were brought into juxtaposition. It is rather vexing, however, to have to remark that the life of the worse man is by far the more entertaining of the two.

Lovat was a strange problem, a really able man, with immense worldly wisdom, yet wanting the power to see that there is no safety in this world without some tolerable degree of consistency and honesty. Perhaps the true key to the mystery is, that he was somewhat mad; and the fact that a son of his, who lived to our own time, was so, lends great probability to the surmise. The wonder remains, how one who had in his youth been an outlaw for the grossest crimes, who had plotted for the Stuarts, and then betrayed the plot to Queen Anne's ministry, who took arms for George I. in 1715, and sent out his clan with Prince Charles in 1745, should have ever been a receivable or presentable person in society, as he was for many years. It can only be in small part accounted for by the ready wit and glozing discourse which pertained to the chief of the Frasers.

It will sound strange that this man, whose widow died in 1796, lived in a time when the law was unable to get its behests against him fulfilled. It was in the latter years of the seventeenth century—the time when Dryden was publishing his last works—that young Simon Fraser, professing to be Master of Lovat, lived in Inverness-shire, a proscribed outlaw, in defiance of the executive. Warrants could not be executed by common officers against one who had perhaps five hundred armed Highlanders at his command in the natural fastnesses of the north. The Scottish privy council had to muster troops, garrison places of strength, and call out Lowland militia, in the effort to apprehend this audacious man. 'On the whole,' says Mr Burton, 'the force brought against him cannot have been very large; but in Simon's own history of his conflicts and escapes, the whole affair assumes the aspect of a very considerable campaign, in which his enemies, spoken of as "the several regiments of cavalry, infantry, and dragoons," are always defeated and baffled in an unaccountable manner by some handful of Frasers. He had individuals among his followers, who, like David's mighty men, performed signal acts of valour against great odds; and conspicuous among these was Alister More, a name which, being translated, means "Alexander the Great"—a name characteristic of his gigantic stature. His master says he was "the tallest man in Scotland, and not less celebrated for his brave exploits than for his prodigious height." After one of the exploits of his band, Simon luxuriates in the following grandiloquent language. "The Frasers, after this enterprise, had some respite from the encounter of large armies; but they were daily harassed with flying parties from Inverness and Inverloch, *alias* Fort-William. These were in small numbers, and the master had always timely notice of their approach, so that he gave himself little trouble about them. He might, if he pleased, have cut them in pieces wherever they appeared. But as the regular troops had always displayed a clemency for his country, and a regard for his person, he treated them with as much mildness as was consistent with the safety of his clan." He gave one of his conflicts a name to adapt it to history—the battle of Altnigoir. According to his own account, it was a complete victory; and the enemy, not only routed, but surrounded, had to sue for mercy in the most abject terms. Strangely enough, he admits that he was not inclined to grant it; that he had resolved to put to death those people who had invaded his territory and sought his life, having "no other complaint against him, than that he was born the true and legitimate heir to the estate of Lovat;" and that it was by the advice of the seniors of the clan that they were spared. But he had resolved to gratify a classic fancy on the occasion; and, "in conformity to an example he had read in the Roman history," he drew up his men on either side, and made the captives pass beneath the yoke. He did not, at the same time, neglect a ceremony more purely Celtic. Every people have their own peculiar ceremony of ratification, sometimes characteristic of their habits and temper. The Chinaman's ceremonial of an oath is the breaking of a china saucer: a practice savouring of a brittle, puny race, with little that is formidable in their nature. The Sikh is pledged on a cow's tail. The Highlander's most solemn and abiding oath was that which he took on the point of his drawn dirk. On this occasion, Simon caused the vanquished to take an oath in terms we would rather avoid repeating: they engaged never to do him the smallest mischief, directly or indirectly.'

It was, in reality, a war which Fraser conducted against the state, the object being to obtain land and titles, which the law had awarded to an heiress in preference. After all, he contrived to turn politics to account in his favour. 'We now come,' says Mr Burton, 'to some events showing the staggering and uneven pace of justice in that age, and its liability to be tugged from side to side by faction and private influence. Lovat, like a sagacious statesman, suggested

to a great western power—that of Argyle—that the House of Athole was aggrandising itself to a formidable extent; that it was necessary, for the preservation of the old way of the House of Argyle, that this rival should be checked and humbled; and finally, that if the Marquis of Tullibardine were to mediatise the secondary power of the Frasers, and bring them under his own subjugation, as he intended to do, the balance of power in the Highlands would be seriously shaken. On this Argyle exerted himself to procure a pardon, a circumstance which is attested by other evidence than Lovat's own. At Argyle's recommendation he took a journey to London, with the secrecy necessary to one who had sentence of death hanging over his head. King William was then on the continent, whither Lovat passed over, and had address enough to pay two visits, with equal encouragement—the one to the exiled court at St Germain's, the other to King William at Loo. He says he got the latter to append the sign-manual to an ample and complete pardon for "every imaginable crime."

It is but a proper pendant to these sketches of Scotland a century and a half in the rearward, to give Mr Burton's account of the convivialities in which the gentlemen of that age indulged. He is telling us of Forbes's position, as brother of the Laird of Culloden in Inverness-shire, and a rising young lawyer. 'Let us now take a general glance at the social habits of Duncan Forbes in early life. Among them conviviality occupied a far more prominent place than social moralists of the present day would consider compatible with the decorum of a high official person, professing serious religious opinions. Not few are the indications throughout his correspondence of the influence of wine: indeed he seems, in his novitiate, before he became a crown lawyer, to have been a prime ringleader among jolly fellows.

'The demands, indeed, which society then made on a man who had a head capable both of standing claret and entertaining company, were very formidable; and if he was rising in the world, gaining golden opinions among men, and showing his aptitude for high stations, he had to drink all the larger draughts of wine, to show that he was not deficient in that main element of public greatness. Drinking through a session with his lawyer brethren in Edinburgh would be no light task. When he went north, he would have to recommence convivialities, to keep up the family influence among the Highland chiefs and the barons of Moray; and as the northern air has the reputation of counteracting the effects of intoxicating draughts, the potatoes of Edinburgh would have to be balanced by wider and deeper libations at Inverness. That his constitution sometimes felt the pressure of these laborious enjoyments, we find from such occasional passages as the following, from a letter dated Inverness, 26th of September 1716, and addressed apparently to one of his jovial friends in Edinburgh:—"For my own part I am almost wearied of this wicked world; one wish, and but one, I had when I left you concerning myself—that I might enjoy eight days free of company and claret. How I have succeeded, you may guess by this, that though to-day it be just a month since I saw you, I have not yet buckled a shoe; that is, I have not been one day out of my boots."

'When in the north, he would have to do duty side by side with his brother the laird, whose feats in this department of human exertion were so distinguished even in that age, that he was honoured with the name of Bumper John, to distinguish him from all other lairds of Culloden. Of the method of life at the Old Castle, we shall let Bart, brought up under the somewhat milder conviviality of English military life, speak: "There lives in our neighbourhood, at a house (or castle) called Culloden, a gentleman whose hospitality is almost without bounds. It is the custom of that house, at the first visit or introduction, to take up your freedom by cracking his nut (as he terms it); that is, a cocoa-shell, which holds a pint, filled with champagne,

or such other sort of wine as you shall choose: you may guess by the introduction at the contents of the volume. Few go away sober at any time; and for the greatest part of his guests, in the conclusion they cannot go at all.

"This he partly brings about by artfully proposing, after the public healths (which always imply bumpers), such private ones as he knows will pique the interest or inclinations of each particular person in the company, whose turn it is to take the lead, to begin it in a brimmer; and he himself being always cheerful, and sometimes saying good things, his guests soon lose their guard, and then—I need say no more.

"For my own part, I stipulated with him, upon the first acquaintance, for the liberty of retiring when I thought convenient; and, as perseverance was made a point of honour, that I might do it without reproach.

"As the company are disabled one after another, two servants, who are all the while in waiting, take up the invalids with short poles in their chairs, as they sit (if not fallen down), and carry them to their beds, and still the hero holds out.

"I remember one evening an English officer, who has a good deal of humour, feigned himself drunk, and acted his part so naturally, that it was difficult to distinguish it from reality; upon which the servants were preparing to take him up and carry him off. He let them alone till they had fixed the machine, and then raising himself up on his feet, made them a sneering bow, and told them he believed there was no occasion for their assistance; whereupon one of them, with a *sang-froid* and a serious air, said, 'No matter, sir; we shall have you by and by.' This laird keeps a plentiful table, and excellent wines of various sorts, and in great quantities; as indeed he ought, for I have often said I thought there was as much wine spilt in his hall as would content a moderate family."

'The types of true hospitality in a Scottish farmer's house of old, were said to be an anker of whisky always on the spigot, a boiler with perpetual hot water, and a cask of sugar with a spade in it. Culloden's hospitalities were of a more aristocratic order, and the custom of the house was to prize off the top of each successive cask of claret, and place it in the corner of the hall, to be emptied in pailfuls. The massive hall table which bore so many carouses is still preserved as a venerated relic, and the deep saturation it has received from old libations of claret, prevents one from distinguishing the description of wood of which it was constructed. When Duncan was in the north, he appears generally to have lived at Bunchrew, and besides his participation in the jovialities of Culloden, he had occasional hospitalities to distribute in a peculiar circle of his own. Examining an old account, one of many which lie among more valuable papers, the items of several charges for claret bought in individual dozens, some at 16s., and some at 18s., show a sum of £40 spent in this manner in the course of a month.*

'In estimating the character of any man, we must measure it by the habits of his age. Temperance was not one of the virtues of that period. It was not associated with particular moral or religious opinions; and the younger John Forbes, who inherited the serious principles of his family, we find not ashamed, in writing to Sir Andrew Mitchell, to make in all seriousness such an association of ideas as the following:—"God Almighty bless the king of Prussia, and you. We pray for you, and drink for you both every day!" A man who eschewed claret was looked upon as merely exceptional; the victim of some peculiarity, mental or physical; and the idea of investing his conduct with any merit would have been considered transcendently ludicrous. Temperance was not a quality to which Forbes aspired, and in this respect he was neither before nor

* We beg to draw attention to these memorials of intemperance in a past age. We are continually hearing lamentations on the vast increase of drunkenness; whereas nothing is more historically true than that this, like some other odious vices, has greatly decreased within the recollection of persons now living.—Ed.

behind the principles of his age. From the Scottish convivialities of the last century even the female sex was not entirely exempt; and though perhaps there is no part of the world where women of the educated classes are now more completely exempt from a practice which modern ideas have stamped as degrading, there are not wanting reasons for believing that ladies of good birth and rearing, in the earlier part of last century, quaffed potations which would make their fair descendants shudder, without either losing caste or character, or exposing themselves to the contumely that overtook poor Lady Grange. It was particularly remembered, not many years ago, by old people in Edinburgh, that a band of damsels connected with a great northern house, walking clamorously up the High Street in a beautiful moonlight night, stopped suddenly where the shadow of the Tron Church steeple crossed the street, and, under the hallucination that they had reached the edge of one of their mountain streams, were observed to divest themselves of their shoes and stockings to wade across.

The many traditions we have of the joviality of our forefathers are accompanied by statements of the wonderful feats of intellect performed by public men, lay and clerical, when to all ordinary observation the faculties were irretrievably steeped in claret; and these lead to the remark, that we will not get a right appreciation of the character of previous generations by passing a sweeping condemnation on them for practices so much at variance with those of the same class at this day. In some way or other, nature, ever wonderful in the adjustment of things apparently incompatible, seems to have adapted the men and their hereditary constitutions to the life they led. They performed their part on the world's stage, and left vestiges in which the unsteady pace of intoxication is seldom to be traced. Without the fruit of their labours, the present generation would not be such as it is; and in the statesman or lawyer of a century ago, who, after his deep potations, carried a frame and intellect as fresh and vigorous as ever to his important labours, we find no prototype of the attenuated and trembling dram-drinker of the present day, whose unstrung nerves require a violent forestalment of their wasting stamina for each act of ordinary exertion, and for every occasion on which he has to hold intercourse with his fellow-men as a member of society.

Yet however it may have stood with country gentlemen, breathing the fresh air all day, with no anxieties except about their mortgages, the system was sometimes considered oppressive even by these herculean men of business. "I haven't yet seen Culloden; but he and I will mind your honour in a glass, deep proportioned to your wealth, and sprightly as your wisdom," is the convivial wish that in a moment of easy gaiety arises in Duncan's official superior, the lord advocate; but after a toilsome convivial journey, we find the great law officer of the crown thus hazily giving utterance to his oppressive reminiscences:—

"The good people of Inverness and Moray were so exceedingly kind (if it can be called kindness to make a man run the gauntlet), that neither shame nor remorse had any effect upon me; and seriously, though I thought myself happy that neither your brother John nor the squire were in the country, yet everybody, I don't know how, took upon them to be Johns and squires to me; and for ought I know, I might have been cracking nuts till now, if I had been able. The fire about Aberdeen was not so intense; but, comparatively speaking, it was pretty smart. The Perth people are good enough for a brush, and away; but the pleasures of the enchanted island, the ball, the Lucy Barbers, and the strange and surprising adventures of Emperor Gausy, must be left to another tune."

Duncan himself, in the full tide of his onerous labours, feeling his health precarious, sacrificed his conviviality to his duties; no small stake of character in that age.

In collecting his facts, Mr Burton has shown an industry considerably superior to what is generally found in publications of this kind. He states them lucidly, and his remarks are invariably of an enlightened character. On the whole, we can recommend the book very confidently to the public.

AMERICAN WHALERS.

In the year 1841, Mr J. Ross Browne, a young Kentuckian, left his home to push his fortune in the world. After passing some time at Washington, the seat of the United States government, in an attempt to obtain a situation as reporter in the Houses of Congress, he started for New York with an acquaintance as thoughtless and enterprising as himself, where they signed articles for a whaling voyage, and sailed from New Bedford, the principal port for vessels engaged in the whale-fishery. The hardships of a sea-life, and the reckless cruelty of the captain, soon dissipated all the feeling of romance under which the adventurers had embarked: one of them was attacked by madness while in the warm latitudes, in consequence of a sun-stroke. The tyranny, suffering, and privation endured in these tedious cruises, extending sometimes to two or three years, have found a chronicler in Mr Browne, who, with that ready talent which seems to be a characteristic of his countrymen, has written a volume comprising the principal events and proceedings on a whaling voyage.*

The active and enterprising commercial spirit of the Americans has led them to compete successfully with the parent country in the whale-fishery. It is but little more than half a century ago that the first expedition to the South Seas was fitted out by an Englishman; the result was so satisfactory, that from that period the various latitudes of the broad Pacific have gradually become the scenes of a valuable and increasing trade, for which an active competition was carried on between America and England during a number of years. The government of this country, with a view of promoting this branch of commercial enterprise, paid bounties to the most successful ships, varying from L.300 to L.700. In the year 1820, when 210 vessels were employed in the whale-fishery, L.53,850 were paid as bounties. Notwithstanding these inducements, the British trade has declined, while that of the United States has proportionately increased. According to a writer in the 'Democratic Review,' the fleet of the latter country now numbers '650 ships of 200,000 tons, and manned by some 17,000 to 18,000 American seamen. The value of the vessels and outfit is estimated at 25,000,000 dollars, and they produce annually 5,000,000+ dollars' worth of oil and bone.' All history proves the utter uselessness of attempts to force a trade; and as our government has recently abandoned all duties on foreign oil, it will doubtless be cheaper for England to purchase the article from the Americans than to go and fetch it from the Pacific Ocean.

The work under notice contains some spirited narrative of life in the whaling latitudes, and of the operations by which the oil is extracted from the carcasses of the captured whales. The duties appear, for the most part, to be dangerous and disagreeable; yet a certain spirit of adventure seems to reconcile the crews to their mode of life. When a vessel arrives at her station, a sharp look-out is kept up for the fish, which are seen from a great distance by their 'spouting,' or throwing up a column of water from their nostrils. On such occasions something like the following colloquy ensues:—'There she blows!' was sung out from the mast-head.

'Where away?' demanded the captain.

* Etchings of a Whaling Cruise; with Notes of a Sojourn on the Island of Zanzibar. To which is appended a brief History of the Whale-Fishery, &c. &c. By J. Ross Browne. New York. 1846.

† One-fifth of the above sums represents their value in pounds sterling.

'Three points off the lee-bow, sir.'

'Raise up your wheel. Steady!'

'Steady, sir!'

'Mast-head, ahoy! Do you see that whale now?'

'Ay, ay, sir! a school of sperm whales! There she blows! there she breaches!'

'How far off?'

'Two miles and a half.'

'Thunder and lightning! So near! Call all hands! Clew up the fore-t'-gallant-sail. There! Belay! Hard down your wheel! Haul aback the mainyard! Get your tubs in your boats! Bear a hand! Clear your falls! Stand by all to lower! All ready?'

After this multiplicity of queries and orders, three boats were lowered and manned by their crews, who bent every muscle in the rivalry of the chase. Just, however, as the headmost boat had reached the whale, the animal suddenly plunged, and rose again at the distance of a mile. A black cloud, brewing a heavy squall, was fast rising to windward; but the boat kept on, and had made a prize of the fish, when, writes Mr Browne, 'suddenly a white streak of foam appeared within a hundred yards. Scarcely had we unshipped our oars, than the squall burst upon us with stunning violence. It is utterly impossible to conceive the violence of the wind. Small as the surface exposed to the squall was, we flew through the foaming seas, dragging the dead body of the whale after us, with incredible velocity. Thus situated, entirely at the mercy of the wind and sea, we continued every moment to increase our distance from the bark. When the squall abated, we came to under the lee of the whale, and looked to leeward for the bark. Not a speck could be seen on the horizon! Night was rapidly approaching, and we were alone upon the broad, angry ocean!' However, after a weary pull for two or three hours, the ship was seen, and at night-fall the tired boat's crew found themselves once more on board, with the whale securely lashed to the vessel's side.

This latter operation affords scope for the exercise of a little seaman-like dexterity:—'When the whale has been towed alongside by the boats, it is firmly secured by a large rope, attached to the "small" by a running noose. There is not a little ingenuity in the manner in which the fluke-rope is first passed under the body of the whale. A small line, to which a lead is fastened, with a block of wood at the extremity, several fathoms from the lead, is thrown over between the whale and the ship's side. From the impetus given to the lead, it sinks in a diagonal direction, drawing the block down after it. One end of the lead-line is fastened to the fluke-rope on board, and the block attached to the other rises at the off-side of the whale. It is then hauled on board by means of a wire-hook fastened to a long pole.' This, it will be understood, at once gives the means for lashing the carcass to the side of the vessel, which is always done with the head towards the latter's stern; and the operation of cutting up is then commenced.

'The cutting-tackle,' continues Mr Browne, 'is attached to a powerful strap, or pendant, passing round the mast, in the maintop, by two large blocks. There are, in fact, two tackles, the falls of which pass round the windlass. To each of these tackles is attached a large blubber-hook, which, upon being made fast to the blubber, are hauled up by the windlass, one only being in operation at a time. . . . The blanket-pieces (as the strips of blubber are called) are stripped off in a spiral direction, running down towards the flukes: the whale turning at every heave of the windlass, till the whole covering of blubber is stripped off to the flukes, which are hoisted on board, and those parts containing oil cut away, and the remainder thrown overboard. The head having in the first place been cut off and secured to the stern, is now hauled up, with the nose down, if too large to be taken on board, and hoisted so far out of the water as may be found convenient, and the oil, or liquid spermaceti, baled out with a vessel attached to a long pole, and thus taken in and saved. As there is no

little risk attending this mode of getting the spermaceti, and a great deal of waste, the head is always taken on board, when not too large or heavy.

'The "case," which is the name given by whalers to the head, sometimes contains from ten to fifteen barrels of oil and spermaceti. A single "blanket-piece" not unfrequently weighs a ton, or upward. In hauling it up by the tackles, it careens the vessel over frequently to an angle of fifteen or twenty degrees, owing to its own great weight, combined with that of the whale, the upper surface of which it raises several feet out of the water. . . . It is afterwards dropped down into the hold or blubber-room, where it is cut up into blocks of a foot and a half or two feet in length, and eight or ten inches in width. These blocks are called "horse-pieces." The white, hard blocks, containing but little oil, and which are found near the "small," and at the flukes, are called "white-horse." The carcass of the whale, when stripped of its blubber, is cast loose, and soon sinks from the want of its buoyant covering.'

When the blubber is lowered into the hold, it is cut up into smaller pieces with sharp spades, in readiness for the 'mincers,' who cut it into thin slices for the try-pot or copper. After the first cask of oil has been obtained, the fire is kept up with the dried pieces of blubber. According to Mr Browne, this is the most disagreeable part of the business. 'The try-works,' he writes, 'are usually situated between the foremast and the main-hatch. In small vessels, they contain two or three large pots, imbedded in brick. A few barrels of oil from the whale's case, or head, are baled into the pots before commencing upon the blubber. Two men are standing by the mincing-horse, one slicing up the blubber, and the other passing horse-pieces from a tub, into which they are thrown by a third hand, who receives them from the hold. One of the boat-steerers stands in front of the lee-pot, pitching the minced blubber into the pots with a fork. Another is stirring up the oil, and throwing the scraps into a wooden strainer. We will now imagine the works in full operation at night. Dense clouds of lurid smoke are curling up to the tops, shrouding the rigging from the view. The oil is hissing in the try-pots. Half-a-dozen of the crew are sitting on the windlass, their rough, weather-beaten faces shining in the red glare of the fires, all clothed in greasy duck, and forming about as savage a looking group as ever was sketched by the pencil of Salvator Rosa. The cooper and one of the mates are raking up the fires with long bars of wood or iron. The decks, bulwark, railing, try-works, and windlass, are covered with oil and slime of black skin, glistening with the red glare from the fires. Slowly and doggedly the vessel is pitching her way through the rough seas, looking as if enveloped in flame.

"More horse-pieces!" cries the mincer's attendant.

"Horse-pieces!" echoes the man in the waist.

"Scraps!" growls a boat-steerer.

'By and by the captain, comes up from the cabin to see how things are progressing. He peeps into the pots, and observes in a discontented tone, "Why don't you keep that 'ere oil stirred? It's all getting black." Then he takes a look into the mincer's tub. "That won't do. Make bible leaves of 'em!" Then he looks at the men on the windlass. "Hey! all idle! Give these fellows something to do. We can't have idlers about now."

The captain, however, soon disappears, and the men enjoy themselves in the usual sailor manner, by singing songs or telling stories. 'About the middle of the watch they get up the bread-kid, and after dipping a few biscuits in salt-water, heave them into a strainer, and boil them in the oil. It is difficult to form any idea of the luxury of this delicious mode of cooking on a long night-watch. Sometimes, when on friendly terms with the steward, they make fritters of the brains of the whale, mixed with flour, and cook them in the oil. These are considered a most sumptuous delicacy. Certain portions of the whale's flesh are also eaten with

relish, though, to my thinking, not a very great luxury, being coarse and strong. Mixed with potatoes, however, like "porpoise balls," they answer very well for variety. A good appetite makes almost any kind of food palatable. I have eaten whale-flesh at sea with as much relish as I ever ate roast-beef ashore. A trying-out scene has something peculiarly wild and savage in it—a kind of indescribable uncouthness, which renders it difficult to describe with anything like accuracy. There is a murderous appearance about the blood-stained decks, and the huge masses of flesh and blubber lying here and there, and a ferocity in the looks of the men, heightened by the red, fierce glare of the fires, which inspire in the mind of the novice feelings of mingled disgust and awe. But one soon becomes accustomed to such scenes, and regards them with the indifference of a veteran in the field of battle. I know of nothing to which this part of the whaling business can be more appropriately compared than to Dante's pictures of the infernal regions. It requires but little stretch of the imagination to suppose the smoke, the hissing boilers, the savage-looking crew, and the waves of flame that burst now and then from the flues of the furnace, part of the paraphernalia of a scene in the lower regions.

The book from which the foregoing passages are taken, affords another instance of the adventurous spirit prevalent among the inhabitants of the United States. Such instances are not rare in American literature. Mr Browne's work will not be the least valuable if he should succeed in causing some restraint to be placed on the unbridled tyranny of the whaling captains, of which his volume contains several examples. Many lives are annually sacrificed, and many a brave fellow's spirit crushed for ever, from this cause alone. There is no class of whale-men, as in this country; and many young men are inveigled into the service under delusive promises, who, at the expiry of their three years' cruise, find themselves penniless from the rapacious knavery which has beset them at their outfit, and during the whole voyage. It is to be hoped that the American authorities, for their own sakes, will no longer neglect a class on whose industry so great a portion of their commerce depends.

PUTTING OUT THE AURORA.

ANY one who has lived long in London, and who has paid ordinary attention to the passing occurrences of the hour, must have been startled more than once by the cry of 'Fire!' and the almost simultaneous rattle and rumble of the engines consequent upon it. We have often, during our residence in the great capital, left our books and our comfortable chimney corner to observe not merely the fire, and the sublime spectacle which a large one invariably offers, but the behaviour of the crowd, and to listen to the conversation of those whose curiosity was excited. Upon one occasion, in particular, we felt more than ordinary interest in the cry. We heard 'Fire!—fire!' shouted by numerous voices; and turning out into the street in a cold night of December, saw the people gathering at their doors, or looking out of their windows, and the ragged urchins, that always swarm in great cities, rushing towards the supposed scene of the conflagration. The sky was red as with fire. Each man asked his neighbour where the mischief was. 'It is at Blackheath,' said one: 'it must be there, or at Lee, or Lewisham, or Bromley—the glow is clearly in that direction.' 'Perhaps it is at Greenwich,' said a second. 'It is undoubtedly in the vicinity of Greenwich,' chimed in a third. 'It is very awful,' said a fourth. 'There go a lot of boys after the engines,' said a fifth; 'they can tell us where the fire is.' A boy being seized hold of by the last speaker, he was asked where the engines were going to. 'Down the Kent road somewhere,' said he; 'the flames are in that direction.' And all the crowd looked, and so they were. Engine rattled after engine, followed at short intervals

by rapid pedestrians of all ages, but chiefly by young men and women, eager to see the sight. Hundreds and thousands of people were astir in every quarter of the metropolis, many of them expressing the regret so common to the Londoners, that the conflagration was not in the immediate vicinity, that they might enjoy the excitement and the luxury of looking at it; and, to do them justice, the still greater luxury and excitement of aiding to put it out. All the night long the firemen were on the alert, buckling on their helmets, preparing their 'hose,' and driving, as on an errand of life or death, through the stony highways of the capital. All the night long, however, there was a most provoking indistinctness of intelligence as to the precise locality of the enemy which they were to combat. Meantime the sky grew redder and redder, as if suffused with the hazy glow of a burning city forty miles off, and not with the reflection of any smaller conflagration at a nearer distance. Spiral shoots, as of immense volumes of sparks, were projected on the azure forehead of the sky; and at each deepening of the colour a shudder ran through the multitude, and women whispered to women their earnest hopes that no human creatures, no mothers and young children, were at these moments perishing in the flames. Sometimes the reflection grew fainter, and then a hope spread through the multitude that the worst was over, that the danger was past, that the fire had burned itself out, or that the engines had successfully battled with the destroyer. Ultimately the reflection grew paler and paler still, and flickered away to nothing. The people retired to their beds, and consoled themselves with the idea that they should know all the particulars of the fearful damage, and slake their 'burning' curiosity, in the newspapers of the next morning.

The newspapers of the next morning did not, however, afford the information desired. They had no accounts in large letters, or any letters, of the conflagration; and either those ready purveyors of intelligence were for once in arrear with a matter of public notoriety, or would announce it in the course of the morning, and give it all the importance desirable from a second or third edition; or there had been a mistake altogether, and the supposed fire was no fire at all. The latter supposition ultimately proved to be the correct one. The people had been deceived. The reflection in the sky proceeded from a brilliant aurora borealis. The firemen had had their labour in vain, and had returned home long ere morning with the full conviction of the delusion of which they had been the victims.

The incident reminded us that men in all ages had made similar mistakes in the moral world, and that this street occurrence might stand as a type and symbol of the oft-repeated efforts of ignorant men to destroy a glory which they did not understand—to quench the light of heaven upon the apprehension that it proceeded from a fire of the earth, and was of the earth, earthy; and to wage a finite war with the splendours of the Infinity. A great fireman of this class was 'Melitus, the son of Melitus, of the borough of Pitthos.' He declared upon oath to the people of Athens that 'Socrates, son of Sophroniscus, of the borough of Alopecus, was guilty of not believing in the gods which the state believed in, and of introducing other new divinities; that he was guilty, moreover, of corrupting the young, and demanded against him the penalty of death.' The people of Athens believed that this fire of heaven in the soul of Socrates was a mortal and earthly fire that would damage their city. They listened, therefore, to the cry of 'Melitus, the son of Melitus, of the borough of Pitthos'; they extinguished the life-light in the frail tenement of an old man's body, and found, when they had done so, that there was an aurora still shining—an aurora of truth, which their puny efforts could not extinguish from heaven or from earth. They, like the Londoners, had attempted 'to put out the aurora.'

When the Jews and the Romans, in the early ages

of Christianity, and the Inquisition at a later period, sought by the cross, the rack, the stake, the boiling caldron, the thumb-screw, and the gibbet, to destroy Christianity in the persons of its most illustrious teachers, they made the same mistake. They imagined the light of heaven to be an incendiary fire; they strove to direct their powers of extinction against it: they brought out their terrible engines, they traversed the earth in search of the spreading flames, that they might annihilate them. All in vain. The glow was a glow in the Infinitude; the glory was from above, and all their efforts were unable to obscure it. *They could not quench the aurora.*

One more instance will suffice. Friar Bacon, the greatest scholar of his age and nation, was too wise for his time. His light shone too brilliantly before men. It was thought to be the light of hell, and not of heaven—a fire to be extinguished with as much promptitude as possible, for the safety of the people. He was put into prison for being wise. He was cut off from his friends, his studies, his books, and subjected to such cruel privations, that he was often on the point of perishing with hunger. He procured his liberty by chance, enjoyed it for a few years, and was again, at the age of sixty-four, put into a dungeon, where he remained for ten years. They could not extinguish his light, however. It shines even yet. *They could not put out the aurora.*

There is no necessity for citing the stories of Galileo, Harvey, Jenner, and scores of others equally appropriate. In all these cases the light was an alien light to the people. They saw it shining; but not understanding it, they thought it could not be good; and not being good, that they were called upon to aid in the work of its extinction. But in each case it was too heavenly for them—it was beyond the reach of their water-pipes; and the ignorant 'brigades' bestowed their trouble in vain, in consequence of not being able to distinguish the difference between a chimney on fire and the splendours of the aurora.

The same causes are still in operation. Let us take care that by no fault of ours we run on any such foolish errands. If we see a great light upon the horizon, do not let us hastily conclude that because it has recently appeared—because it was not there when we last looked—because we do not understand it—that it must of necessity be a light of mischief—the reflection of a conflagration—the result of incendiarism—a thing born of evil, and spreading evil—or that we are called upon, as good citizens, to aid in its extinction. Let us be convinced, before we move in the matter, that it is not an aurora, and thereby save our zeal for the more profitable occasion when there may be a real fire in our own street; and when our own house, or that of our neighbour, may be in danger of destruction.

THE RATS OF THE CHÂTELET.

TILL the period of the Revolution, Paris possessed an ancient prison, more like a fortress than a jail, called the Grand Châtelet. This old structure was situated on one of the quays facing the Rue St Denis, and was of imposing height and appearance. In the course of the terrible doings of 1793, the Châtelet ceased to be used as a prison, and was partly demolished. The remainder, as national property, was sold to a private individual, in whose hands it remained till 1813, when the whole was cleared away to enlarge the adjoining square.

On taking possession of the edifice, the private proprietor just mentioned found that he was by no means to be the sole tenant of the building. The dungeons, vaults, and many passages above and below the ground were discovered to be in possession of rats, to an extent beyond all power of calculation. In vain had the access to the lower caverns been built up, and other means adopted to free the upper apartments from the intrusion of these visitors: the family, on taking pos-

session, beheld, to their dismay, whole legions of rats pouring in upon them. Regardless of everything, and impelled by hunger, they filled the rooms, overran the beds and other furniture, and scampered about with unconcern along the passages, and up and down the stairs.

M. Dulaure, the new proprietor, did not suffer this invasion without attempting a repulse. His first plan was to buy a great number of cats, and these were let loose on the foe. A short experience proved the futility of the effort. The cats devoured what they killed, and therefore destroyed no more rats than they could eat. Besides, after a few days, the cats became disgusted with the occupation. They had eaten so many rats, that all relish for them was gone. Occasionally they would still attack a few stragglers, but the rats defended themselves so vigorously, that the cats were almost always vanquished.

As the war of attack ceased, the rats assumed their wonted confidence. Discovering, by experience, that the best times for visiting the family were during meals, they made their appearance regularly every day at breakfast and dinner, when, sitting down quietly near the table, they would wait patiently for some crumbs, seemingly expecting them as a right, which they took the trouble to pick up. Unable to repel these disagreeable guests, both masters and servants, tired of the continual warfare, came to the determination of setting apart the rats' share. Thus a quantity of scraps was abandoned to them each day, and, strange to say, their depredations became less frequent; but, doubtless wishing to thank their entertainers for this kind proceeding, they appeared in greater numbers than ever at the usual hours: some of the more youthful led the old gray-headed rats with all the assurance of intimate acquaintances introducing their friends.

One of their number, nearly white with age, always walked slowly and heavily, taking care to pass as near as it could to a large cat, which was obliged to be content with raising its back and sputtering, without daring to attack the offender. This rat was of an extraordinary size: the poor cat was, however, no coward, as was easily perceived from its being minus an ear, and having a dreadfully scarred face; but poor Tom recognised such a dreadful adversary in this old patriarch, that he was willing enough to abuse him, but ventured no further.

The inhabitants of the Châtelet gave this rat the name of Gaspard, and he soon became familiar with this appellation, always turning to look in the direction from whence he was called. M. Dulaure, having seen Gaspard several times, gave him the name of the 'Nestor of the Tribe.'

Whenever one attempted to chase these strange visitors, it was always remarked that Gaspard retreated as slowly as ever—though he could have trotted much faster, if he had chosen so to do—and that his companions never lost sight of him, appearing always ready to defend and protect him if necessary.

It was soon found to be perfectly useless to wage war against the rats, the vast numbers setting all available powers of destruction at defiance: their agility, as well as the danger of their bites, had completely discouraged the servants. Poison and traps obtained no better success than cats; and so great was their instinct, that they learned to detect poison, and turned away from the traps. The cats having learned wisdom by experience, attempted nought but a war of ambuscade, that was neither frequent nor successful enough to be of great service, and in which they often proved themselves less knowing than their adversaries. To an Englishman, it will appear somewhat remarkable that a few terrier dogs were not tried as an engine of extirpation. Such a dog as the famed *Billy*, for example, would probably have cleared the house in a week; but the French do not appear to possess this useful variety of the canine species, or at all events it was not thought of on the present occasion.

It would be amusing to detail all the plans abortively attempted to quell the rats. At one time the inhabitants of the Châtelet succeeded in enticing a number of them into a room where several trains of sulphur and powder had been previously laid: this met with some success; but those who escaped having retained the memory of the smell, it was quite impossible to allure them a second time. They, however, had dreadful battles in the vaults amongst themselves, and when a victory was won, or a suspension of arms took place, the survivors regaled themselves on the dead and dying, by which means the nation was no doubt relieved in times of scarcity. Truly, if a method could have been found of breathing discord amongst them, in order to raise civil war, it would have been the most efficacious means of destroying them.

It was long ere the poor servant-maids could get over the terror they felt at the constant apparition of these animals: they were to be seen everywhere, even creeping up on the skirts of the women and children, but running off at the slightest scream, never attempting to bite, if not retained, of which there was little danger. They evidently liked warmth, as they would lie down quietly under the blankets, on the beds, and even beside the sleepers; but as they were not famished, the only harm they did was to cause alarm and disgust.

The final demolition of the Grand Châtelet at once dispersed this extraordinary colony of rats. Turned out of their ancient homes, they fled to the surrounding streets, and endeavoured to find a lodgment in the houses. The inhabitants, however, were on their guard, and many were killed. There was something almost melancholy in the fate of these poor creatures. Shut out from human habitations, great bands of them wandered about like emigrants seeking a settlement, and were fain to take refuge on the banks of the Seine, and in the common sewers of the city. Little by little they disappeared; and it is believed that many found refuge and food in some large grocery stores at the corner of the Rue St Denis; with what satisfaction to the owners, we are unable to say.

THE JEWISH CHARACTER.

It is the fashion in this country to decry the Jews—to represent them as invariably sordid, mercenary, avaricious, and griping—indeed to carry the charges laid against them to such a length, as to associate with their names a spirit of usury amounting to the most flagrant and dishonourable extortion. And these charges have been repeated so often, and echoed seriously by so many persons deemed a respectable authority, that the prejudice against the Jews has become interwoven with the Englishman's creed. But the exceptions have been mistaken for the rule; and, strange as the assertion may sound to many ears, we boldly proclaim that there is not a more honest, intelligent, humane, and hospitable class of persons on the face of the earth than the Jews. The fact is, when an Englishman is broken down in fortune, and can no longer raise funds by mortgage on his estate, nor by the credit of his name, he flies to the money-lender. Now, Jews are essentially a financial nation; and money-broking, in all its details, is their special avocation. The class of Israelite money-lenders is, therefore, numerous; and it is ten to one that the broken-down individual who requires a loan addresses himself to a Jew, even if he take the money-lender living nearest to him, or to whom he is first recommended. Well, he transacts his business with this Jew; and as he can give no security beyond his bond or his bill, and as his spendthrift habits are notorious, he cannot of course obtain the loan he seeks, save on terms proportionate to the risk incurred by the lender. Yet he goes away, and denounces the Jew as a usurer. But does this person reflect that, had he applied to a Christian money-broker, the terms would have been equally high, seeing that he had no real security to offer, and that his name was already tarnished? Talk of the usury of the Jews—look at the usury practised by Christians! Look at the rapacity of Christian attorneys!—look at the greediness of Christian bill-discounters!—look, in a word, at the money-making spirit of the Christian, and then call the Jew the usurer

par excellence! It is a detestable calumny, a vile prejudice, as dishonourable to the English character, as it is unjust towards a generous-hearted race!—*Mysteries of London.* [We cordially agree in this manly defence of a cruelly-misrepresented people.]

HOPE.

THE future is man's immemorial hymn:

In vain runs the present a-wasting;
To a golden goal in the distance dim
In life, in death, he is hastening.
The world grows old, and young, and old,
But the ancient story still bears to be told.

Hope smiles on the boy from the hour of his birth;

To the youth it gives bliss without limit;
It gleams for old age as a star on earth,
And the darkness of death cannot dim it
Its rays will gild even fathomless gloom,
When the pilgrim of life lies down in the tomb.

Never deem it a Shilboleth phrase of the crowd,

Never call it the dream of a rhymer;
The instinct of nature proclaims it aloud—

WE ARE DESTINED FOR SOMETHING SUBLIMER.

This truth, which the witness within reveals,
The purest worshipper deepest feels.

—Schiller.

J. C. MANGAN.

NOVEL USE OF EGGS.

In some parts—for example, in the province of Janu—hens' eggs are circulated as small coins, forty-eight or fifty being counted for a dollar. In the market-places and in the shops, the Indians make most of their purchases with this brittle sort of money: one will give two or three eggs for brandy, another for indigo, and a third for cigars. These eggs are packed in boxes by the shopkeepers, and sent to Lima. From Janu alone several thousand loads of eggs are annually forwarded to the capital.—*Tokodi's Travels in Peru.*

THE BANE OF THE TOWN THE BOON OF THE COUNTRY.

The very refuse of the materials which have served as food and clothing to the inhabitants of the crowded city, and which, if allowed to accumulate there, invariably and inevitably taint the air, and render it pestilential, promptly removed and spread out on the surface of the surrounding country, not only give it healthfulness, but clothe it with verdure, and endue it with inexhaustible fertility.—*Dr Southwood Smith's Evidence before the Health of Towns' Commission.*

CHAMBERS'S EDUCATIONAL COURSE.

A WORK for some time in considerable request has now been added to the EDUCATIONAL COURSE—'ARITHMETIC, THEORETICAL AND PRACTICAL,' which, while serving as a sequel to the 'Introduction to Arithmetic,' formerly published, forms an independent treatise, conducting the pupil from the first steps in the science of numbers to that stage where it becomes necessary to adopt the more general symbols of Algebra.

By the addition of this work, the series of books in the EDUCATIONAL COURSE on the science of Number and Measurement (Mathematics) may be said to be complete. The list is as follows:—

- Introduction to Arithmetic. Price 1s.
- Arithmetic, advanced treatise, now issued. Price 2s. 6d.
- The Elements of Algebra, in two Parts, each 2s. 6d.
- A Key to the Elements of Algebra. Price 2s. 6d.
- Plane Geometry, or Simon and Playfair's Euclid extended and improved. Price 2s. 6d.
- A Key to Plane Geometry. Price 2s.
- Solid and Spherical Geometry. Price 2s. 6d.
- Practical Mathematics, two Parts, each 4s.
- Mathematical Tables. Price 3s. 6d.

W. and R. CHAMBERS, Edinburgh, and all Booksellers.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 28 Miller Street, Glasgow; W. B. Orr, 147 Strand, and Amen Corner, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 174. NEW SERIES.

SATURDAY, MAY 1, 1847.

PRICE 1½d.

YOU WOULD LIKE HIM, IF YOU KNEW HIM.

PERSONS who only hear of each other, are found in many instances to entertain a mutual prejudice. Opposition in politics, variety of creed, rivalry in profession, and many such matters, give rise to this repugnance. Or it may spring from some of those mysterious caprices which sometimes lurk at the bottom of our minds. As, for instance, we may dislike a man because we hear him often spoken of, or his sayings quoted, or because we think he wears some part of his attire in a provoking manner. One great source of hatred, is a suspicion that the other party sets himself above us. We assume that he is proud, and then condemn him for the imaginary offence. Sometimes we suspect he hates us, and think it only right that we should hate him in return. Misunderstandings, frequently from the most trifling causes, also lead to estrangements which perhaps endure for life, while a short explanation, and possibly a mere show of concession, would remove every feeling of hostility, and render men of congenial feelings the best of friends. Endless, alas! are even the fictitious causes of mutual wrath and jealousy.

It is not uncommon, accordingly, to hear one well-enough meaning person railing at some other, of whom he has no certain knowledge. On such occasions, a bystander will quietly remark, 'You would like him, if you knew him.' This is often the truth. Did we know the man, we should find that we had dressed up, in imaginary peculiarities of a detestable nature, one who is, to say the least, a very passable kind of man, if not one of somewhat extraordinary good qualities. And many a time does it happen that we do, in time, become acquainted with the object of our aversion, and learn to look upon him with both esteem and affection. It is not, however, necessary for a change in our feelings towards the formerly hated stranger, that we should discover in him either very brilliant or very loveable qualities, or find that we have many points of common taste or opinion. It is enough, in most cases, for the desired revolution, that we have met, and conversed, and found each other human. Sweet are the words of courtesy between man and man: those who have exchanged the simplest greetings, find them like the eating of salt among the Arabs—a controlling bond of the most sacred kind. Hence, after a brief communion, the prejudice will vanish almost as mysteriously as it arose; and we part, acknowledging each other to be very tolerable persons, although not one word beyond commonplace may have passed between us.

There are some professions and courses of life more apt than others to raise ignorant hatreds. Literary men are said to be liable to such feelings in an unusual degree. So are artists. Perhaps the musicians are the

most discordant of all. It seems to be owing, in no small degree, to the reserved and solitary lives which these men almost necessarily lead. Some time ago, an economical kind of club was formed in London by the men engaged in the refined arts, and I am assured that it has already been the means of dispelling many groundless antipathies. The men come into social contact. Little favours and kindnesses are exchanged. They mutually find they are better than they had supposed. And the result is, that the exercise of high intellect becomes attended by those genial sentiments which are alone worthy of it.

Imperfect knowledge may be said to be the real foundation of pretty nearly all mutual repulsions. Reasoning from a single fact, or what is assumed to be a fact, and ignorant of a variety of redeeming circumstances, we suddenly rush to conclusions which are altogether unwarrantable on grounds of truth or reason. In this erroneous evolution of mind, there may, indeed, be a perverse disinclination to search for truth. Having formed a theory of cause and effect, seemingly complete in structure, there is an unwillingness to do anything likely to overturn the fabric, for it would amount to a confession of error, and damage self-esteem. Thus the man who, from a sudden, but, as he conceives, proper impulse, insults another, rarely makes any overture at reparation. He considers his judgment to be at stake, and will rather endure a life of painful resentment, it may be of remorse, than acknowledge that he could by any possibility be in error.

Nations, like men, hate because they know each other imperfectly. Were the French and English to make a point of spending a twelvemonth in youth in each other's countries, not as strangers in the hotels, but as members of each other's families, there would never again be war between them, for then would ignorant antipathies give place to mutual respect and kindly regard. The English pass in great numbers to France; but instead of uniting domestically with the people, they keep apart, and maintain all their own national habits; consequently little is done towards conciliation. Doubtless, however, it will not be so always. The facilities afforded to travelling will by and by produce a much greater interfusion of the people of the two countries; assimilations in manners and ideas will take place; and then capricious hatreds of all kinds must die a natural death. It is in this way that the material and mechanical doings of our age are yet to tell in great moral effects. Iron will, in time, be an instrument of love and union, as it has heretofore been one of captivity and oppression.

In the meanwhile, why should not both individuals and nations exercise some control over those emotions which lead to the antipathies of ignorance? Suppose we hate a man whom we never met or conversed with,

merely because he is of a different political or religious denomination from us, or because we think he must be a haughty man, or because we suspect he has no good feeling towards ourselves: let us reflect on what he might be, if we knew him—what pleasantnesses, what virtues we might find in him—what kindly feelings he might prove to be entertaining for us, all the time we thought him haughty and contemptuous—what community of design and aspiration there might be discovered beneath the various external profession—and we shall see cause for at least moderating or suspending our jealous notions, if not for substituting amicable sentiments in their place. Let nations in like manner imagine themselves acquainted with each other, so as to see with their eyes, what all travellers tell, that everywhere the charities of life are in some shape developed, everywhere is there much to love and admire; and then it could only appear absurd to cherish groundless jealousies, fears, and hatreds against the other families of our race.

RESISTANCE TO GREAT TRUTHS.

COPERNICUS AND ASTRONOMY.

THE history of astronomy, in common with that of almost every other science, presents numerous instances of arbitrary opposition to the development of thought and progression of truth. Dating from the infancy of our race, and originating where so many other mental phenomena took their source in the East, the young science developed itself in strange and uncertain forms, a gradual accumulation of extravagant opinions and wild hypotheses, until, by the labours of Hipparchus, Pythagoras, and the early Greek and Arabian philosophers, it was transmitted to Ptolemy, with some show of mathematical demonstration. Ptolemy was the first to unite the various phenomena, and form something like a complete treatise; but, leaving totally out of view the beautiful simplicity of nature, he based his system on impossible laws. He imagined the heaven to be an immense vault, revolving round the earth, which was stationary in the centre, in twenty-four hours, and interlined by innumerable circles—the orbits of the sun and planets. To account for the apparent contradictions in their motion, he contrived his famous cycles and epicycles, making the centre of some to roll round the circumference of others. Still, as a means of representing celestial appearances, the system of Ptolemy, with all its imperfections, was useful to science; and glimpses of the truth occasionally presented themselves to his successors. In the year 1252 appeared the famous Alphonsine tables, under the auspices of Alphonso, king of Castile, who distinguished himself by his devotion to the cause of astronomical science. The superstition of the day, however, opposed a formidable barrier to anything like progress. At length, in the fifteenth century, distinguished by so many great events, the genius appeared destined to change the whole face of astronomical science.

Nicholas Copernicus was born at Thorn, a city of Polish Prussia, in February 1473. He acquired the elements of Greek and Latin under the paternal roof, and afterwards studied philosophy and medicine in the university of Cracow, where he gained the title of doctor. His attention was, however, principally attracted by the study of mathematics; this he pursued with extraordinary zeal, and at the same time he obtained some knowledge of astronomy and the use of instruments. The fame of Regiomontanus inspired him with a desire to visit Italy; and at the age of twenty-three he set out for that country, where he first attended the lectures of the astronomer Dominic Maria, at Bologna. On his arrival at Rome, he was appointed to a professorship of mathematics; and after a residence in that city of several years, during which he pursued his astronomical observations, he returned to his native country. Through the influence of his uncle, the bishop of Warmia, he obtained a canonicate at Frauenburg, where he took up his residence, and continued his scientific studies. The openings which he

made in the walls of his chamber, in order to observe the passage of stars across the meridian, are yet to be seen in the house in which he lived. In the quiet and leisure afforded by his new position, Copernicus reflected on the doctrines taught by the astronomers he had visited, and comparing them with the ancient theories, was struck by the want of harmony in their arrangement of the universe. With a view to attempt the reduction of the discordant elements to some simple proposition, he read over a second time the existing works on astronomy. He found that Nicebas, and some other Pythagoreans, had made the sun the centre of all the planetary motions; while Apollonius of Perga, retaining the same general arrangement, made the sun in turn revolve round the earth—a system afterwards adopted by Tycho Brahe. Copernicus saw that the cycles and epicycles of Ptolemy were a confused attempt to explain the alternations in the movements of the planets, which he was led to believe might be accounted for by a much more simple process. The true relations of the parts to each other gradually unfolded themselves to his mind, until he became convinced of the immobility of the sun in the centre of the planetary system; while its apparent motion, and the alternations of day and night, were to be attributed to the annual and diurnal movements of the earth.

Something more than the mere possession of a great idea is required to constitute a great genius: there must be the faculty for looking at it in all its phases, and for testing it by the evidence of nature and of the senses. Copernicus had extensive astronomical knowledge, and a good geometrical genius, and the elaboration of his theory presents a memorable example of the power of patient and earnest thought in the investigation of a complicated subject, and acuteness of discrimination between the true and the fallacious. In his day, it must be remembered, the want of telescopes rendered all appearances in the sky much more difficult of explanation than they would have been a century later. To appreciate his services in the cause of science at their full value, we must place ourselves back in the times and circumstances that saw their birth. The accumulated errors and superstitions of fourteen centuries were not to be easily shaken or removed; neither were the prejudices and dogmas of the learned to be disturbed with impunity. What might have been astronomical science, was, even in the writings of the fathers, little better than a mass of absurd and subtle disquisitions on the substance of the heavens and planets. The latter were supposed to be hollow, and to be placed immediately under the waters, which were above the firmament, in order to keep it cool; while the earth floated in the waters which were under the firmament. The moon, too, came in for a due share of notice in the controversies: some asserted that her spots were the body of Endymion; others declared them to be a lion with his tail to the east; and a third party contended that she was made of pumicestone, and showed a human face. The doctrine of the earth's immobility was everywhere taught by the learned, and universally believed by the multitude. Of course any attempt to substitute a new theory could not fail to provoke much clamour.

Nevertheless, with the resolute perseverance that frequently accompanies true genius, Copernicus commenced a series of observations by which to verify his calculations; and having constructed the necessary instruments, he paused not in his investigations until the tables required for the prediction of the phenomena were completed. About the year 1507 he began to commit his thoughts to writing; and in 1530, at the age of fifty-seven, he had the satisfaction of seeing his manuscript labours brought to a close, in a work divided into six books, entitled '*De Revolutionibus Orbium Coelestium*,' in which the whole theory is 'reduced to one simple idea, exhibited with clearness and precision, constituting what is now known as the Copernican System; that is, that the sun is the centre of a system of planets which revolve round it, and that, consequently, the earth moves. The real distances of the planets, and the declination of the pole of the earth, were also explained.

However firm the conviction of Copernicus as to the

truth of his theory, he yet hesitated to make it public, dreading the opposition it would have to encounter, seeing that it opposed the inveterate prejudices of the learned, and the illusory testimony of the senses. It is one of the hereditary superstitions of human nature to contend pertinaciously for the canons we have once admitted, although only on the ground of custom. The less to offend the spirit of the age, Copernicus made scarcely any announcement of discoveries, and sought rather to disguise their novelty and importance under an assemblage of opinions derived from ancient writers. The fame of the new theory, however, found its way to the popular ear; and the first sign of opposition was manifested in a comedy, in which, like Socrates, the great astronomer was made the subject of ridicule. Yet such was the influence of his dignified and unobtrusive character, that the play never went to a public representation.

Moved at length by the urgent intreaties of some of his friends, and considering that delay only strengthened the cause of ignorance, Copernicus intrusted his manuscript to his friend and disciple Rheticus, under whose care it was eventually published at Nuremberg in 1543, with a long explanatory title, commencing 'Nicolaï Copernici Torinensis, De Revolutionibus Orbium Coelestium Libri vi,' and ending 'Igitor Erne, Lege, Fruere.' The book opens with a prefatory dedication to Pope Paul III., who is informed that the author had kept it by him for nearly four times the nine years recommended by Horace. Remembering that Lactantius had ridiculed those who asserted the globular form of the earth, he awaits similar criticism on his own researches, and doubts whether he would not do wisely to imitate the Pythagoreans and some other philosophers, who communicated their doctrines to their disciples only, not from jealousy, but fearing the contempt of the ignorant. He concludes with a reason for the publication—'It is,' he says, 'that I may not be charged with shunning the judgment of enlightened persons, and that the authority of your holiness may protect me from the teeth of slander.'

In May 1543, at the age of seventy, Copernicus died: the first copy of his book, forwarded by Rheticus, was placed in his hands only a few hours before he breathed his last. He appeared to be scarcely conscious of the object to which so many years of his life had been devoted. But his mission was accomplished: committed to the perpetuating operations of the infant printing-press, all danger was over of losing the germ of those great and fertile truths which, in our days, render astronomy the most perfect of sciences. The opposition to the new truth, anticipated by its illustrious author, was not slow to manifest itself—the intolerant spirit of the church, and of the Aristotelian philosophy, which rendered it almost as dangerous to offend the one as the other. Those were the days when the fagot and stake made short work with those who presumed to strike out a course of thinking for themselves. In the very year that Copernicus died, the celebrated Ramus, then a teacher at Paris, was censured by an edict of Francis I., as having manifested his ignorance by rash, arrogant, and impudent animadversions on Aristotle. The learned party, as was truly observed of them, were 'determined to punish as heresy what they could not refute as false philosophy.' Half a century later, they burned Giordano Bruno at Rome, for making himself conspicuous as a teacher of the Copernican doctrine, and an unsparring opponent of the Aristotelians. He has left us, in one of his writings, an instructive sketch of their character:—'They harden themselves,' he says, 'and heat themselves, and embroil themselves for Aristotle; they call themselves his champions; they hate all but Aristotle's friends; they are ready to live and die for Aristotle; and yet they do not understand so much as the titles of Aristotle's chapters.'

Among bigots so unscrupulous, the Copernican theory was little likely to meet with a favourable reception. Foremost in active opposition we find the Jesuits, who attacked it with all the virulence and learning for which their order has so long been celebrated. According to them, the new opinion was 'true in art, but false in nature;' and they were not sparing of denunciations on

the genius that had refused to be guided by their dogmas. Fienus, physician to the emperor of Bavaria, followed on the same side; and the celebrated Danish astronomer, Tycho Brahe, rejected the theory of his Polish predecessor, urging against it many, at that time, incontrovertible objections, supported by reasons drawn chiefly from Scripture. His principal argument against the motion of the earth was, that with an orbit of nearly 190,000,000 of miles in diameter, some change in the position of the fixed stars would be detected during its annual revolution. Copernicus, however, had proved that the fixed stars are too remote to be affected by the passage of the earth from one extremity of its orbit to the other; but the belief which placed the earth as the centre of the planetary motions, and made man the object for which all moved around him, was too flattering to the human mind to be easily abandoned. Tycho's opinions found many supporters; among whom the astrologers played no unimportant part. The casters of nativities were vehemently opposed to the opinion which added a planet to the recognised number, and disturbed all their calculations of starry influences. Their interest lay in fostering the popular prejudices. Seven, they contended, was a mysterious number: man, in his mouth, eyes, ears, and nostrils, has seven entrances to his head; a sufficient reason why there should be no more than seven planets in the heavens. That such absurdities were ever seriously entertained, might well be doubted, were it not for the ignorance which, in our own day, demands an edition of 200,000 of that notorious juggle, Moore's Almanac.

In proportion as the Copernican theory became known, did its opponents increase. Maestlin, who was afterwards Kepler's preceptor, gave to each planet seven principal spheres, which he denominated eccentricities, epicycles, and concentricitycles. Frascatoro ridiculed the notion that the stars moved in space: 'Not only reason,' he writes, 'but the very senses inform us that all the stars are carried round fastened to solid spheres.' In 1620, Copernicus's work, 'De Revolutionibus,' was condemned by the heads of the church at Rome, and inserted in their 'Index' of forbidden books, where it still remains. A few years later, Melchior Inchoffer, another Jesuit, wrote a treatise, in which he believed the question was finally disposed of. He quotes numerous texts of Scripture, and contends that the first verse of Genesis proves the earth is in the centre, since, in the formation of a sphere, the circumference must first come into existence. Many others of lesser note were equally ready with their contributions to the general error; and the epithet applied to one, a Veronese capuchin, by Micanasio of Venice, whom he had consulted on the printing of his book, will characterise them all—'He is,' said the latter, 'an ignorant beast, and is so enamoured of his absurdities, that he believes them more firmly than his Bible.'

The spirit with which the new doctrine was received in Italy is strikingly illustrated by many passages in the life of Galileo. This great man relates that the discourses of the German, Christianus Urstinius, on the Copernican system at Padua, were listened to as 'a piece of solemn folly.' Writing to Kepler of some of his own observations, he says, 'I have not yet dared to publish them, fearing the fate of our master Copernicus, who, although he has earned immortal fame among a few, yet by an infinite number (for so only can the number of fools be measured) is exploded and derided;' and it was not without many subterfuges, to which the author was compelled to resort, that the publication was finally accomplished. Galileo's advocacy of the Copernican theory exposed him to ecclesiastical censure. 'The proposition,' so ran the sentence which condemned him to punishment, and his book to the flames, 'that the sun is in the centre of the world, and immovable from its place, is absurd, philosophically false, and formally heretical; because it is expressly contrary to the Holy Scripture.' Controversies on the new system sprang up over the whole of Europe: in 1648, Morin, a Frenchman, published his 'Alae Terræ Fractæ'—['The Wings of the Earth Broken'], fully satisfied that he had completely demolished the theory of the

earth's motion. The doctors of the Sorbonne were about to pronounce against the innovating opinions, but were restrained by an appeal from one of their body, whose name has not been preserved. The famous Descartes said, entertaining the same mistaken views, 'I see nothing in Galileo's books to envy him, and hardly anything which I would own as mine.'

The frontispiece to Riccioli's '*Almagestum Novum*,' published in 1651, contains a curious illustration of the prevalent feeling—a figure with a pair of balances is seen weighing the Tychonian against the Copernican system: the truth of the former is shown by its overwhelming preponderance. This writer gives the names of fourteen authors who, up to his day, had written in favour of the Copernican theory, and thirty-seven against it; he brings forward seventy-seven arguments in support of the latter, and finds only forty-nine for the former: consequently, the mere force of numbers proved the impossibility. He urges a very general objection of the time—that if the earth did really turn on its own axis, things thrown up would not fall on the place from which they had been cast, and all loose objects would fly off like water from a wheel. A bird leaving her nest would never be able to find it again; and if a man leaped up but for one second, the earth in that time would have turned away from him a quarter of a mile. In vain had Copernicus declared that the atmosphere and everything on the earth partook of its motion—the evidence of the senses was against him. On Riccioli's own showing, the new system had not been left entirely without defenders. Among these the most able were Kepler and Galileo, both equally ardent and indefatigable in their search after truth. Referring to the subject in one of his letters, the learned Pascal wrote—'If we have unerring observations proving that it (the earth) turns round, not all mankind together can keep it from turning, nor themselves from turning with it.' Even Riccioli himself, notwithstanding his two folio volumes of adverse theories, was constrained to say—'Never can we sufficiently admire the genius and sagacity of Copernicus, who, by the motions of a globe like the earth, has explained what astronomers have never been able to represent without an absurd complication of machinery; and who, disengaging the fixed stars from their rapid diurnal motion, so difficult to reconcile with their general motion round the poles of the ecliptic, has happily explained the stations and retrogradations of the planets, and the precession of the equinoxes; who has destroyed three enormous spheres; who lastly, like Hercules, has been able to sustain alone a weight that has so often crushed an Atlas.'

Turning to our own country, we find Bacon, with all his genius, disinclined to admit the motion of the earth. Milton too, although struck with the want of harmony in the heavens, which he describes as

'With centric and eccentric scribbled o'er,
Cycle and epicycle, orb in orb.'

seems also to have doubted the truth of the new theory. But the most active opponent was Alexander Rosse, a voluminous Scottish writer, alluded to in *Hudibras*. If, however, churchmen had signalled themselves by opposing the Copernican system, let it not be forgotten that it is to a bishop we owe the first recognition of that system in England. Bishop Wilkins—all honour to him for his intrepidity!—clearly demonstrated, in reply to Rosse, that the earth is one of the planets; and that it performs revolutions round the sun. The writings of Wilkins did great service to the cause of truth; still the truth was slowly received, because it was at variance with a firmly-planted prejudice. The appearance of the '*Principia*' of Newton, and the advancing spirit of intelligence, it might be thought, would have shown the utter uselessness of any further discussion on the subject. But in 1705 a work by the Hon. E. Howard was published at London, entitled '*Copernicans of All Sorts Convicted*.' So lately as 1806, Mercier, a Frenchman, wrote to prove '*L'Impossibilité des Systèmes de Copernic et de Newton*;' and again, even so recently as 1829, an individual was found silly enough to publish a book called '*The Universe*

as It Is: wherein the Hypothesis of the Earth's Motion is Refuted, &c. &c. By W. Woodley.' This writer quotes the works of the deluded Richard Brothers as of more authority than all scientific treatises whatsoever. 'The world looks back with surprise,' observes an eminent writer,* 'at the error of those who thought that the essence of revelation was involved in their own arbitrary version of some collateral circumstance. At the present day, we can hardly conceive how reasonable men should have imagined that religious reflections on the stability of the earth, and the beauty and use of the luminaries which revolve around it, would be interfered with by its being acknowledged that this rest and motion are apparent only.'

Such were some of the arguments opposed to the truth of a system whose very irregularities are now proved to be confirmatory of its harmony. 'What a sublime and instructive picture is thus presented to man! While he and everything around him bear the impress of his fleeting nature—while even the solid globe on which he treads is rent by convulsions, and agitated in the conflict of its elements—yet does the general system stand unshaken amid the oscillations of its parts, and thus testify to each generation, as it comes, the wisdom and the power with which its great Architect has provided for the stability of his material throne.'

THE ONLY SON.

THE Rev. Cyril Danvers was about to ascend his village pulpit to preach his first sermon. A formidable effort was this to the young curate, for he was hardly six-and-twenty, and of a studious and retiring disposition. He stood in the little vestry, while the old man who fulfilled the combined lay and clerical duties of gardener to the rector, verger, and sexton, arranged his gown with ceremonious care. The tiny cracked looking-glass over the fireplace reflected the young clergyman's face—fair, and pleasant to look upon, but now changing from red to pale, like that of a timid girl. The last verse of the simple, but sweet and solemn hymn, resounded from within, warning the curate that he must muster up all his courage. A respectful 'God be with you, sir!' from the old man, turned his thoughts from his own natural timidity to the high and holy duty he had to perform; and the young curate walked from the vestry to the pulpit, with a pale face, indeed, and a beating heart, but with a quiet and religious feeling that befitted the time and place.

As Cyril Danvers began, his voice trembled, for he thought how much depended on this his first sermon; for on his talents and success hung the hopes, almost the means of subsistence, of a widowed mother and two young sisters; but as he proceeded, the sacredness of his task drove away all worldly thoughts, and he spoke with an earnest enthusiasm that went to the hearts of his simple hearers. Perhaps Cyril felt relieved that they were chiefly of the humbler class, and that his own good, but somewhat cold and stern superior, was absent from his pew, whose only occupant was the rector's daughter, Lucy Morton. We fancy all *Lucies* must be fair, and gentle, and good; and Lucy Morton did not belie her name, so that the young curate need have feared no harsh criticism from her. He was too lately arrived in the village even to know her by sight; but a passing glance at the rector's pew showed him a sweet face, lifted up with such pious and earnest attention, that it gave him courage; and Cyril Danvers ended his first sermon, feeling that the great effort of his life was over, and over well.

He walked to his lonely home through the quiet meadows, that lay sleeping in the Sabbath sunshine of June, with feelings of calm and thankful gladness, and thought of his future life with less doubt and hopelessness than he had done since the day when the young collegian had been called home to his dying father, to

* Whewell: *History of Inductive Philosophy*.

have intrusted to his loving care the three helpless women, whose sole stay and succour in this world was the only brother and only son. What a charm there is often in the words 'only son!' Sometimes it conjures up visions of petted childhood, unrestrained youth, heirship to broad lands, and everything that undivided love and fortune can bestow. But Cyril Danvers had to prove the darkness of the other side of the subject, when family cares, heavy enough for ripe manhood, overwhelm the youth of an only son, who has so many dependent on him alone, until nothing but love can make the burden lighter.

However, the young man had borne and triumphed over many cares; and when at last, a few weeks after the Sunday with which our tale begins, he brought his mother and sisters to a small but pretty cottage within a short walk of his new curacy, Cyril felt the quiet content of a man who has done his duty so far, and has reason to look forward to a season of tranquillity and happiness. Most joyful was he in having secured a home for his aged mother, and the two young and beautiful creatures who called him brother. But for him, these would have been thrown on the bitter world in utter helplessness; for, a hundred years ago—the date of our tale—women were but imperfectly educated, nor held the same position in society which they now justly sustain, and it was almost impossible for a young female, plunged from affluence into poverty, to gain a livelihood by any of the many ways through which unmarried and unprotected women may in our days honourably and successfully struggle against hard fortune. For this reason, the high-principled and affectionate brother murmured not for a moment at his burden, but was thankful that his own hardly-earned salary, and the poor remnant of his mother's dowry, would suffice to keep Frances and Jessie from suffering the bitterness of want.

The summer passed lightly and pleasantly over the curate's little family. There had been time enough to remove the shadow of death which had overwhelmed them when their father was taken away. The sisters and brother were all young, and in youth life is so easily made pleasant! even the void which death leaves is not eternal; and now the sole token of him who was gone, remained in the mourning garb of the widowed mother, which she would never lay aside, save for the garments of eternal rest. Light-hearted Jessie sang like a bird once more; was wild with joy at living in the beautiful country; and enticed Cyril from his books, and Frances from her charities in the village, where she and the rector's daughter were the good angels of the poor and needy. Lucy Morton had at first sight liked the curate's eldest sister, and the liking soon became love. Not that they were similar in disposition, for that friendship does not always require. Lucy's nature was joyous as a sunny summer's day, while Frances was like the same day—calm, serene, but sunless. Hers was the temperament over which sorrow never passes lightly, and she had one bitterness which her brother and sister were spared: Frances had loved, deeply and truly, and her change of fortune had for ever parted her from that love. She did not sink under the loss; but her smiles were less frequent, and more sad; and many of her companions used to say that Frances Danvers, at four-and-twenty, looked like one certain to be an old maid.

Nevertheless, every one loved Miss Danvers, from the village children, whom she taught to sing—to the wonder and annoyance of the rural Orpheus, a blacksmith, who was wont to lead the church-music, showing forth his six-feet height and stentorian lungs in front of the gallery—even to the grave rector himself, who invariably seemed pleased to see the gentle and ladylike Frances as his daughter's companion. Together they visited the poor and sick, often meeting, in their rounds, with the curate himself, on whom devolved much of the pastoral duties of the parish, and whose gentle manners, and earnest but unobtrusive zeal, endeared him every month more and more to the simple people among

whom his lot was cast. In this primitive region there were few above the rank of farmers, so that the rector's daughter, while too gentle to despise her more uncultured neighbours, felt and expressed herself very happy in having found associates of her own age, similar in station, education, and pursuits to herself.

The frank-hearted and unsophisticated Lucy did not disguise her love for Frances, nor the sincere pleasure she felt in the society of Cyril. Her laugh was gayest, her sweet face brightest, when he was by; until the student ceased to shut himself up with his books, and his countenance wore a look of continual happiness, which gladdened his mother's heart. All the winter, the four young people met almost every day; and it was only when the spring brought to the rectory a visitor, who took away a slight share of Lucy's society from them, that the curate and his sisters began to think how dull their little parlour was without the bright smile and cheerful voice of the rector's daughter.

Miss Hester Dimdale, Lucy's guest, was one of those plain but attractive girls who make tact, good sense, and good nature atone for the want of beauty. She was very lively and open-hearted: too much so, perhaps, for she had a way of telling unpleasant truths, and of making cutting remarks, which she called 'speaking her mind,' but which was often anything but agreeable to the feelings of others. Her penetration discovered at once the state of things between her friend Lucy and the Danverses, and a few pointed words at once tore the veil from Cyril's eyes: he beheld his own heart, and while he saw, he trembled.

'Why are you so thoughtful, Cyril?' asked Frances one evening after she had for some minutes watched her brother, who sat with a book on his knee, though evidently not reading.

Jessie started up and looked over his shoulder. 'Why, he has been sitting here an hour, and has not even turned over the second page! A pretty student is my clever brother becoming!' said the laughing girl, shaking her curls in his face.

Cyril looked confused. 'I fear I am getting lazy, Jessie; but I have so many things to think about and to do.'

'And is that the reason you have been so grave lately? Why, Cyril, I have hardly seen a smile on your face since—yes, ever since Hester Dimdale came.'

'Is that the grand era, then?' said her brother, forcing the long-absent smile to his lips.

Jessie looked very wise. 'Ah, I see how it is!' she answered in a sedate whisper. 'I know what has come over the grave Cyril Danvers—he loves some one!'

'Yes, I love my mother, and you, little torment!' interrupted the young man quickly, as he stooped over his kneeling sister and kissed her cheek, so that his face was hidden from her view.

'What! and not Frances too?' archly said the merry Jessie.

Cyril turned towards the elder sister a look which needed no words: it was evident he loved her even more than he did the gay damsel of eighteen, who was ever the pet of the family. Then he took up his book, and went silently into his own room.

The gay girl had touched a chord that vibrated fearfully in her brother's heart. Cyril did love, and love passionately; and he knew it was all in vain; for how could he hope to marry? Even had Lucy loved him—he never thought she did; but even had it been so, how could he tear from his heart and home those dear ties, without which cruel severance he could not hope to take a wife? The strife was very bitter in the young man's bosom. He had been so happy with his mother and sisters; and now it seemed that they stood between him and the girl he loved, so that, without sacrificing them, he could never hope to marry her. Sometimes he felt thankful that Lucy seemed not to love him, or the struggle would have been harder still. But then she regarded him kindly—he might soon have gained her love, had he dared; and her father was a kind,

good man, who would not oppose his child's happiness. Then poor Cyril fell at once from his pictured dream: he thought of his deserted sisters, alone and unprotected by the shelter of a brother's love, knowing that his income and his home were now the right of another, and they were desolate. He could not be the cause of this—not even to win Lucy.

No wonder was it that such an agonizing strife in his heart made Cyril's face mournful, much as he strove to hide his feelings from every eye. But it was terrible to have at times to struggle with the bitter thoughts that would rise up against the innocent ones who knew not how much he sacrificed for their sakes; and to be in the presence of her who had awakened this passionate and fatal love, was almost more than the young man could bear. He would have sunk under the conflict, but that it did not last long.

One day Hester Dimsdale came to announce her sudden departure, and Lucy was to return with her for a twelvemonth's visit to London; and the two girls had come to bid an abrupt adieu at the cottage. Frances was rather pained to see that her sweet friend Lucy so little regretted the parting. She might have been more sad; but then she was so young and gay, and was going to so many anticipated pleasures! When Lucy kissed Mrs Danvers with a tearful adieu, Frances forgave her at once for looking so happy. Cyril saw nothing, felt nothing, except that Lucy was going, that his heart was riven with despairing love, and that he must conceal it.

Frances and her brother walked home with them, in the twilight, across the still meadows. Cyril felt as if dreaming. He only knew that Lucy's hand trembled on his arm, and that her downcast face was sad as she spoke of her departure.

'Are you sorry to leave us?' asked Cyril in earnest tones, that mocked his attempts to conceal his feelings.

Lucy did not speak, but one large tear fell on the handful of bright flowers which Mrs Danvers had, for the last time, gathered for her favourite.

Another moment, and Cyril would have forgotten all his resolves, and poured forth his impassioned love; but Frances unconsciously turned round. He saw her pale, languid, though beautiful face, and the weakness was gone. The son and brother would not forsake his duty even for love.

When, after a passing silence, Lucy's voice beside him sounded cheerful as ever, Cyril thought with a stern joy that his love was unreturned, and became calm once more. As they parted, he looked with one fixed gaze of intense affection in her face, half raised her hand to his lips, then relinquished it without the kiss, drew his sister's arm within his own, and turned homeward.

For many weeks after Lucy had departed, the village seemed desolate indeed. So the curate's sisters felt and said; and Frances, with a quick-sighted earnestness, given by her own olden love, watched her brother's every look. But he seemed calmer than usual, spoke of Lucy in his usual tone, read her frequent letters, and even sent some few kind messages in answer to hers. The anxious sister was deceived. Concealment was impossible to her own womanly nature; she felt satisfied that she had been mistaken, for Cyril never could thus have hidden his love. She knew not the extent to which love can give strength of purpose.

It happened, too, that before very long another subject engrossed the thoughts of the tender sister. The gay and beautiful Jessie gained a lover; one who had seen her at the village church, wooed, and won her; for he was comparatively rich, handsome, and good withal, and worthy to be trusted with the youngest darling of the family. So in a few months Jessie Danvers became a bride.

There is always a vague sadness attendant on the first wedding in a family. It is the first tie broken, the first bird that leaves the nest to venture, on half-fledged wings, in a world untried. Mrs Danvers wept almost as much at her daughter's wedding as at her

husband's death. Frances, too, was sad: it brought back her own love-sorrows—unspoken, but still unhealed. Cyril only seemed cheerful: he was sorry to part with his sister, his pretty plaything from boyhood. But then Jessie was so happy; she loved, and was beloved; and the brother acknowledged to himself, without feeling it to be a sinful thought, that thus one bar had been removed from between himself and Lucy Morton. Cyril knew that she was still free, for she wrote unreservedly to Frances; and the delicious hope would come oftener and oftener to his heart, that sweet Lucy might be his wife after all. The young curate was always delicate in health; but now renewed hope lent a colour to his cheek, and a firmness to his step, so that when Frances left the village to pay a visit to the bride, she only quitted one happy home for another. As the affectionate sister looked upon Jessie's beaming face, and remembered Cyril's cheerful adieu, she felt glad that there was still happiness in the world; though, in her own bitter loneliness, she thought of the past, and wept.

The time did not pass wearily with Cyril and his mother, even though the visit of Frances extended from weeks to months. Her letters, too, had a cheerful, hopeful tone, which cheered them both; and Cyril, who knew not how deeply that sad first-love had entwined itself with every fibre of his sister's heart, thought with pleasure—in which it surely was hardly wrong if one selfish idea combined—that there might come a time when Frances too would be a happy wife, and his own reward for all he had sacrificed might be Lucy Morton's love. Thus Cyril would dream, as he sat by his winter fireside, and thought how that fireside would look with his aged mother in her arm-chair, and a young wife in the other, who wore the sweet face of Lucy Morton, until his countenance seemed radiant with joy, and Mrs Danvers would rouse her son from his reverie, to ask him what he was thinking about to make him look so happy.

When winter was stealing into spring, Frances suddenly returned. They had not known of her coming, and both mother and brother gazed with wondering delight on her face. She was still pale, but there was a soft light in her blue eyes, and a tremulous smile playing about her mouth, that told of some happy secret. After a few hours, Frances said, with a deep blush, that made the transparent cheek glow, until the once sedate Frances looked as beautiful as Jessie, 'Dear mamma! shall you be glad to see an old friend? Charles—that is, Mr Wilmington—said he should be passing Elmdale to-morrow; and—and—'

Frances could say no more; her arms were thrown round her mother's neck, and the blush and the smile ended in tears more delicious still. The secret was told: she had again met him, so long remembered; death had claimed the harsh father on whom he was dependent; and Charles Wilmington was free to woo and wed his early love. So the gentle Frances was not destined to be an old maid, but a happy wife, and that ere long.

'Why did you not write to us of this, my most mysterious sister?' asked Cyril, when he had given his warm brotherly congratulations.

'Because—because I thought I would rather tell you; and you know good news will bear delay,' said Frances, laughing and blushing.

'Then I had better delay mine. But no; I must tell you: old Mr Calvert died last month, and I was this morning greeted as rector of Charlewood.'

'What! the pretty village close by? I am so glad! My dear, dear Cyril, how happy you will be!' cried Frances joyfully.

'How happy I am!' answered her brother; and no one who looked on his radiant face could doubt it.

The brother and sister took their old twilight walk together through the green meadows that led to Elmdale. They were too happy to talk much; but they breathed the soft evening air, and looked at the tinted clouds, and thought—as hundreds of young hearts have

done, are doing, and ever will do—how pleasant is the evening of spring, and how sweet it is to love! Suddenly, from the old church of Elmdale, came the cheerful sound of marriage-bells; Cyril and Frances glanced at one another with that beaming half-conscious smile, the free-masonry of love.

'Who are those bells ringing for?' asked Cyril of the old sexton, who was hastily crossing the field.

'Don't you know, sir? But master went away, and told nobody, I think. It is Miss Lucy: she was married to a grand London gentleman yesterday morning.'

'Then that is the reason she has not written to me for so long,' said Frances, as the old man walked quickly away. 'But Cyril—oh, Cyril!' the sister almost shrieked, as she turned and saw the fearful expression of her brother's face. In a moment Frances read there the tale of hidden, self-denying, and now hopeless love. Without a word she led him to a bank, for he could not stand; and there, with his sister's hand in his, and her face bending over him in fearful sympathy, Cyril gave way to all his love—all his despair. Merrily the wedding-bells rang on: they sounded now like a funeral knell to the two, who went home through the gathering darkness. The gloom without was nothing to that within the hearts of both. How all things had changed in one little hour!

Charles Wilmington came, but his affianced bride met him with a welcome in which there was more of sadness than joy. Frances wished to defer her marriage; but Cyril would not suffer it. He gave his sister away to her long faithful lover, and tried to congratulate them, and to smile cheerfully; but it was a mournful wedding. Frances felt that her presence gave Cyril an additional pang; her own happy love was too strong a contrast to his desolate sorrow. The sister saw that it was best she should go; yet, as the carriage whirled her away, ever and anon that pale, agonized face floated between her and the husband so dearly loved; and amidst her bridal happiness, Frances mourned for her brother.

Cyril and his mother were now left alone together. He had exacted a promise from Frances, that neither this fond mother, nor Jessie, should ever be pained by the knowledge of his fatal secret; and so Mrs Danvers came to live at Charlewood Rectory with a feeling of unmixed pleasure and hope. Sometimes she thought her son looked sadder and paler than he had done for some months; but then Cyril was always grave, and never very strong. His new duties also took him so much away from her; for he was none of those idle shepherds, who think one day's tending in the week enough for the flock. And Cyril, however weary he came in, had always a smile and a cheerful word for his mother. He was too gentle and good to make her suffer for the deadly gloom which had fallen over his whole life: it was not her fault, nor that of his innocent sisters, that he had lost sweet Lucy Morton.

That name now was never breathed, save by Cyril himself, in the lonely hours of suffering, of which no one knew. She did not revisit Elmdale, but went abroad with her husband. Change of abode happily removed Cyril from many haunting memories of his lost love; and to every one else it seemed as though she had never been. After some years, many began to wonder why the young rector of Charlewood never married; but then he was so devoted to his aged mother, it might be that there was no room in his heart for any other love. Jessie's troop of children sported round their quiet, pale-faced uncle; and Mrs Wilmington, too, came with her little Cyril, so like his namesake, even in childhood. Frances saw that her brother was calm and content, engrossed with his high and holy calling. He never mentioned Lucy; and the sister returned to her beloved home, satisfied that Cyril was at peace, if not happy.

And she was right. Sorrow that brings with it no self-reproach can be borne in time with patience. Cyril had in great measure learned to look on life with less bitterness; he no longer suffered the uncontrollable

anguish which had at first prostrated him in the dust; but he never again recovered the cheerful spirit of old. It has been said that men never love like women—that they soon recover from a loss such as Cyril had felt: but this is not true. Rarely does a man love with his whole soul, as a woman does; but when he does, the passion lasts for a lifetime, with an intensity unknown to most women. Cyril's love had engrossed every feeling of a sensitive nature, united to a delicate frame, and neither ever completely rallied from the shock.

Every year that passed over Cyril's head, his slight form became more bent, and his face more colourless and thin. When little past thirty, he looked like a man whose prime of life had gone by. Winter ever brought with it pain and failing health, so that he was obliged to relinquish many of his duties to his curate. For months he seldom went beyond the rectory and the church, where his voice was still heard, but fainter and more unearthly each Sabbath that came. He rarely visited Elmdale, for Mr Morton had died not long after Lucy's marriage.

One Sunday, however, the then vicar requested Mr Danvers to supply his place at Elmdale church, and Cyril assented. It might be that he had a vague presentiment that it would be the last time he should lift his voice from the spot so hallowed by many old recollections. As he stood in the little vestry, all looked the same as ten years before, when he was about to mount the pulpit for the first time. It was the same season too, and the June sun lighted up the old walls as it did then. As Cyril passed up the stairs, he almost expected to see Lucy Morton's face again in the rectory pew.

In that pew, which was generally vacant, sat a lady and two blooming children. She raised her bowed head when the prayer was over, and Cyril beheld his first, his only, and lost love. Lucy sat in matronly grace, with her babes by her side, happiness and peace shining in every feature of her still beautiful face. A mournful shade passed over it when she looked at him whose love she never knew. What a contrast was there between the two now!

Cyril preached with a voice that was hardly more tremulous than usual. He shut out all earthly love from his eyes and his heart. But as he descended the pulpit, his very lips had an ashen hue, and the retiring congregation heard with pity and regret that he had fainted on reaching the vestry. The old sexton—he was living still—said that the long walk had been too much for poor Mr Danvers; and the farmers' wives shook their heads, and said that he was always too good for this world. Meanwhile Cyril went home, and never recrossed his own threshold more.

But though, in a few days, he lay down on his bed to rise no more, it was some weeks before the dread shadow folded his still arms round his prey. Frances came to her brother, and Cyril talked with that calmness and peace which the near approach of death often gives of all the past. His mind was clear and joyful. He spoke of Lucy; and with the quick ear of sickness, distinguished her voice and footstep in the room below, where she came almost daily to inquire about him, and to see her former friend. At first Frances could hardly bear to look upon her; but then she thought how wrong such feelings were, and listened to Lucy as she spoke of her beloved and kind husband, and her beautiful children, though it gave her many a pang when she remembered him who was now fast departing.

One morning Lucy came earlier than usual. She sat many minutes alone, and then Frances's footsteps sounded slow and heavily on the stairs, and she entered.

Lucy's eyes asked the question her tongue could not utter.

'All is well with him now,' said Frances, and her voice was strangely calm. 'My brother is at rest.'

Cyril had died that morning.

A few days after, Lucy and Frances sat together in

the darkened house. It was the night before all that was mortal of poor Cyril was given to earth. They could now speak of him without tears; and they talked of old times, and old pleasures shared with him who was no more.

Frances took the hand of her former companion. 'All is changed with us now, Lucy; we are no longer young, and our feelings are different from what they once were. It can do no wrong, either to the living or the dead, if I tell you, now that you are a cherished and devoted wife, that he who is gone loved you with a passionate love which ceased but with life.'

Lucy's face grew pale, and she burst into tears. 'Why—oh why did I never know this?'

'Because he could not hope to marry; and he was too honourable to drive his sisters from his home, or to bind the girl he loved by a doubtful engagement. He saw you did not love him.'

'Because he never said one word of love to me, or I should soon have learned to love him, and then he might not have died!' said Lucy, still weeping.

'Hush, Lucy! All is best now. You are happy—you love your husband.'

'I do love him; and he is worthy to be loved,' answered the wife earnestly. 'But poor, poor Cyril!' and again she wept.

'Do not mourn for him,' said Frances; 'he might never have had a long life; and who shall say that he did not feel the sweet peace of duties fulfilled, and of knowing that his self-sacrifice was not in vain? Lucy, I, Cyril's sister, amidst all my grief, shall love you, and feel that you have done no wrong. Yet it is very bitter!' cried Frances as her composure forsook her, and she bowed herself in agony. 'Oh, would that I had died for thee, my brother—my only brother!'

FORTUNES OF PHILIP YORKE.

THERE was once a little lad called Philip Yorke, who was born in the year 1690. His paternal ancestors had been of some consideration in the county of Wilts, but that was an old story now; and his father, who practised as an attorney, was very well contented to marry his two daughters, one to a dissenting minister, and the other to a tradesman in a country town. As for his mother, she was of the family of Gibbon—a rather famous name, having been borne by the historian of the latter days of Rome—who boasts of some alliance with a certain Lord Say and Seale, who was brought into notice by Jack Cade. Indeed his lordship, if we are to believe the historian, distinguished himself by his own misdeeds—inasmuch as he had 'most traitorously corrupted the youth of the realm in erecting a grammar-school, causing printing to be used, and, contrary to the king, his crown, and dignity, building a paper-mill—talking of a noun and a verb, and such abominable words as no one can endure to hear.' But all this was gone by; and the little lad, whose family could look back so far, was fain to get any education that was going at a school kept by a dissenter in Bethnal Green. At fourteen, his father desired to bring him up to the law; but his mother, who was in the way of knowing what the law was, insisted upon 'some honest trade' being found for the boy. Still, when a desk was offered him in the office of a respectable attorney in London, she did not persist in her scruples; and accordingly Philip Yorke mounted his desk seat in Brooke Street, Holborn.

Here, young as he was, he set himself to business in downright earnest, and very speedily attracted the attention of his master by his uncommon assiduity. But he did not confine his labours to office hours. The great obstacle in his way was a defective education, and this he set himself to remedy with zeal and perseverance. He was not contented with acquiring the necessary knowledge of law Latin: he would likewise read the classics. It is true he was never quite *au fait* of the prosody, and to his dying day was very shy of quota-

tions; but it was a great thing to be able to construe Virgil and Cicero. As for Greek, he did not pretend to be so far learned as that. His master was at length so well satisfied with his conduct, and so convinced that talents and industry like his only wanted encouragement to be followed by brilliant results, that he entered him as a student in the Temple. Here was a chance for young Philip Yorke! But even this dignity had its attendant indignities; for the attorney's wife considered it only fair and proper to make the 'gratis clerk' useful, and therefore never scrupled to despatch him on family errands, highly derogatory to the honour of a Templar. When this had gone on for some time, the master, in settling his periodical accounts with Philip, was surprised to find such entries as these: 'Coach hire for roots of celery and turnips from Covent Garden market';—'Ditto for a barrel of oysters from the fishmonger's'; whereupon a consultation took place between the husband and wife, in which it was decided that the practice of the latter was clearly against the rules of good housewifery.

It must not be supposed, however, that Philip's professional business was very dignified. Attending captions, and serving processes, are not very gentlemanly employments; but they were necessary to a young lad who could contemplate nothing but the necessity, when his studies were over, of going upon the roll of attorneys, with perhaps a misty prospect of the office of clerk to the magistrates at petty sessions. All on a sudden, however, the attorney was asked by Lord Chief-Justice Parker if he knew of any decent and intelligent person fit to be employed as a sort of law tutor for his sons; and Philip Yorke receiving his master's strong recommendation, removed at once from Brooke Street to Lincoln's Inn Fields. Here he studied something of more consequence than Latin or Greek—namely, English; a study, says Lord Campbell, 'generally so much neglected by English lawyers, that many of the most eminent of them will be found in their written "opinions" violating the rules of grammar, and without the least remorse constructing their sentences in a slovenly manner, for which a schoolboy would be whipped.' At that time Addison's Spectator was coming out in numbers; and Philip was so well satisfied with his progress in English, that he would needs try a paper. And, what is more, that paper actually appeared, and proved distinctly—although it proved nothing more—that the author had learned to write his mother tongue.

But Philip Yorke was not cut out for an author: and he knew it. He attended the courts closely, revising and digesting his notes in the evening; and with actual practice in prospect, he took care to study elocution and oratory. He was at length called to the bar in his twenty-third year; and enjoying, as he did, the good opinion of his former master the attorney, and of his present patron Chief-Justice Parker, and recommended to all who knew him by uniform good conduct, it is not very surprising that he should have met with immediate success. Still, many people were surprised; and on one occasion at a circuit dinner, Mr Justice Powis, addressing the flourishing junior, who was sitting nearly opposite to him, said, 'Mr Yorke, I cannot well account for your having so much business, considering how short a time you have been at the bar; I humbly conceive you must have published something; for, look you, do you see, there is scarcely a cause before the court but you are employed in it, on one side or other. I should therefore be glad to know, Mr Yorke, do you see, whether this is the case?' Yorke. 'Please ye, my lord, I have some thoughts of publishing a book, but as yet I have made no progress in it.' The judge, smiling to think that his conjecture was not quite without foundation, became importunate to know the subject of the book; and Yorke, not being able to evade his inquiries, at last said, 'I have had thoughts, my lord, of doing Coke upon Littleton into verse; but I have gone a very little way into it.' Powis. 'This is something new, and must be very entertaining; and I beg you will

oblige us with a recital of a few of the verses." Mr Yorke long resisted; but finding that the judge would not drop the subject, bethought himself that he could not get rid of it better than by compounding a specimen of such a translation, and accordingly recited the following verses, as the opening of his proposed work:—

"He that holdeth his lands in fee,
Need neither to quake nor to quiver,
I humbly conceive: for look, do you see,
They are his and his heirs for ever."

'The learned judge took this for a serious attempt to impress upon the youthful mind the great truths of tenures, and meeting Mr Yorke a few months afterwards in Westminster Hall, he inquired "how he was getting on with the translation of Littleton?"

Philip Yorke now determined to marry, and in his choice of a wife he exhibited his usual prudence. He married a widow, with a good temper and a good jointure, and never had reason to regret it, though they both lived to a good old age.

In 1718, Chief-Justice Parker (afterwards Lord Macclesfield) became the lord chancellor, and Mr Yorke transferred himself to the Court of Chancery, where his patron distinguished him by a partiality, which some suppose was the cause of the enmity that eventually precipitated his own downfall. Yorke, however, proceeded on his usual plan—that is to say, he studied hard. He did not take things as he found them, but made it his business to understand the origin, history, and nature of the jurisdiction he had now to deal with. All this had its usual effect. Lord Macclesfield prevailed upon the Duke of Newcastle to send his protégé into parliament. Yorke may have felt elated, but he did not show it. He entered the House of Commons; and no special occasion offering for a speech, he sat there for several months, and then went on the Spring Circuit, without having opened his lips. At this time some personal squabbles that had been going on between the two great law officers of the crown, the solicitor-general and attorney-general, became so odious, that one of them was turned about his business. What was this to Yorke? The following letter, which he received upon attending the assizes at Dorchester, will show:—

SIR—The king having declared it to be his pleasure that you be his solicitor-general in the room of Sir William Thompson, who is already removed from the office, I with great pleasure obey his majesty's commands, to require you to hasten to town immediately upon receipt hereof, in order to take that office upon you. I heartily congratulate you upon this first instance of his majesty's favour, and am with great sincerity, sir, your faithful and obedient servant,

PARKER, C.

When presented to the king on his taking office, he received the honour of knighthood.

This happened when he was only twenty-nine years of age, and when he had been practising at the bar only four years; and the consequence of course was abundance of envy, hatred, malice, and all uncharitableness. But he disarmed enmity by the gentleness of his manner, and commanded confidence by his solid talents and unwearied industry.

In three years Sir Philip Yorke was promoted to be attorney-general; and in two years more came the impeachment of his patron, Lord Macclesfield, who was denounced as 'a trafficker in judicial affairs, and a robber of widows and orphans.' On this occasion the *parsons* begged to be left out of the conduct of the prosecution, and obtained his request with difficulty; but that appears to be the utmost extent to which his prudence permitted his gratitude to go. On the fall of Lord Macclesfield, he attached himself devoutly to the Duke of Newcastle, 'who was hardly gifted with common understanding, and did not possess the knowledge of geography and history now acquired at a parish school.' In 1733, Sir Philip Yorke was made Chief-Justice of the Court of King's Bench, and elevated to the peerage by the title of Baron Hardwicke; and in

five years after, Lord Talbot dying suddenly, the attorney's *gratis clerk* became the Lord High Chancellor of England.

This wonderful fortune was not the result of natural genius and occasional exertion, but of steady, well-directed, and persevering industry, assisted by gentle, not to say insinuating manners, and a propriety of conduct and moral bearing, on which it has never been attempted to throw the slightest stigma. As chancellor, 'he in a few years raised a reputation which no one presiding in the Court of Chancery has ever enjoyed, and which was not exceeded by that of the great Lord Mansfield as a common law judge. The wisdom of his decrees was the theme of universal eulogy. Such confidence was there in his administration of justice, that the business of the court was greatly increased; and it is said that more bills were filed under him than at any subsequent time, although the property administered by the Court of Chancery has since been increased sevenfold. There were still rare complaints of delays in Chancery, from the intricate nature of the inquiries, the death of parties, and other inevitable obstructions to the final winding up of a suit, but by great exertion, arrears were kept down, "and this is fondly looked back upon as the golden age of equity."

In 1754 he was created Earl of Hardwicke and Viscount Royston. This honour was desired by himself, but delayed as long as possible by his wife, from a fear of the effect it might have on the mind and manners of their two daughters. Two years after this he resigned the great seal into the king's hands, who received it from him with many expressions of regret and respect; and in 1764, in the seventy-fourth year of his age, after having accumulated an immense fortune, and magnificently provided for all his relations and dependants, he submitted to the common lot of mortality with the forethought and deliberation which distinguished his character.

The materials for the above sketch are collected from the recently-published fifth volume of Lord Campbell's 'Lives of the Lord Chancellors.' We look upon this memoir to be one of the most usefully suggestive in the series; and we throw it into the present form, in order to fix the reader's attention upon the facts of the 'strange eventful history,' undisturbed by the episodes and reflections of biography.

EFFORTS AT SOCIAL IMPROVEMENT.

SCARCELY a day elapses in which we do not receive one or more documents connected with social progress. It would appear that, all over the country, in small as well as in large towns, efforts are making to establish and sustain institutions calculated to improve the mental condition of the people. In very many instances, these efforts make little or no newspaper appearance. Plans are matured quietly, and carried into execution unobtrusively. So far as we can observe, a number of the institutions thus originating are professedly for mutual improvement. The principle of employing hired lecturers succeeds only in connection with large establishments: where only a handful of persons are concerned, with little money to spare, the members are necessarily driven on their own capabilities—those who have a little more knowledge than the others volunteering to act as instructors. We are hopeful that plans of this kind will answer every reasonable purpose. In every locality there are persons who possess sufficient ability to become the advisers and teachers of others.

A library is the point round which the members of such institutions rally. An improvement society without a library of some kind, would be like a system without a sun. Fortunately, a library is not difficult to commence; and when once begun, it is surprising how soon a collection of books swells into importance. A mutual improvement society lately begun by a few ploughmen in Aberdeenshire, has already, we are told, a pretty fair collection of books, and is otherwise doing

well. And it could scarcely fail to do so. All that is wanted is a little energy, in union with a little common sense, and any dozen of rural labourers may instruct themselves in a manner which would not discredit much higher circles. The value of a small library of miscellaneous literature in a country district—say no more than a hundred volumes, mostly of a cheap class—cannot be too highly estimated. Vacant hours in the evening, formerly spent in listless idleness, or degrading amusements, are devoted to reading, and by and by a sensible improvement in the morals of the neighbourhood is effected. A few days ago, when visiting the house of a parish clergyman in a mountainous, though agricultural district of Scotland, he mentioned that a remarkable change for the better had taken place in the morals of the neighbourhood within the last twelve months, in consequence of a small library which he had set on foot. Among the population, young and old, there was already created an eager thirst for reading, which unconsciously banished tastes and habits of a meaner kind.

On our way to the above district, we had occasion to pass through a small county town, where a reading-room on a peculiar plan had been established about a year ago, and was now in a flourishing condition. The way in which this useful engine of instruction had been brought into, and kept in existence, deserves notice. A small committee of management, who assumed the institution and direction of the establishment, procured the use of a public hall gratis; and this apartment was already furnished with a table and forms. Newspapers were supplied from divers individuals, also gratis. Gentlemen at a distance, who take an interest in the undertaking, send London and other papers daily; many papers have come even from America and India, the gift of natives of the town; in short, the quantity of papers which are contributed is immense. On the day of our visit to the room, from forty to fifty different papers—English, Scotch, Irish, Isle of Man, Jersey, British American, United States, Bombay, and Australian—lay on the table; the whole forming quite a feast to the various readers. We were told that the average attendance daily is about fifty persons, most of whom, however, make two or more visits. The only expenses incurred are for one or two newspapers, which it is considered necessary to have regularly and promptly, along with two magazines and a review, at half price. The providing of attendance, and fire in winter, with lights, forms also an unavoidable cause of outlay; but it is confidently expected that the voluntary contributions dropped into a box in the room, and money from the sale of papers, will leave only a trifle to be raised by subscription. Admission is free to all. The whole population are invited to come and read for nothing; and this is a boon of so much value, that one could reasonably have expected to hear of a greater attendance than that above alluded to. The pleasures and advantages of literary recreation, however, are everywhere slowly appreciated. Men accustomed to stand thirty years in the street with their hands in their pockets, do not all at once fall in with the fashion of reading newspapers or monthly periodicals. Everything in the way of mental improvement requires time; and perhaps, after all, little is to be expected from the old or middle-aged. The great thing is to prevent the young from forming bad habits; and this, to all appearance, is done by the reading-room which we speak of. As one means of improvement usually leads to another, a library has just been added, which will greatly promote the objects of the institution.

The account of the above reading-room will suggest what may be accomplished in thousands of situations where no place of resort exists, at least for popular improvement. There must be an incalculable number of newspapers, of one kind or other, wasted after being read. Why should a single paper be destroyed, while there are millions of people mentally famished for want of any accessible literature? Every news-

paper bears a stamp, and this gives it wings to fly over the whole country. Without expense, and with no other trouble than the tying of a piece of string, and the writing of a name, off it will go to any part of the United Kingdom, even to the obscurest hamlet. Hack-nied and useless though it seem to the sender, with what delight is it received at its destination! A 'Times,' read and tossed aside in a London counting-room, is new to the inhabitants of a village hundreds of miles distant, and is read with an avidity greater than that with which it was received wet from the press. We would, then, endeavour to press on all persons who have used newspapers at disposal, the propriety and benevolence of despatching them to parties who are not in the way of seeing them. Little recommendation, however, will be necessary. Most people would be glad to find an outlet for what becomes a nuisance in their parlours. What we must incite people to do, is to get up reading-rooms in various parts of large towns, and also in small towns and villages, to which used papers could be gratuitously sent. Let the directors of these institutions make known their wants to all who are likely to assist them—natives of small towns living in cities or abroad not to be forgotten—and there can be little doubt of their success.

We have seldom heard of a body of artisans doing anything more likely to be useful to themselves than that which has just been undertaken by the operative printers of Newcastle-on-Tyne. These individuals have organised themselves into a society, to be called the Newcastle and Gateshead Typographical Mutual Improvement Society; the object being the improvement of the profession generally, but more particularly in reference to the training of youth in a knowledge of the rise and progress of the art of printing, as well as to imbue them with a spirit of emulation to become more proficient workmen, to promote a better general knowledge of all matters appertaining to the trade, and to cultivate the moral, intellectual, and social well-being of all parties connected with it. The ordinary members of the institution are to consist of journeymen printers and apprentices; honorary members are to be employers, and others connected with the press, and donors of books or money. Besides addresses on the history and peculiarities of the art of printing, likely to improve the professional taste, lectures are to be delivered on generally scientific subjects. A library is formed for reference and instruction.

Every one must wish well to a scheme fraught with so much benefit to the parties interested. As soon as the prospectus of the society came under our notice, we felt that such an association was needed, and we should be glad to hear that it was imitated in Edinburgh and other cities. According to existing arrangements, apprentices receive only technical instruction in the particular department to which they are put. They never hear a word of general principles; they may grow up in ignorance of every interesting fact connected with their profession; and even as journeymen, they may be deficient in a knowledge of nice peculiarities in the art, which an improvement of taste would suggest. The scheming of handsome titles, of neatly-shaped pages in reference to size of type, and similar matters, form exceedingly suitable themes for general and mutual instruction among compositors. As to pressmen, how few are able to distinguish niceties in colour! In printing a book, one sheet will be made pale and another dark, by which general uniformity in the volume is destroyed. Among the high-skilled pressmen of London a better knowledge prevails; but rarely have we seen proficiency in this respect in any provincial printing. It is this defect alone—a defect arising entirely from want of care and taste—that keeps provincial typography inferior to that of London. To this imperfection, and also to a general ignorance in the art of printing wood-engravings, we beg to direct the attention of the Newcastle Society. We cannot conclude our notice without expressing a hope that other operatives

besides printers may see the importance of associating for professional improvement.

Of the value of, and necessity for, mechanics' institutions, as respects general elementary instruction, we have a striking testimony in the report just published of the Mechanics' Institution of Huddersfield. This useful establishment is attended by 778 students, pretty nearly all of whom are operatives, or lads belonging to factories. The great business of the institution seems to be the conducting of classes; but there are, besides, a library, to which 500 members resort, a reading-room, weekly lectures, and an annual *soirée*; the members generally enjoy likewise an annual cheap trip by railway, on which occasion there are some festivities. The main thing, however, as we have said, are the classes, which are held in the evening; nor, from the account before us, are these means of improvement unnecessary. What a revelation of the illiterate condition of a busy manufacturing town in England, is afforded in the following candid statement:—

'The education of the working-classes in the town and neighbourhood has always been kept steadily in view by the committee, as the first and most important object of their high trust; and the large extent to which their exertions and appeals in this direction have been responded to by the working-classes, is regarded as an augury of much practical good, and of true success for the future. Whilst the committee, however, are rejoiced at the regular and frequent attendance of a large portion of the members, they cannot but regret that so many uneducated young men who enter the classes are deterred from continuing in them on account of the difficulties which beset them at the commencement, and who leave them in utter despair of achieving the mastery of the commonest rudiments of learning. There are the names of a large number of such men on the books, who, after paying for the first fortnight in advance, never appear again in the financial columns. These persons, in passing through the probationary class, where they are examined by the secretary, are for the most part totally deficient even in elementary knowledge, and many of them are unable either to read or write. Their average age is from eighteen to twenty-five. The committee, fully alive to the necessities of this class, have long ago provided separate teachers in the reading department to meet the emergency, and apportioned a separate room for their exclusive use during the hours of their meeting; and there are other elementary classes, from simple addition to the compound rules in arithmetic, and like elementary classes for writing. Notwithstanding all this, however, there are some men who, conscious of their deficiency, and of the insurmountable hindrance which ignorance presents to all the advancements and noble immunities of life, cannot be persuaded to devote themselves to a necessary culture. And whilst the committee would sympathise with their unhappy condition, and regret the hard circumstances which may have operated against their education in early life, yet still they feel that they should scarcely be discharging their duty, if they did not offer them a word of friendly and faithful admonition. They would say—You have never given a fair trial of your own strength against the armed power of knowledge. You have given up the contest the moment you entered the lists, without so much as meeting your antagonist, and defying him to the hazard of a battle. This is neither brave nor manly. Who gave knowledge the immense power she possesses, and armed her with those swords of flaming fire which terrify you so much? It was the mind and industry of man. And are not you also a man—having the same average faculties of all other men? What one man can do, another man—and, generally speaking, all men—can accomplish. It is the will, and not the capacity, which is so frequently wanting in the fight for learning; and the experience of the committee in connexion with the working-classes will justify them in saying, that few amongst them who have the will lack the power to learn, and that num-

bers of them, even in our own institution, are capable of advancing to the regions of the higher culture. Let no man, therefore, be abashed by difficulties. If he once stir himself under them, they will, as they have ever done, vanish away, and leave him free to advance onward. "Who art thou that saith there is a lion in the way? Rise, sluggard, and slay the lion! The road has to be travelled."

The classes for arithmetic, writing, grammar, and logic, design, ornamental and mechanical drawing, elocution, music, French, German, geography, and history, are reported to be all doing useful service. An institution performing so much good has our best wishes.

An attempt at another species of improvement in the condition of operative bodies is now making in different parts of England. This consists in clubbing means to purchase articles at wholesale prices, with a view to distribution among members. Thus we see proposals to establish a co-operative corn-mill, a co-operative baking establishment, the co-operative purchase of groceries, and so on. No one can find any fault with these arrangements. The higher classes club for various purposes, why should not mechanics? Considering the immense sum in the aggregate paid as wages to the operative classes—as, for example, the large sum which is distributed weekly in Glasgow or Manchester—it has always appeared to us a remarkable thing that there was so little clubbing of means for economic objects. We fear that a too common cause of the phenomenon is the want of a general knowledge of business among the working-classes, also a want of settled purpose or steadiness, and perhaps a want of confidence in each other. Having often experienced the deceitfulness of persons who pushed themselves forward to act as managers and treasurers, they may well dread a recurrence of financial disaster.

In 'The Herald of Co-operation,' a paper which appears to be the organ of co-operative principles, allusion is made to a plan for bettering the condition of the working-classes, described by us a year or two ago in connexion with the proceedings of a Parisian house-painter. This plan consists in workmen having a pecuniary interest in the establishment to which they are attached. Instead of depending altogether on wages, they receive a share of the profits, much on the principle pursued in the pastoral regions of Scotland, where the shepherds are paid partly by the profits derived from sheep, their own property, which mingle with the flocks of their employer. We can conceive that plans of this kind might answer every desirable purpose in various professions, though, according to the existing laws of partnership in England, it would be difficult, perhaps impossible, to carry them into execution. We are less sanguine of the success of schemes of co-operation in trade, where the partners are all to be manual labourers with a portion of capital. In a ready-money business, as in selling bread, the obstacles to success are insignificant; but when we come to extensive concerns, where capital must be expended and returns waited for, in some cases for years, the chances are greatly against the project turning out satisfactorily. In the article treating on this subject in the above paper, no allowance is made for possible losses or delays in paying debts. This is a matter, however, which requires serious consideration. In the conducting of most businesses, profits are slowly realised, quickly as they may appear to be effected. A tradesman, on making up a balance-sheet at the end of a year, perhaps finds that he has made £500 of profit during the past twelve months; but that, strangely enough, he cannot take more than £10 or £20 of cash from the concern. The profits are all in figures—so much for debts owing to him, and so much for accumulated stock. Debts, if not bad, come in of course in time; but the tendency to an increase of stock is a terrible drawback on money returns. The stock may be in goods, or mechanism wherewith to carry on the trade; but in any form, it is equally obstructive of the principle of taking and dividing money

profits periodically. It is from this cause that so many persons in trade are ruined by *paying out* partners. The bulk of the assets being in stock, the proportion belonging to a retiring partner needs to be paid in cash; and the struggle to carry on business after paying this cash, which is effected by entering into serious obligations, often leads to bankruptcy. It is quite possible to become insolvent, and yet possess assets nominally worth more than would pay every one twenty shillings a-pound.

All this we mention in a friendly way to bodies of working-men who feel inclined to attempt co-operative trading. The subject is one of great difficulty, not only in consequence of its novelty, but the state of the law, and other circumstances. Our belief, on the whole, is, that operatives, as a class, are not prepared to enter on projects involving a considerable amount of capital, enterprise, and risk. But there is no reason why they should not prepare themselves for taking advantage of any reasonable scheme of this nature which may be by and by offered. With this end, it is desirable in the meanwhile that three things should be steadily kept in view, and upon this there can be no mistake. Every man proposing to rise out of his sphere requires, first, to possess the general instruction and intelligence which would adapt him for performing the function of a partner; second, he requires to save and accumulate a certain amount of capital, the whole of which he must be prepared to peril or lie out of for a time; and third, he requires to train himself in those habits of self-denial which would insure his conservation of whatever advantages fell to his share. All working-men who possess these three requisites are ready to become partners in a co-operative trading system; and if their plans be well matured, we wish them speed. Those who do not—and we fear the bulk of the operative body are in this condition—must wait. Self-culture, economy, steadiness—how much is kept back in the social world in consequence of your lingering delays!

A TRIP ACROSS THE ISTHMUS OF DARIEN.

I was attached to a ten-gun brig, on the West India station, when we were ordered to Chagre with despatches for Panama. Chagre was a miserable, dirty village, which, however, derived some importance from being at that time the starting-place from the Atlantic to Panama, and also the port at which specie and goods from Panama, destined for England *via* the West Indies, were embarked.

The despatches with which we were charged were not only important, but urgent; and being out of the regular course of the mail, we could find no courier at Chagre to convey them to Panama; and as I had a great desire to cross the isthmus, I volunteered my services as courier, and made arrangements for starting on the following morning. Fortunately I found at Chagre a merchant who was also desirous to cross. He was an exceedingly pleasant Scotchman, who had been to Panama several times, and spoke the 'Columbian Spanish' like a native.

We engaged a large canoe, the after-part of which was covered by a caravan-roof, composed of wicker-work and stout grass mats. This formed an excellent defence from the sun by day and the heavy dew by night; and had it not been for the mosquitoes, which invaded our snuggerly like an army of trumpeters, singing in our ears, and stinging us right and left, we should have been comfortable enough. As it was, we smoked, to endeavour to choke them; and by laughing at our troubles, we made them lighter. In truth we had great need of all our philosophy, for the current ran so strong, that the four stout Indians who composed our boat's crew were obliged to abandon the paddle, and pole up the river the whole distance of sixty miles; consequently it was not until the afternoon of the third day that we landed to refresh ourselves on the bank, a few miles below the point where the part of the journey by water terminates. Thus far the journey had been exceed-

ingly monotonous and tedious; the only amusement being an occasional shot either at birds—which, if they fell, were lost in the woods, growing in wild luxuriance to the water's edge—or at a lazy alligator basking in the sun on a bank of mud, and which, if the ball struck his impervious hide, rolled over and over like a log, till he sunk beneath the stream and disappeared. The heat by day was intense; for although the river is very deep, it is very narrow, and so choked with foliage on both sides, that a breath of agitated air is an unknown luxury. Then, although the heights were cooler, it was impossible to meet with a vacant spot to take exercise; and it may be imagined that three days and two nights of such purgatory was irksome in the extreme.

The spot where our canoe was now hauled up on the muddy bank commanded a beautiful view, considering it was in a wilderness, and flat. On the opposite side of the river nature had formed for herself a perfect park; the velvet lawns sloped and undulated as if they had been laid out by elaborate art, whilst the majestic trees, centuries old, 'now singly stood, and now in groups,' and it only required a stretch of fancy to picture an old baronial hall in the distance, to transport one in imagination from a wilderness where possibly the foot of man had never trodden, to a country-seat in dear old England; so true is it that all the beautiful designs of art may be traced to nature for their model.

It was during our rest at this place that I nearly lost 'the number of my mess;' the Indians were busied making a fire of dried sticks to roast a guana I had shot, and I determined to take advantage of their absence from the canoe to make my toilette. I was leaning over the side of the boat, bathing my head in the rapid stream, when the canoe suddenly tilted with my weight upon her gunwale, and losing my equilibrium, I plunged headlong into the river. How wonderful is the flight of thought! I could not have been more than a few seconds under water, and yet in that brief space I recollected not only that alligators were abundant, but that, about a fortnight before, a brave officer had lost his life by falling into this same river, and getting, as was supposed, into a strong under-current, was hurried away by it, and unable to rise to the surface. What an age it seemed before I shook my head above the water; and when I did so, I found the stream had already swept me a considerable distance from the canoe, and more into the middle of the current. 'Courage!' shouted the captain of the boat's crew.

'Are there any alligators?' I cried.

'Oh no,' said he, laughing encouragingly; and in a few minutes I reached the bank, and, by a desperate effort, threw myself on a bed of mud, from which I emerged darker in hue than our sable boatmen.

At about nine in the evening we arrived at Cruces, the place where the water-carriage ceases; and proceeding to the 'head inn,' I pleased myself with visions of a good dinner, and a refreshing night's rest, preparatory to the ride of thirty miles onward to Panama on the day following. Alas that our waking visions should so often prove no less illusory than our dreams of the night!

The head inn was not a dwelling for either feasting or repose: the room into which I was shown to rest for the night was furnished with two grass hammocks, suspended from the rafters, and exactly resembled a large net made from the tough variegated grasses of South America, the meshes being about the size, and the network about the strength and substance, of an ordinary cabbage-net. I stretched myself in one of these, and had just begun to enter the realms of Somnus, when I was startled by the shrill crowing of a cock within a yard of my ear. This was followed by another, and another crow, and anon half-a-dozen throats were screaming defiance at one and the same moment. The noise in so confined a place was absolutely painful, and jumping out of the hammock, I discovered that there were eight fighting cocks, each tied by the leg,

in the four corners, and in the centre of the four sides of the room. We cannot afford to be very particular on board ship as to noise, and by long habit, we sleep through the scrubbing decks, or the tramp of a hundred men immediately overhead; indeed I have known a man sleep undisturbed by a salute of cannon fired on the deck above him: but the screaming of eight fighting cocks, with the accompaniment of flapping of wings, and struggling to free themselves, was beyond even a sailor's powers of somnolency, and I rushed into the open air in despair.

I may remark that the love of cock-fighting amongst the Creole Spaniards amounts to a passion. At Santa Martha, and Carthagena, and other places, I have seen heavy sums change hands at cock-fights; and judging from the living ornaments of my sleeping apartment, the passion for this species of amusement must have been equally strong at Cruces.

As soon as I found my friend the merchant, he very kindly acceded to my desire to proceed to Panama that night. It having become known that we intended to cross, four or five Spanish travellers requested to join us; and after some delay in procuring mules and a guide, our cavalcade left the head inn, and took the road to Panama.

It was a lovely night; the full moon literally flooded the landscape with her splendour; but after riding about a mile from Cruces, we entered upon the actual road, and there the trees, and banks, and excavated rocks on either side so perfectly excluded the moon's rays, that it was impossible to see the road, which was in a most ruinous state, never having been repaired since it was first made by the Spaniards some fifty years before. At one moment the mule was stumbling over a heap of stones, which the torrent of the rainy season had piled together; and the next, he plunged into the hole from which they had been dislodged. Of course our progress was very slow, and at seven o'clock in the morning we were still ten miles from Panama, having been eight hours travelling the twenty miles from Cruces.

As the road up to this time had been almost one continued lane, running between banks more or less steep, I considered there could be no danger of missing the party if I dismounted to refresh myself, by bathing my face in a clear brook which rippled across the road. I was rather behind the rest, and my stopping was not observed by any one, for all were jaded and silent with the tedious and laborious journey of the night. Having finished my ablutions, I endeavoured to push on to overtake the cavalcade; and although I could not see any of them, I concluded that it was simply some turn of the road which concealed them from my sight. The beast I rode, however, was either knocked up, or had never been accustomed to any pace faster than a walk. In vain I coaxed or flogged him; flagellation seemed rather to retard than accelerate his movements: in vain I struck the spurs, with rowsels the size of penny-pieces, into his ribs; I might as well have spurred a rhinoceros, for out of a deliberate walk he would not move. After travelling about a mile in this way, I came to a large open plain nearly surrounded by a wood. I looked in all directions, but could discover no trace, not even the print of a hoof, from which I might judge which way my companions had gone. But as the sagacity of the mule is by some wise man said to be equal to his obstinacy, I threw the reins upon the neck of mine, and suffered him to 'go his own way;' and he, crossing the plain in a straight line, entered the wood. At first the trees were so thick, and the branches so interwoven, that it was difficult to force a passage; but after a while the wood became more open, and having proceeded so far as to have lost all chance of finding the way out again, the mule suddenly stopped on the brink of a very extensive marsh, muddy and overgrown with rushes. The spot upon which he stood was clear, and the grass excellently good, to judge by the avidity with which my quadruped attacked it. I dismounted,

and paused for some time, revolving in my mind what was to be done. I was hemmed in by the wood, except where it was bounded by the marsh, and to return to the forest again, would be only to get into a labyrinth from which I might never be able to extricate myself. Therefore I resolved to cross the marsh if possible, and to climb to the top of a mountain I saw in the distance, and from the summit of which I calculated I must see the city of Panama. In execution of this purpose, I loosed from the mule's neck a rope, which is used as a tether when those animals halt to graze on a journey; and fastening one end of it to his neck, and the other round my arm, I *drove* him into the marsh, which no effort of mine could make him enter whilst I remained on his back. The first plunge into the stagnant morass was as deep as my waist, and I had not gone twenty yards, when my feet became so fettered by the rushes, that I lost my balance, and fell at full length. Before I could recover my footing, the mule had turned to the place we had left; and being a large, powerful brute, he dragged me after him like a well-hooked salmon; and in his final bound to regain the bank, the rope broke, and he trotted out of reach, and resumed his breakfast, casting a sly glance at me, as much as to say, 'I hope you are refreshed by your cold bath.'

I now felt in a perfect dilemma; for the valise containing the despatches was strapped behind the saddle, and all my efforts to catch the mule were ineffectual. Whenever I approached, his heels were ready to launch out; and if in desperation I rushed at him, he bounded off with an inconceivable agility and force, until at length I was fairly exhausted; and spreading my cloak upon the grass, I endeavoured to collect my thoughts, and to realise if possible the true nature of my position. In the course of my experience I have been often struck with the difference of the state of mind under the prospect of immediate, and apparently inevitable death, and when the prospect of death is not so immediate, and apparently inevitable. I recollect, for example, being once wrecked; and when, in half an hour after, the vessel struck, she began to fill, and death appeared unavoidable—the boats being either washed away, or destroyed by the falling masts; the water increasing more and more in the hold; and there appearing not a doubt but all hands must perish. On that occasion I found it impracticable to fix my mind for three minutes together—my imagination was so busy catching at straws, that it was impossible to collect my thoughts and meditate soberly; but now, as I lay on the grass in the wild forest, I could deliberately plan, reject, and replan, with the thoughts perfectly under control. Not but the possibility of death crossed my mind; for the want of rest in the canoe, the tedious journey of the night, and lack of any refreshment since the afternoon of the preceding day, made me doubt whether I should be equal to crossing the marsh, climbing the distant mountain, and then walking some ten or a dozen miles to Panama; if even I could contemplate the idea of leaving the valise containing the despatches, on the chance of its being recovered afterwards. This, however, I felt I could never have done. We admire the heroism of the soldier who, when he was picked up dead upon the field, was found to have the colours he had borne stuffed into his bosom; but I believe that the same spirit is very general amongst men accustomed to military life, and subjected to military discipline. '*L'esprit de corps*' is the ruling principle, before which life and all other considerations become secondary. Hence it was that I felt I could not abandon the despatches intrusted to me, whatever else I might do.

I suppose I had lain thus for half an hour, when I was suddenly roused from my reverie by an exclamation of surprise, and a man's voice demanding who I was, and what had brought me there? I started to my feet, and before me sat, on a stout Spanish pony, a muleteer. I soon made him understand my position, when, in an incredibly short time, he secured my mule, shifted my saddle on to his own pony, being, as he

politely said, the more pleasant animal of the two for me to ride, and mounting the mule himself—which, by the way, appeared perfectly to comprehend the difference between his present and his late rider—he led the way through the mazy intricacies of the wood, and brought me out on the Panama road, at the distance of about three leagues from the city.

The honest muleteer explained to me, as we rode along, that the situation in which he had found me was one of great peril; for, independently of there being no habitation but his own, which was several miles distant, near to the wood, he said I might have remained in the forest for ever, and no one would ever have thought of seeking for me there; and indeed this was confirmed, for as we approached the city, we met several persons on horseback, who had been sent out in search of me; but they declared that they would not have ventured to enter the wood, for fear of the hanging snakes with which it was said to be infested. My deliverer, it appeared, was a breeder of mules; one of which animals having strayed the night before, he thought it was just possible it might have entered the wood, and in seeking for his lost mule he fortunately discovered me.

There is nothing particularly imposing or striking in the appearance of Panama, as approached by the Cruces road. The country is flat, and uncultivated, and the city resembles most other cities built by the Spaniards in those countries—large, heavy-looking houses, built of stone, without any attempt at architectural ornament; but there is an esplanade, upon which the beautiful brunettes promenade, the head uncovered, and the jetty hair, floating in rich, unconfined luxuriance, save where the wearer prefers the braid; and then it hangs in three or more pendants, which often nearly brush the tiny feet, clothed in their satin shoes.

The city of Panama is a comparative wreck of what it must once have been, but the magnificent bay is alone worth travelling across the isthmus to see. The sea almost always maintains its name of 'Pacific,' and looks like a gigantic parterre; whilst the numerous islands with which the bay is studded resembles so many flower-beds—ever blooming, ever lovely. I will not take the reader with me to visit some of these gems of the ocean, nor will I detain him to inspect with me the process of making the curious gold chains for which Panama is celebrated, and many other curious things I saw; but merely add, that after ten days' residence, I left the city at peep of day, and the following afternoon was on board my ship, having bathed in the two seas within forty-eight hours.

THE POOR RELATIONS OF KINGS.

ONE morning during the last severe winter in Paris, a bier, on which was laid a wretched coffin, emerged from one of the poorest streets of the faubourg St Marceau, followed by two assistants, and a female, whose sole protection against the heavy snow that fell was a woollen shawl, partially concealing features once beautiful, though now changed by suffering and privation, yet still beaming with resignation.

The young man whose remains were thus borne to the common cemetery was one whose forefathers slept in the vaults of St Denis, and who, by birth, was entitled to wear the arms of the Bourbon family. In speaking of Henry II., or any other of the kings of France, there was no fiction in this unfortunate being, while living, calling them 'my ancestors.' According to the etiquette of courts, he had a right to be called by the king 'my cousin'; and equally so, by right of consanguinity, by the Bourbons of Spain, and the imperial House of Austria.

Charles de Valois de St Remy was, however, but a poor journeyman bookbinder, employed by one of the many of that trade who struggle for an existence in the neighbourhood of the College of France. Even with the assistance of his aunt, Marguerite de Valois, he scarcely earned enough to subsist on. Like many

others, when placed in situations little in accordance with their birth, Charles de Valois had acquired notions respecting the greatness of his ancestors which unfitted him for steadily pursuing his avocations. Devoid of that energy which is the basis of all self-advancement, he would remain for hours pondering on his ignoble fate. 'One path lies open to me!' he would sometimes exclaim; 'I shall become a soldier, and face the enemies of France!' In these reveries he was no longer the humble artisan, but in imagination one of the noble of his race, regaining all the territory his ancestors had lost. To put these dreams into execution, however, one thing was wanting—Charles de Valois had not the heart of a Bothwell.

Henry II., of whom he was a lineal descendant, had a son, to whom he bequeathed large territories—the most considerable being that of St Remy; but his descendants gradually decreased in power and wealth, and at length they sunk into such obscurity, that their existence was almost doubted. A ray of sunshine would at times gleam on some member of their family, but, as if a fatality hung over their race, it was succeeded by darker shadows.

During the reign of Louis XV., the Marchioness Baulanvilliers, wife of the Prévôt of Merchants, one day passing between Rheims and Fontette, remarked a little girl by the road-side tending a cow, and, pleased with the pretty countenance and figure of the child, called her to the door of the carriage, and offered her a piece of money. The young Jeanne de Valois spurned the proffered coin with the pride of a Spanish hidalgo; and erecting her little person, she recounted to the marchioness her full genealogy—the only thing, besides her paternoster, she had ever learned. On being questioned, she gave sufficient proof of the truth of what she stated; and her listener, estimating nothing more than high birth, though she herself was but the daughter of a revenue officer, made the little cowherd get into the carriage, which rolled off to Paris.

After having had her educated by the first masters, her protectress introduced her to the fashionable world, and even at court, where she was looked on as a sort of curiosity. She was pensioned by the king, and afterwards married the Count de la Motte. The queen, Marie Antoinette, took her into favour, and employed her near her person; but she repaid the royal kindness by the deepest ingratitude. By forging her majesty's signature, she procured large sums of money; and by the same means prevailed on Cardinal Rohan (who was at the time in disgrace at court, and glad of the opportunity of regaining favour) to purchase a necklace, as if for the queen, worth nearly two million francs, for the payment of which the countess alleged that her majesty would give a note in her own handwriting, to be defrayed from the private purse. The necklace was given into the hands of the countess, who immediately sent her husband to London with it. But the period for payment being allowed to pass, the jeweller made his complaint to the queen: Cardinal Rohan, and many others arrested on suspicion, were thrown into the Bastille, but were ultimately released on the real culprit being discovered. The countess was publicly whipped, and branded on the shoulders; a sentence of imprisonment for life was recorded against her; but after ten months' confinement, she effected her escape, and died in London in 1791.

Residing at Troyes, in Champagne, was an uncle of Jeanne de Valois, and looked on as the head of her branch of the family. In a thoroughfare of that town might be heard, from morning until night, the noise of his hammer, accompanied by merry songs, issuing from a frail wooden edifice, erected against the walls of the bishop's garden, and under the shadow of the cathedral clock. Though aware of his genealogy, learned from his father, who died in the Hôtel Dieu at Paris in 1759, it had inspired him neither with pride nor regret—looking on human grandeur, as he did, with the most philosophic indifference. Having never bestowed a thought on claiming the rights of his birth, he worked,

asleep, and sang, and appeared so really contented and happy, that one would have been inclined to believe, according to the old adage, 'that the king was not his cousin.' This gaiety was not without merit, if it is recollected that Henry de Valois, issuing from the reigning family of France, was a cobbler.

In 1778, while the countess was in favour at court, a detachment of the guards, after accompanying the queen to Chateau Vilain, received directions to return through Troyes, and pay their respects to the illustrious artisan, who had been already spoken of at Versailles as one of the remaining representatives of the branch of Francis I., along with the little cowherd of Fontette. As the guards approached the shed, over which a board was fixed, with a boot painted in black, and the words, '*Henri, réparateur de la chaussure humaine!*' ('Henry, shoe-mender to the human race!') they heard a manly voice singing a provincial ditty, while a hammer beat time to the measure. The soldiers, dressed in splendid uniform, advanced respectfully, their hats off, preceded by their lieutenant, the Marquis de Nantouillet. The cobbler, little accustomed to such visitors, regarded them with surprise; but his looks being mechanically directed to the officer's feet, and perceiving his splendid boots, laced with brilliants, he remarked—'You are in error, monsieur; I mend only shoes. Ask for Christophe, the first street on the right.'

The marquis, with many forced compliments, having explained the cause of his presence, the cobbler, lifting his cotton cap from his head, cleared a cumbrous bench of three or four pair of old boots, and made a sign to the officer to be seated: the other soldiers not being able to find room, had the felicity of contemplating his august visage through some tattered sheets of paper, substituted in the window for glass.

'The king has learned, monsieur,' said the marquis, as he accepted the seat, 'that you are in a position little becoming your illustrious origin, and his wish is to change this state of things. Your niece is already a convincing proof of the royal solicitude.'

'And I have many doubts,' replied the old cobbler, 'whether this royal solicitude will much benefit the girl. As for me, monsieur, I am aware that if Henry II. had wished, he could have converted this bench that I sit on into a throne, this hammer into a sceptre, and that instead of this cotton cap, I might wear a brilliant head-gear of gold and diamonds, though much more weighty.'

The marquis was somewhat startled at this liberty of language, but concealing his astonishment under a courtly smile, the cobbler continued—'Eh, well, monsieur, I have no regret at seeing our cousin of Bourbon arrive at the crown of France. Think you that I envy Louis XV.? Not I. I am my own master; no person has an interest in deceiving me; all the world are contented with me, and I with them. Can the king say so much? This reminds me that my work presses—will you permit me?' And the old man, who seemed to take delight in treating without ceremony the king of France and his envoy, busily resumed his employment.

'You had better reflect,' remarked the officer.

'I have no need of reflection; I require nothing.'

'But you have children, monsieur; accept for them what you refuse for yourself, and allow your sons to fill that rank to which they are entitled.'

The old man scratched his ear, as if undecided how to act; at length, pulling his cap over his gray locks, he replied, 'It is my frank opinion, monsieur, that the boys will not reflect very much honour on the family; but that is their affair; so, in their name, I shall accept the king's generosity. The old proverb says that "it is needless to upset good sauce with the foot." But perhaps you could not guess what are my thoughts?' continued Henry de Valois in a tone of raillery. 'I think the king is about doing what I do daily—to patch an old boot, which never lasts long!'

'Very good! very good!' exclaimed the courtier, laughing boisterously. 'Permit me, however, to finish

the simile,' added he: 'I am sure the king's work will be solid. I shall now retire, and inform his majesty of your intentions.'

The visitors had scarcely disappeared, when the old man resumed his song, a proof that the perspective of grandeur did not much trouble the mind of the cobbler, who has been so well described in the songs of Beranger.

A short time afterwards, heedless of the sarcasms and repartees which it occasioned, the king pensioned Henry de Valois from the privy purse, and made him a count. His sons entered the service. One of them was created Baron St Remy, and became captain of a corvette; but, as had been predicted by the old cobbler, none of them added much to the honour of the family. The affair of the necklace threw a sinister éclat upon the name of Valois, and their relationship to the Countess de la Motte hastened their downfall. Abject misery succeeded the perpetration of the crime. The Revolution arrived, and the descendants of Henry II. sank into greater obscurity than that from which they had been taken a few years previously.

The St Remy de Valois had their origin in a royal castle. The splendour of a throne was reflected on their cradle. In three centuries afterwards what is their fate? The last male of their line, struggling with poverty during his lifetime, has his ashes finally consigned to the common city burying place—unknown and forgotten. She who followed his remains was the great-granddaughter of the old cobbler, and the only known survivor of her race.

Our advancement in life depends mainly on our own exertions and energy. Whatever assistance we may derive from others, if without corresponding exertions of our own, is too limited to be of permanent advantage; and the prospects of those on whom kings lavish their favours, like the sun preceding a storm, are never more uncertain than when they appear most dazzling.

Amongst many who stand pre-eminent for self-advancement, may be mentioned Amyot, Vincent de Paul, and Sextus V. The one, picked up dying on the public road, became archbishop of Sens, and preceptor to the king of France; the other, the son of poor parents, uncertain from day to day of the bread they ate, shows a career of virtue and good actions, and was enabled in his old age to retire in affluence; the third, from being a swineherd, became pope. Colbert, Chevert, Catinat, all owed to themselves the dignities to which they were raised.

Our elevation is but the result and the recompense of persevering industry, and a steady adherence to the path of rectitude and justice. We are all more or less the creatures of circumstance; and fortunes made by honourable pursuits are ever the most durable.

HANGING BRIDGES OF SOUTH AMERICA.

There are two kinds of suspension-bridge common in the mountainous districts of South America—namely, the *punte de sogá* and the *huaro*, which are thus described by Dr Von Tschudi the Peruvian traveller:—The *sogá* bridges are composed of four ropes, made of twisted cow-hide, and about the thickness of a man's arm. The four ropes are connected together by thinner ones of the same material, fastened over them transversely. The whole is covered with branches, straw, and roots of the agave tree. On either side a rope, rather more than two feet above the bridge, serves as a balustrade. The *sogás* are fastened on each bank of the river by piles, or rivetted into the rock. During long-continued rains, these bridges become loose, and require to be tightened; but they are always lower in the middle than at the ends, and when passengers are crossing them, they swing like hammocks. It requires some practice, and a very steady head, to go over the *sogá* bridges unaccompanied by a *puntero* or bridge-guide. However strongly made, they are not durable; for the changeableness of the climate quickly rots the ropes, which are made of untanned leather. They frequently require repairing, and travellers have sometimes no alternative but to wait several days until a bridge is passable, or to make a circuit of twenty or thirty leagues. The *punte de sogá* of Oroya

is fifty yards long and one and a half broad. It is one of the largest in Peru; but the bridge across the Apurimac, in the province of Ayacucho, is nearly twice as long, and it is carried over a much deeper gulf.

The huaro bridge consists of a thick rope, extending over a river or across a rocky chasm. To this rope are affixed a roller and a strong piece of wood formed like a yoke, and by means of two smaller ropes, this yoke is drawn along the thick rope which forms the bridge. The passenger who has to cross the huaro is tied to the yoke, and grasps it firmly with both hands. His feet, which are crossed one over the other, rest on the thick rope, and the head is held as erect as possible. All these preliminaries being completed, an Indian, stationed on the opposite side of the river or chasm, draws the passenger across the huaro. This is altogether the most disagreeable and dangerous mode of conveyance that can possibly be conceived. If the rope breaks, an accident of no unfrequent occurrence, the hapless traveller has no chance of escaping with life, for, being fastened, he can make no effort to save himself. Horses and mules are driven by the Indians into the river, and are made to swim across it, in doing which they frequently perish, especially when, being exhausted by a long journey, they have not strength to contend against the force of the current.

MR ADAMS, THE ASTRONOMER.

The 'West Briton' newspaper gives the following interesting snatch respecting the early days of Mr Adams, the co-discoverer of the new planet Neptune:—The traveller who has come into Cornwall by the north road must remember a long moorland tract between Launceston and Bodmin. If his journey was performed on the roof of the coach against a sleety, biting south-wester, his memory will not need any refresher. The recollections of such an excursion are not to be effaced even by the consolations of the Jamaica Inn. A more desolate spot can scarcely be found. Yet nature sometimes grows *men* where she grows nothing else; and on this bleak moor she has produced at least one such man as, with all her tropical magnificence, she never produced within ten degrees of the equator. A few years ago a small farmer named Adams, resident on the moor, had a boy who, if we are correctly informed, disappointed his father's hopes of making a good agriculturist of him. His fits of abstraction and dreamy reverie were held to be very unpropitious. He had somehow got a taste for mathematics; and the highest happiness of his life was to pore over

'Books that explain
The purer elements of truth, involved
In lines and numbers.'

And this passion so grew upon him, that he was at length abandoned to its impulses, and allowed to take his own way, in despair of a better. It was clear that *he* would never pick up prizes at a ploughing-match or a cattle-show; that the lord of the manor, or squire of the parish, would never have to stand up and make a solemn oration over him, showing him to wondering spectators as the man who had improved the breed of rams, or fattened bullocks to a distressing obesity. Yet, as the path to such fame was closed, there were still some small honours awaiting him. After a school training, he entered at St John's College, Cambridge, where, at the end of his under-graduateship, he became senior wrangler. He is now one of the mathematical tutors at that college, and one of the discoverers of the planet Neptune.

A STRANGE ANOMALY.

People will perhaps urge, as an objection to our plans for the improvement of the condition of the houses of the poor, the necessary interference with the rights of property. But is our respect for the rights of property to be carried so far as to endanger the public health and security? The rights of the proprietor are necessarily limited by the rights of society. That limit is inscribed upon nearly every page of our law: Why does it not also exist for the speculator who lets his houses to the workman and indigent? We impose rigorous conditions on the sale of commodities; we confiscate, without hesitation, meat of bad quality, putrid fish, adulterated liquors, and bread below the legal weight; and we not only confiscate these things, but we punish their owners. By what strange contradiction do the proprietors of these hideous dens, these infectious holes—to inhabit which is at least as dangerous as the use of the most unwholesome food—not only remain unpunished, but

continue to enjoy a peculiar protection, and a sort of privilege, inasmuch as they are exempt from the greater part of the conditions imposed upon other proprietors? If we forbid the sale of arsenic, &c. why do we allow a host of wretched beings to famish by slow poison in the unwholesome habitations in which they are necessarily confined?—*Ducpétiaux on the Mortality of Brussels.*

SERENADE.

[FOR MUSIC.]

'Tis now the hour when blushing Day,
Like youthful bride, to rest is stealing;
But coy to go, and loath to stay,
One doubtful smile is yet revealing.
But go, sweet day! I would not woo
Thy stay with one poor verse of mine—
Go, and thy veil of deepening hue
Will hide a brighter blush than thine!

And hark! the twilight minstrel now
Sings to the lonely star of even:
So falls the music, faint and slow,
To youthful fancy's dreaming given!
But hush, sweet bird! I would not buy
Thy lay with one poor verse of mine—
Hush! lest thy murmured minstrelsy
Drown a far sweeter note than thine!

L. R.

PROGRESS.

In the flow of a century the world has changed in science, in arts, in the extent of commerce, in the improvement of navigation, and in all that relates to the civilisation of man. But it is the spirit of human freedom, the new elevation of individual man, in his moral, social, and political character, leading the whole long train of other improvements, which has most remarkably distinguished the era. Society, in this century, has not made its progress, like Chinese skill, by a greater acuteness of ingenuity in trifles; it has not merely lashed itself to an increased speed round the old circles of thought and action; but it has assumed a new character—it has raised itself from *beneath* governments to a participation in governments; it has mixed moral and political objects with the daily pursuits of individual men; and, with a freedom and strength before altogether unknown, it has applied to these objects the whole power of the human understanding. It has been the era, in short, when the social principle has triumphed over the feudal principle; when society has maintained its rights against military power, and established, on foundations never hereafter to be shaken, its competency to govern itself.—*Daniel Webster.*

PHOSPHORESCENT FUNGI.

One dark night, about the beginning of December, while passing along the streets of the Villa de Natividade, I observed some boys amusing themselves with some luminous object, which I at first supposed to be a kind of large fire-fly; but on making inquiry, I found it to be a beautiful phosphorescent fungus, belonging to the genus *Agaricus*, and was told that it grew abundantly in the neighbourhood on the decaying leaves of a dwarf palm. Next day I obtained a great many specimens, and found them to vary from one to two and a-half inches across. The whole plant gives out at night a bright phosphorescent light, of a pale greenish hue, similar to that emitted by the larger fire-flies, or by those curious soft-bodied marine animals, the *Pyrosoma*. From this circumstance, and from growing on a palm, it is called by the inhabitants 'Flor do Coco.' The light given out by a few of these fungi, in a dark room, was sufficient to read by. I was not aware at the time I discovered this fungus that any other species of the same genus exhibited a similar phenomenon; such, however, is the case in the *A. olearius* of De Candolle; and Mr Drummond of Swan River Colony, in Australia, has given an account of a very large phosphorescent species occasionally found there.—*Gardner's Travels in Brazil.*

CONSTANCY AND CONSISTENCY.

No one affects to misapprehend the distinction between firmness and obstinacy. The former is recognised as the virtue of a great mind; the latter as the vice of a little one. The former proceeds from Resolve, that 'column of true majesty,' as Young finely says, which is founded upon reason; while the latter is a dogged adherence to a particular course, entered upon without conviction, and persisted in without reflection.

But the distinction between Constancy and Consistency, though really as well-marked, has attracted considerably less attention. A man may be constant, yet inconsistent; and consistent, yet inconstant. He may advocate, for instance, a particular measure which he supposes to be conducive to the interests of society; yet if he continue that advocacy after circumstances have changed, so as to render the line of conduct unadvisable, though true to the measure, he is false to his principles. Nothing can be more obvious than this fact when enunciated; and yet nothing is less likely to suggest itself spontaneously. When a statesman changes his opinion of a public measure, he is straightway complimented with the name of apostate. No one thinks of inquiring *why* he has changed his opinion, or whether the circumstance involves a change of principles. He has deserted *the* cause; he has betrayed his friends; he has gone over to the enemy. What is *the* cause? A certain political question, or the good of the country for which that question was originally agitated? Who are his friends and enemies? Certain noble and honourable individuals, or those who entertain right and wrong views of the national affairs? It may be that the charge is correct, that the deserter is really a traitor and a coward; or it may be quite the reverse, that he is a hero and a martyr—the outcry is the same.

What we would wish to see in such a case as the above, is a little impartial investigation of circumstances. When a statesman startles the country with a new confession of faith, let him be judged by the circumstances and the motive by which he is likely to be influenced. For example, when a man of education and experience of the world stands up in his place in parliament, and tells us that, till within the last three weeks, he never recognised the truth of Adam Smith's theory of trade, there is the greatest reason to doubt his veracity. And when we find that he proclaims this new opinion with the view of supporting, or of being supported by a party, the doubt assumes almost the character of certainty, all his representations to the contrary notwithstanding. When, however, the announcement is made under no prospect of individual or party gain, but apparently in all singleness of heart, honour instead of disgrace ought to be his portion. The acknowledgment of error is noble, even though it lower a reputation

for judgment. Better confess to having been a fool, than, from a sham consistency, live the life of a knave.

The real matter, then, for the moralist to complain of, is an invariable condemnation of change in sentiment. It should be remembered that movement is the natural state of the human mind, and that this, beyond all others, is the age of progress. In every new stage of life we abjure the sentiments of the previous one as illusions. The boy is as different in his ideas from the child, and the youth from the boy, and the man from the youth, as the wrinkles of age are different from the smooth skin of infancy. But in the midst of all this change, this metamorphosis of the very stuff of which the mind is made, we expect a man to be constant to some political or social dogma which he once entertained. Nay, the oddity is, we expect him to be constant to *hereditary* dogmas. It is a bitter reproach to say of his sentiments that they are different from those entertained by his family and ancestors. Even in matters of taste and custom, he is expected to be 'consistent.' 'I have seen the day,' mutters one shaking his head at a parvenu, 'when he was glad enough to eat out of a wooden spoon!' It is criminal, it appears, for the man, now that he is rich, to prefer a silver one. It may be that, since the family opinions were formed, a new condition of things has arisen which renders them—wise and proper though they might have been in their day and generation—unwise and improper now: but this is no excuse for the deserter of his family dogmas. It may be that the parvenu had been accustomed to the comparative luxuries of his new fortunes till they became necessities to him. But this is no excuse for the contemner of wooden spoons. If we hint that the opinions of the one and the tastes of the other are both consistent in principle, that they are both the result of existing circumstances, and both consonant with reason and nature, the insensate clamour only becomes the louder.

We may be told, however, that all this is soon at an end; that a single generation is enough to establish the new tastes and sentiments as securely as the ancestral ones. This is the very thing of which we complain. We desire no liberty for ourselves that we would not transmit to our posterity. We demand that men's words and actions should be measured by principles, not prejudices; that the inquiry should be, not whether they adhere to any particular dogma, but whether they exercise their judgment to the best of their ability. When we adhere to old sentiments, it should not be because they are old, but because they are conducive to the interests of the present race of mankind. And there are plenty of such ancient novelties, such new antiquities. There are sentiments that never grow old, that are never inapplicable. There are rules, both of public and private virtue, which are instinctive in all noble natures:

and as regards them, and them alone, is constancy a duty and a grace.

In order to know whether constancy merits the praise of consistency, it is necessary to examine the foundation on which it rests. We hear much, for instance, both in history and romance, of the fidelity of dependents to their chiefs. This sentiment rests upon reciprocity of services. The lord protects, and the vassal defends. The one leans upon the other; and a change in their relative positions can only take place through tyranny on the one hand, or treachery on the other. Let us suppose that the master is kind, and the servant grateful; that the attachment of the latter is bravely manifested through good and evil fortune, and that at length he seals his fidelity with his blood. Let us again suppose that the moral compact is broken by the lord; that he is cruel and tyrannical to his people, and ready on all occasions to sacrifice them to his selfishness; but that the vassal still loves on, still prides himself on his hereditary fidelity, and still gives up his life for his master. In these two cases the constancy is very different. In the one, it is the virtue of a man; in the other, the instinct of a cur. But neither history nor romance makes any distinction. It is constancy—therefore it is consistency. Such is the tyranny of names; so true it is that words are esteemed as things!

Another great quality of romance, and occasionally touched upon by history, is constancy in love. Devotion, or devotedness, which is the name it receives in fiction, is more especially attributed to women; and it is impossible to read without a smile the absurdities that are gravely put forth with this title as the very sublime of feminine virtue. A woman must be faithful in her affection even when the qualities that awakened it have disappeared. When she has discovered that it is no living and breathing man she has loved, but a phantom of her own imagination, she must still love on. She must be constant to the physical being after his identity with the ideal one has disappeared; and she must testify her faith in this kind of materialism by the sacrifice of wealth, station, life itself. Even indifference on the part of her hero must work no change in this marvellous constancy; and she must be reconciled to die, by the hope that the catastrophe may induce him to think of her when dead whom he had neglected when living.

*'Remember me—oh! pass not thou my grave
Without one thought whose relics there reside;
The only pang my bosom dare not brave,
Must be to find forgetfulness in thine.'*

*My fondest—faintest—latest accents hear:
Grief for the dead not virtue can reprove;
Then give me all I ever asked—a tear;
The first—last—sole reward of so much love!'*

One would think that romances of this kind were the exclusive production of the male sex, who concocted the absurdities for their own special benefit: but it is not so. Women, still more frequently than men, desecrate in their writings a passion which, unless founded on reason, can only rank with the grosser instincts of our nature. Such devotion is called sentimental; but it is really material. Such constancy is called consistency; but it is entirely the opposite.

In thus distinguishing constancy from consistency, we must not be supposed to forget that there are both natural and conventional laws which control—and ought to control—the dictates of abstract reason. To the former belong the parental and filial instincts, and to the latter the tie of marriage. The devotion of children

to their parents, and of parents to their children, is not reflective, but involuntary. It makes no calculations; it has no regard to expediency; it enters into no bargain of love for love. It pants indeed for a return of its own feelings, but this is not necessary to its nourishment. And wisely is it so ordered; for on family love are based all the noblest virtues of social life. As for marriage, it is one of those natural ordinances which society, for its own sake, respects. Even when affection does not consolidate the bond, this is effected by a community of interest; and the parties bear with each other's faults as much from a spirit of selfishness as of generosity.

If we look back only a score of years, what mad 'inconsistency,' in the popular sense of the term, do we find imbuving the whole mass of society! How many old dogmas have become obsolete! and how many new ones have taken their place! The most sacred theories of government, the most universally recognised laws of political economy, the most ancient customs of social life—all have been broken in pieces, and cast anew in a mould which would have amazed the best intellects of the last generation. Yet the age is consistent, for all its inconsistency. It is pressing forward, however unconsciously, to a determinate goal, and its changes are but so many relays on the road, to expedite the journey. Let us all help on the movement, but calmly and wisely. Let us not be satisfied with words, without inquiring into their meaning. Let us bethink ourselves that, as no sane man will judge of a sentence in a book without comparing it with the context, so no earnest searcher after truth will be satisfied with insulated facts without examining their general bearing and coherency. We shall thus be able to assist, each in his own sphere, in all desirable progress, and at the same time avoid lending ourselves to that idle clamour which, in a few years hence, will be looked back upon with the surprise and pity we now bestow upon the delusions of the past.

NATURAL SANITARY AGENCIES.

At this period, when the sanitary question is by slow degrees assuming the station of importance to which it has a just title, and from which nothing but the most obstinate unbelief has kept it back, the above subject claims for itself no small degree of interest. The truth, impressed by man's great preceptress in her handiwork, is, that all organised material, after accomplishing the object of its existence, and perishing, must be immediately removed, or so disposed of as to render the inevitable consequences of its putridity innocuous to the surviving races of animated beings. Such is the simple truth, to which only man, in his indolent indifference, has offered so long and so stout a resistance; a truth which nature has in vain endeavoured, from the beginning of creation to the present hour, by a series of the most interesting illustrations, to impress upon him. It is the design of the present paper to trace the methods by which she has endeavoured to enforce the lesson.

There are two classes of agencies engaged upon the work of removing effete material. The first is a corps of natural scavengers; and a very efficient body it constitutes: and, in the second, the chemical affinities of bodies are called into operation, more particularly those of the atmosphere. We shall deal with the zoological scavengers in the first instance. It is a subject of familiar remark, that rarely, if ever—the shrew-mouse is, we believe, the only exception—do we meet with the dead carcase of a wild animal. Animals are endowed with a peculiar instinct upon the approach of dissolution, which,

thus regarded, has an especial interest. Into the dens and caves of the earth, or into the deep recesses of the forest, or into some artificial retreat, far shut out from the busy world, the dying brute retires, and there breathes its last in solitude. Here the tissues which composed its body can rot, and putrefy, and become gaseous, and liquid, with injury to none, until, by the combined influence of time and weather, nothing remains but a mass of inodorous bones, which are soon themselves to crumble, and to form a portion of the soil upon which they rest. The large heaps of animal remains often found in caverns, have no doubt in a great measure their origin in the impulse of concealment antecedent to death. Where this law fails to act, it gives place to another, and a more rapidly effective one; or there may often be a combination of the two, the destruction of the elements being united to the labours of the true natural scavengers. These are the carrion-feeders.

The *Vulturidae*, among birds, have long enjoyed a high celebrity for the vigorous manner in which they apply themselves to this important task. Unless pressed by hunger, the vulture is stated by some naturalists to refuse to partake of untainted food; but when the putrefactive process has once commenced, it flies upon it with the utmost avidity, and gorges itself almost to suffocation. The assistance of these birds in the removal of noxious matter very naturally increases in importance with the nature of the climate in which they abound. The vulture, and its kin, would be in imminent risk of entire starvation in the gelid north, while almost daily dainties lie ready for them in the southern regions. Mr Swainson writes of them, that they are 'the great scavengers of nature in hot latitudes, where putrefaction is rapid, and most injurious to health; and the disposition of numbers is regulated by an All-wise Creator according to their needfulness. They are sparingly scattered in Europe; in Egypt they are more numerous; but in tropical America, although the species are fewer, the individuals are much more plentiful.' Travellers have on many occasions commemorated the activity of the operations of these birds in Egypt, more particularly in the large cities of that country, where they remove decomposing material of every sort, the carcases of animals, and the debris of all kinds which the inhabitants, with a stupid confidence in their filth-consuming allies, cast forth into their streets. They have even come under the protection of the legislature, and laws are in force at the present hour which impose penalties upon any who shall be guilty of molesting or destroying the regular filth-contractors of the East. These birds, in order to adapt them more effectually to the task which nature has appointed for them, possess an astonishing faculty of receiving and conveying to one another the tidings of a far-off feast. Mr Darwin believes that their rapid congregation around their prey is to be accounted for by their possession of the senses both of sight and of smell in an extraordinary degree. All naturalists are not agreed upon the question, but none deny that it is little less than miraculous to observe the apparently instantaneous communication of the intelligence to the scattered members of this carrion family. Condors and vultures before altogether invisible seem to pounce down almost by magic upon their banquet. Mr Darwin conjectures, and the solution appears simple and natural, that it is to be attributed to their high-sailing habits; that thus out of the field of vision ordinarily swept by the eye of the spectator when walking or on horseback, aloft in the air the vulture may be floating, looking down with keen interest upon the earth beneath, and instantly dropping upon its quarry when it is perceived. This rapid stoop, he adds, is the signal to the rest, which then hasten to the field from the

remotest points of the horizon. When engaged actually upon the work, the vulture executes it in a very workmanlike style, not leaving the carcase for some days together, until it is completely stripped of its integuments, and nothing left but the skeleton with its connecting ligaments. On the plains of Africa, where the huge carcases of the giant herbivores would lie to poison the surrounding atmosphere to an enormous extent, the scavenger is an immense bird of the vulture family, known as the *sociable vulture*, whose ferocity, activity, and appetite are commensurate with the arduousness of the labour which devolves upon it. Le Vaillant, the celebrated French traveller and naturalist, writes that he found upwards of six pounds of the flesh of a hippopotamus in the stomach of one, which, after a long and obstinate contest, he succeeded in killing.

That which the winged scavengers leave unconsumed, falls commonly to the share of the four-footed ones—the jackal and the wild dog. From time immemorial, these loathsome creatures have been regarded by the eastern nations, who neglected the lesson their example inculcated, as the benefactors of their communities. Mr Bell, in the 'History of British Quadrupeds,' is inclined to believe that the wild or half-wild dogs were the common scavengers of the camp of the Israelites—an office which their successors still hold among the cities of the East. 'Him that dieth in the fields shall the fowls of the air eat,' but 'him that dieth in the city shall the dogs eat,' was the awful curse which hung over some of the royal houses of the Israelites; and it seems to afford an indication of the respective functions of these two classes of labourers. Not less efficient is the shrieking jackal. It follows in the rear of the weary caravan, being certain of success when thirst, weariness, and disease have begun their work among the travellers.

The waters of the ocean, just as the wide extent of the air and earth, must likewise be preserved from contamination. A striking provision exists in a considerable number of instances for this end: it is the luminosity of dead fish. It is a mistake to believe this to be the result of putrefaction; on the contrary, a dead fish is only luminous until the putrefactive process commences, when the light disappears. It would seem probable that, very shortly after death, the gas known as phosphuretted hydrogen was produced on the surface of the body of the fish; but when, as a further step in decomposition, ammonia is evolved, the latter substance combines with the luminous gas, and the phosphorescence ceases. This appears to us the simplest solution of a phenomenon which has perplexed many philosophers. The light is the guide to the prey so long as it is most proper for consumption; after that it disappears. The scavengers of the great deep are its multitudinous inhabitants, which, from the voracious shark and his relatives downwards, to the smallest thing which traverses the waves, are all banded together in this common cause.

Nature has, however, an agent at hand, before which these sink into a comparative unimportance: it is the race of insects. Every one is familiar with the startling observation of Linneus, that three flies (*Musca vomitoria*) would devour a dead horse as quickly as would a lion! It is not beyond the truth. The whole tribe of flesh flies, from which our feelings turn with disgust, are, nevertheless, among the most eminent benefactors of mankind, more serviceable far than the gaudy flutterer or tintured butterfly in whose behalf our admiration is more generally and naturally enlisted. Wilcke, a Swedish naturalist, states, that so great is the productive capacity of a single species, that each insect can commit more ravages than could an elephant. A single female of the fly called the *Sarcophaga carnaria* will give birth to about twenty thousand young; and others are not wanting, the green flesh-fly particularly, to add their thousands in countless numbers to the mass of labourers. To these busy myriads is the work committed. In a few days the larvæ of the flesh-fly attain their full growth, and before this time it has been proved, by weighing them, that they will devour so much food, and grow so rapidly in twenty-four hours, as to increase their weight nearly

two hundredfold! Thus an approximative estimate can be conceived of their value as sanitary agents. The carrion beetles rank next in consequence, and take the place of the flies in the consumption of the remainder. The great rove beetle does an incredible amount of work in this way, and will commit ravages upon meat left within its reach, which are not likely to pass from the memory of the housekeeper. Kirby and Spence inform us that there is a small cockroach which gets into the hut of the unfortunate Laplander, and will in one day annihilate all his stock of dried fish. It is a remarkable fact, that many kinds of perishable animal matter have a peculiar insect appropriated to them. Each to its own—a law which has a broader range in nature than that under which it is here contemplated—seems to be the commission by which these winged powers go forth to their labour. Next to these come the *termites*, the ant tribe; and their importance swells with the fervid nature of the climate. In tropical countries they almost supersede the other creatures in the work of destruction: they are consequently of a large size, are produced in vast multitudes, and possess a prodigious voracity. They will attack, in whole armies, the dead body of an animal, and in a surprisingly short space of time will denude it of every particle of muscular and adipose material, leaving behind only the ligaments and bones. There is in these labours an amusing succession of workmen, which is exceedingly curious. First come the skin-removers, then the sarcophagous insects, then the carrion beetles and ants, and these are followed finally by the smaller carrion insects—the *corymbes* and *nitidulæ*: when they have left off work, nothing remains to pollute the atmosphere. The *trogidae* consume the cartilage. They were found by Ballas removing the last perishable substance from the dry carcass on the skeletons of animals which had perished in the arid deserts of Tartary. The desert, indeed, with its heaps of bones of men and animals bleaching in a burning sun, while it is a melancholy scene, yet exhibits to us, in a striking degree, the wonderful efficiency of the instruments which are in the hands of the Creator for the expurgation and wholesomeness of his creation. 'The shard-borne beetle, with its drowsy hum,' is the type of another class of insects which consume these excrementitious materials that might otherwise contaminate the air. In a moment a thousand shining insects will be seen busily devouring such matters, and depositing eggs for the future production of larvæ which are likewise to feed upon them.

The strangest feature of our subject remains behind. It will be a surprise to most who peruse this paper, to be informed that there are *natural grave-diggers*—creatures which perform this remarkable office in obedience to a wonderful instinct which animates them. There are few of the marvels of nature that come upon us so unexpectedly as this. There are some tribes of beetles (the *Necrophori*, or burying beetles) which perform this task, the most familiar example of which is the *N. Vespillo*. Two or more commonly engage in the work. They select a proper spot for the sepulture of the body, generally as near to it as possible. The cavity is then dug, and the dead animal is, by dint of unwearied labour, laid in its tomb, and covered with soil; the beetles previously depositing their ova in the carcass. But the experiments of Gladstich, who seems first to have commemorated them, are so enchanting, and exhibit the insects to us in such an amusing light, that we make no apology for quoting the results from a popular work on entomology, in which they are translated. His attention was first drawn by the discovery, that the dead bodies of moles which he had observed lying in the garden beds disappeared in a very mysterious and unaccountable manner. He determined to watch the corpse-stealers, and he found they were none other than the burying beetles we have mentioned. Having obtained four of them, he put some earth in a box, and covering it with a hand-glass, he laid two dead frogs upon it, and left the industrious beetles to their task. Two out of the four set themselves to the interment of one of the frogs, while the others occupied themselves, undertaker-like, with first running round and

round the dead body of the other, as if to get correct ideas of its dimensions. In the space of twelve hours one frog had altogether disappeared, and the soil was laid smoothly over him. A linnet was then laid upon the earth, and this was a severer duty by far; only two undertook it, a male and a female. After a little time, they quarrelled over their work, and the male drove the female away, and set to by himself. For five long hours the poor labourer continued his operations, digging a cavity close to the body of the bird. He then got out of it, and for a whole hour lay down by the bird, as if to rest. In a little time afterwards the linnet was dragged into the grave, and its body, which would only lie half in, was covered with a layer of soil, somewhat like a newly-made grave. In short, at the end of fifty days, the four beetles succeeded in burying twelve carcasses: of these, four were frogs, three birds, two fish, one mole, two grasshoppers, and part of the entrails of a fish, and of the lungs of an ox.

The débris of the vegetable world, which is often as pestiferous, if not more so, than that of the animal creation, must likewise be removed; and this is the appointed task of insects. It was to be expected that these agents should exist in greatest vigour where the circumstance of climate produces most work; and this is what we find to be the case. No sooner does a giant tree lie prostrate on the earth, than it is at once the object of attack to myriads of insects. Ants, and the boring-beetles, begin the work, and are rapidly assisted from other quarters, until the mighty mass is reduced to a small heap of crumbling material, whose final destruction is accomplished by rain and weather. Travellers inform us that it is not uncommon to meet with whole villages which have been deserted by their inhabitants, having been almost swept from the face of the earth by the sole instrumentality of these insects, nothing remaining of the tenements which once formed the village. In two or three years' time there will be a thick wood grown up in its place; nor will a vestige of any structure, unless of stone, remain to indicate its former position. While, then, we can sympathise with the dolorous tales we hear about the destructive effects of the boring insects of the tropics, we should not forget that these are only minor evils compared with what would result were no such agency in operation.

Though the remainder of our subject deserves a better place than the end of a paper, it must be introduced here. The atmosphere being the hourly recipient of impurities of every kind, from a thousand ceaseless sources, it is necessary that means should be taken to guard against its too great contamination: and such means exist. From the accumulated population of our great cities, from the tens of thousands of our furnaces, from the vast masses of rotting, putrefying material our wasteful negligence allows to collect, and from innumerable other sources, there is a mass of noxious matter cast into the air which it is completely staggering to think of. This has all to be disposed of, to be rendered innocuous, and to be returned to the earth again. The principal impurities to be dealt with are sulphuretted hydrogen, sulphurous acid, carbonaceous particles, and a medley of substances known as organic matters. Atmospheric oxygen is the grand remedy for most of them. This wonderful gas, possessed of a range of affinities equalled by few other chemical elements, attacks such impurities, and shortly reduces them to the not only innocuous, but directly beneficial compounds—ammonia and water. The decomposition is strangely progressive: it proceeds from complex to simpler combinations, until the simplest has been attained, and at this point it ceases altogether. To rain and wind is assigned the task of disposing of the heavier particles, such as soot, and some of the minute molecules of animal matter above alluded to. Ammonia, the product of putrefaction, is also brought down by rain, and placed at the disposal of the vegetable world. Lastly, upon the entire vegetable world itself is devolved the greatest of all nature's sanitary operations—the restitution of the oxygen to the atmosphere by the deoxidation of its carbonic acid.

Such is the impressive lesson before us; and such are some of the illustrations which enforce it. Nature has appeared to us as an instructress teaching by example: it must not be forgotten that she wields the rod as well. Man may despise her instruction; but he pays the penalty in a retributive entailment of disease and suffering.

THE SCHOOL FOR LIARS.

Love, they say, 'dwindles down with the meal-poke;' but this was not the case with the love of Jacob's master and mistress. They were a young, careless, and, notwithstanding their perplexities, as yet happy pair. They had married without thought, confident that Uncle John would come round as soon as the thing was done, and could not be helped; and even now, although somehow or other their resources were becoming scantier and scantier, and the prospects of the world looking colder and drearier, they neither could nor would believe in the old man's obduracy. How was it possible for them to do so? They were his nephew and niece, and had been brought up in the idea that his large fortune was one day to be divided between them. They had never yet set their hearts upon anything in vain, if it was in Uncle John's power to get at it; and now, was it to be thought that, because they had merely helped themselves to one another without his sanction, he would seriously turn his back upon them?

But Uncle John had good cause to be vexed, though perhaps little cause for irritation. Under his mischievous indulgence they had grown up wild, thoughtless, and extravagant; and his only consolation had been, that it was still in his power to neutralise his error, by providing them each with a proper helpmate. Their marriage, therefore, came upon him like a thunder-clap; and their very unconsciousness of its being possible for them to have sinned beyond his forgiveness, and the evident incredulity with which they listened to his determination to leave them to their fate, made matters, if possible, still worse. But affairs at length became so serious, as to stagger even the young couple, and they determined to grow prudent forthwith, and look warily about them. Since they had no fortune at all—not a shilling—but what belonged to Uncle John, it was necessary to cut down their establishment. They parted, therefore, with the cook; Jemima expanded into the maid-of-all-work; and the man shrunk down into Jacob.

Jacob was a raw country lad of seventeen, who, at the invitation of his cousin Jemima, had manfully left his mother, and come up to London to push his fortune. As for Jemima herself, she had been in the family from infancy in one capacity or another, and although a year or two older than Jacob, she was still young enough to find amusement in the vicissitudes of her lot. The marriage of her young mistress was a great event in Jemima's life; so was her taking upon herself the entire ministerial duties of the household; and so was her introducing into the family a relation and protégé of her own. She was now full of the cares of the world; she talked of her trials, and occasionally sighed deeply. But to do her justice, she worked hard for all that, and indeed was rarely idle for a moment in the day.

Some moments, however, she did lose in gazing proudly at Jacob, when he had squeezed himself into his new livery, and stood before her with his arms sticking out from his sides like a couple of radishes. His face, no longer dirty with tear-channels, was polished as brightly as soap and water could do it; and the expression of alarm with which he had looked round him at every unaccustomed sight and sound, was now to some extent controlled by the feeling of youthful confidence inspired by new clothes.

'What would mother think?' said he, with a bashful look towards the glass.

'She would think it a good thing,' replied Jemima loftily, 'to have somebody to take her son by the hand.'

'But I say, cousin——'

'Don't call me cousin: call me Jemima.'

'Well, Jemima; mother do say this is a desperate wicked place. She says I am not to believe a word that comes out of a human mouth.'

'No more you are,' said Jemima. 'You will hear the truth from nobody but me; and if I hear anything but the truth from your lips, I will send you back to your mother by the fly-wagon that moment. But hark! there is a double knock, and your service begins. Away, and open the door boldly; throw it back to the very wall, and don't sneak out your head, like country servants, as if you were afraid of a bailiff. Remember, master is not at home.'

'Not at home?'

'Not at home—remember that for your life.' When Jacob, after a nervous glance at the glass, had disappeared up the staircase, Jemima remained for some time in an attitude of listening; but at length, anxious to know how her protégé would acquit himself, she ascended a few steps, and heard him, to her unspeakable alarm, let in the forbidden visitor.

'What is this you have done?' cried she, half dragging him down the stair by the arm. 'Did I not tell you master was not at home?'

'All's right!' replied Jacob smiling; 'don't you be uneasy.'

'Oh you little wretch!' cried she, flinging away the arm of the youth, who was at least a foot taller than herself. 'What ever is to be done?' and she wrung her hands in real dismay. This made Jacob chuckle outright.

'I tell you,' said he, 'it's all right. Master was in, after all! I heard him cough in the parlour; and opening the door quietly, saw him peeping through the blinds. But don't take on, Jemima: it was not a lie you told me: bless you, you didn't know it!' Jemima had no time to storm, for they now heard the street-door shut; and presently the parlour bell rang violently.

'Now I shall catch it!' said she. 'Master would not have seen Uncle John this morning for a thousand pounds. Stand out of my way, you country lout!' and she swept past the astonished Jacob like a whirlwind.

Jemima did 'catch it,' and to some purpose; and she was warned that the very next instance of disobedience on the part of her cousin would close this chapter in his metropolitan adventures.

'But after all, dearest,' said the young wife, when she was alone with her husband, 'why were you so anxious to avoid Uncle John this morning, and how is it that he made his visit so short?'

'The why is, that I am a fool; and the how, that he is another. The truth is, I was so elated by his appearing to come round yesterday, and so confident that matters would subside forthwith into their usual channel, that—that—I gave way to temptation.'

'Mercy on us! You did not play?'

'No; worse than that: for if I had played, I might have won. I bought the Piccolini vase.'

'You?—without a shilling! and to involve yourself in a debt, such as Uncle John would never forgive in this world, for a piece of mere trumpery! Oh what insanity!'

'That is all owing to your want of taste: if it had been a set of jewels, you could understand it. But what was I to do? I must have bought it yesterday, or lost it for ever; and you know how long I have hungered and thirsted after it, and how completely it was understood among all our acquaintances that it was to be mine. I felt as if I should not have enjoyed Uncle John's fortune without it!'

'But how is Uncle John a fool as well as you?'

'Because—and I am ashamed to tell it—he believes me to be now incapable of such extravagance; and I am to meet him presently at his solicitor's office, to enter into an arrangement which will end all our troubles.'

'Oh how delightful! And you were terrified to let

Uncle John in, lest he might stumble over that unlucky vase? The catastrophe would have been awkward certainly.'

'Only by being premature. I hate myself for such mean concealment, and am determined to act at least in some degree the part of a man of honour. As soon as all is settled between us, I shall confess this last lapse of virtue; and, to prove the sincerity of my repentance, make him a present of the vase.—But how now, sir? What do you want?' This question was addressed to Jacob, who had been standing within the room for some minutes, turning his staring eyes and open mouth from one interlocutor to the other.

'I only wanted to hear what you were saying, sir,' said he, abashed; 'you spoke so loud.'

'Oh you did, did you? And was that all that brought you up stairs?'

'Oh dear no. But there is a man at the door with a piece of crockery on his head, and Jemima said I was to ask whether he was to bring it in.'

'These wretches will drive me distracted!' cried the husband. 'Standing on the steps, in view of the whole street!' and he rushed out of the room, and opened the door with his own hands—Jacob vanishing in alarm at the same moment down the kitchen stairs.

When the magnificent vase was safely placed upon the parlour table, the difficulties of the thoughtless pair seemed at an end.

'But we must get it out of the way,' said the gentleman, 'at least for this day. The china closet will be the safest place; for there it will be under lock and key. But I shall have barely time to dress, and get to the solicitor's by the appointed time. May I trust to you, my dear? Will you move it with your own hands? for I should faint at the bare idea of a careless servant touching it.'

'Yes, yes; you may trust to me: but do now go, like a dear; for you know you are always too late.'

'But will you move it with your own hands? Do you promise me?'

'I will—I do. Now go,' and, paying the carriage in advance upon her lips, the young husband ran away to dress.

The vase was not too heavy for a lady to carry; and when Jemima in another minute made a hasty entrance into the room, her mistress had actually raised it from the table.

'Goodness gracious! put down that great thing, mem,' said Jemima; 'put it down without thinking twice!'

'What is the matter?' asked the lady hastily, doing as she was bidden.

'The matter is, mem, that the milliner is here at last! Such a gown! such flounces! such thingumbobs! Oh my! But she has not an instant to wait; and unless she can try it on this moment, you will not be able to set eyes on her again for a week.' The mistress had half bounded towards the door, when, stopping suddenly, she turned back a glance of irresolution at the vase.

'I was going to take that vase,' said she, 'to the china closet.'

'You take it, mem?—you! Oh, excuse me—that belongs to my department.'

'So it does,' said the mistress; 'though I promised—' But here a shrill impatient cough from the hall decided the question. 'You will carry it more safely than I,' added she; 'but it must be with your own hands. Promise that, Jemima; and as Jemima promised, off the lady flew to the milliner.

When the waiting-maid was left alone, she examined the vase with a look of sovereign contempt.

'What fancies some people have!' muttered she. 'How irrational to lay out money on a piece of useless trumpery like this! And I must carry it with my own hands forsooth, as if it was made of gold! Well, a maid-of-all-work, I suppose, has no choice; and I must take this with the other hardships of my lot.—Ah! what are you doing there, you great oaf, appearing

as suddenly and silently as a ghost? What do you want?'

'I only wanted,' said Jacob, 'to see if I could hear what you were saying, you spoke so low.'

'Indeed! And was that all?'

'No. There's a young woman at the area door with caps, and she calls you Miss Jemima—he! he!—and says you must go down to her, please, as quick as ever you can.'

'Jacob,' said Jemima authoritatively; 'remove this wause.'

'This what?'

'This wause—this here thing on the table—to the china closet; and if you break, or chip, or injure it in anyway, my advice to you is, just to take two cords, and hang yourself with one, and send the other to your mother. Do you hear?'

'To be sure I do; but there is no occasion for the cords, for I could carry half-a-dozen crocks like that any day, without letting one of them fall.' When Jemima had gone down to the area, Jacob took the opportunity of examining not only the vase, but the other articles in the room, and more especially the pictures. He in fact, though this was only his first day, felt himself growing well up into a domestic, and flattered himself that his awkwardness was fast polishing away by the friction of experience. At length, however, when he was just about to execute the orders he had received, a double knock called him to the door.

'Have you moved the wause?' cried Jemima from below, just as his hand was upon the latch of the door. Jacob was flurried. He ought to have done it long ago; and would do it the moment this new customer was gone. It would be the same thing in the end. The London people, it appeared, said anything that was most convenient.

'Yes, Jemima,' he replied steadily; and then opened the door to Uncle John.

'Is your master at home?' said Uncle John. Jacob was puzzled; for this time he had received no instructions on the subject.

'I'm a new boy, sir,' said he at length, prudently resolving not to commit himself; 'but if you will step into the parlour, I'll speak to Jemima.'

When Uncle John saw the vase staring him in the face from the table, he seemed thunderstruck; he stared at it in turn for more than a minute, silent and motionless; but soon began to stride rapidly up and down, looking every now and then as if he was about to demolish it with his cane.

'Here, you!' said he suddenly to Jacob, who stood eyeing him and the vase alternately with open mouth; 'put it down behind that screen. There. Now take care you don't tell any human being that I know anything about it. Will you be silent?'

'If they ask me whether you have seen it?'

'Say no! There is a crown for you. Will you say no?'

'I suppose I must,' said Jacob, pocketing the crown, and feeling as if he was the virtuous victim of an inscrutable fatality. When about to descend the kitchen stairs, he saw his mistress steal on tiptoe across the hall.

'Send up Jemima,' said she pantingly. 'Oh, Jemima,' she continued, in an agitated whisper, as the girl appeared, 'there is Uncle John! Did you do what you promised? Have you removed the vase to the china closet?'

'Surely, mem!' said Jemima, indignant at the doubt. 'I of course did as I said. Do you take me for a—?'

'Oh, you are a dear, good, trustworthy girl! And with your own hands, Jemima?'

'I rather think so, mem! For my part I don't know that there are any other hands in the house than the maid-of-all-work's. But I hope I know my duty, and do it. I trust not to sink till you are provided with somebody stronger. That I do, mem.'

'My life!' cried the husband softly from the other

end of the hall, 'a word with you—come here. I need not ask if you have kept your promise? You have put that detestable vase out of the way?'

'Think it done!' replied the wife gaily.

'And with your own hands? for I would not have any accident happen to it after all. Eh?'

'Can you doubt it?' demanded the wife reproachfully.

'Forgive me, dear love; you are truth itself!' and the blush that rose into the cheek he kissed made him think that even truth is capable of being embellished by beauty. The young couple now ventured into the presence of Uncle John.

There was something so calm and stern in the old man's appearance, that both nephew and niece felt a sudden chill.

'I called,' said he, 'in order to walk with you to my solicitor's; but since my niece is here, I shall take the opportunity of letting her know the position in which we stand. I opposed your marriage on principle, because I saw that, having precisely the same defects of character, you were quite unqualified to go through the world together. Your headstrong folly, however, was partly my own fault, and I determined to make the best of matters as they stood, provided I was well assured that the serious warning you had received had at least cured you of your habits of extravagance. All this, however, I have been obliged to take merely upon your own word; proceeding upon the supposition that falsehood is not one of your vices. Nephew, what do you say?'

'I hope I bear the character of a man of honour!'

'Niece?'

'I would not deceive my dearest uncle for the world.' Uncle John removed the screen from before the vase.

'What is this?' said he. 'Have you any explanation to make? You—I say you, nephew?' But the nephew was gazing at his wife, with expressions of scorn, rage, and pity chasing each other across his face. He whispered something in her ear. It was a smooth, yet vulgar, frightful word of two syllables; and staggering away from him, she appeared about to fall, as if she had received a blow. *Jemima*, who was at the door, flew in, and caught her mistress in her arms; but the latter reviving at the touch, thrust her away with abhorrence.

'Base, ungrateful, detested——!' said she, and the short smooth word came forth like a pistol-shot. It was instantaneously echoed by *Jemima* herself, who bestowed it upon Jacob, together with a sound cuff on the side of the head. Jacob, resplendent no more in livery, was now in the garb of a ploughboy, with a stick and his bonnet in one hand, and a small dirty bundle in the other. He had entered the room with his usual want of ceremony, and the salute of *Jemima* went high to make him vanish in the same fashion.

'Oh, I don't mind it,' said he; 'not a bit. I wish you would give me one a-piece, for I deserve them all! Mother will give me worse than that—and what can such a desperate liar expect?'

'Why, what have you been doing, boy?' demanded Uncle John sternly.

'Oh, don't you talk to me!' said Jacob; 'for bad as I am, it's not all my fault. By telling a lie to *Jemima*, I did the mischief; but if it had not been for you, you wicked old man! it would have come out right in the end. I heard master tell mistress that he repented buying that ugly crock; that he never would do so again; that he would confess all to you; and that he would make you a present of it to-morrow—much good might it do you! Now, if I had told him in time what I ought, does it not stand to reason that he would have made all right before it came to calling names and slapping people's faces? But you, you wicked old man! to put a second lie in my mouth—to bribe a poor boy with a crown to go on from bad to worse; to—you ought to be ashamed of yourself! But I will give you back your money: no I won't; it would only en-

courage you. I will—I will!—and he mopped his eyes with the end of his bundle—'I will go home directly, and tell mother!' and Jacob lifted up his voice and wept aloud, groping his way to the door through his tears.

'Stay, boy,' said Uncle John, after a moment's pause; 'you have given us all a lesson, and I trust we shall be the better for it. It seems I am as bad as any of you! Well, I cannot deny it. None of us, I believe, meant any mischief. We persuaded ourselves that we were telling only a harmless lie! There is no such thing. The effect of falsehood depends upon circumstances of which we are ignorant, and which we cannot control. The moment the lie has left our lips, it is beyond our reach, and we have put a missile of destruction into the hands of the demons. Let us forgive one another, and forget the "crock." Get you into your livery again, Jacob; and do you, nephew, give me your arm to the solicitor's.'

THE FOREIGN COMMERCE OF GREAT BRITAIN.

THE comparative advantages of home and foreign trade have been frequently, and, we think, needlessly discussed. Both are in reality one thing—a result of the necessities and demands of society; and one cannot be favoured in preference to the other, without inflicting a general injury. Nevertheless, from the beginning of the world, foreign trade has been looked upon with jealousy by politicians, as if it was something that did not come into the ordinary stream of events at all. It is as natural, however, as the currents of the ocean or the course of the storm. Winds, waters, birds, and men, are alike the ministers of nature in carrying her productions from one country to another, and planting new seeds in every soil adapted for their reception; and that nation which refuses the treasures proffered by commerce, or accepts them under invidious restrictions, is not more wise than if it drew a cordon round its coasts to prevent the material agents of the bounty of Heaven from bestowing a new fruit or flower upon the soil.

Few countries owe so much as Great Britain to the agency of man in this kind of distribution; or, in other words, few possess less indigenous wealth, with the exception of that of the mineral kingdom. The inhabitants lived on roots, berries, flesh, and milk, till agriculture was introduced upon the coasts by colonies from Belgium, and extended subsequently by the fortunate tyranny of the Romans, who exacted a tribute of corn. At this time our fruits were nearly confined to blackberries, raspberries, sloes, crab-apples, wild strawberries, cranberries, and hazel-nuts. In all Europe, according to Humboldt, the vine followed the Greeks, and wheat the Romans. We had hardly any culinary vegetables of our own; and one of the queens of Henry VIII. was obliged to send to Flanders on purpose when she wanted a salad. It was not till the reign of Elizabeth that edible roots began to be produced in England. The bean is from Egypt; the cauliflower from Cyprus; the leek from Switzerland; the onion from Spain; spinach and garlic from France; beet from Sicily; lettuce from Turkey; parsley from Sardinia; mustard from Egypt; artichoke from Africa; rhubarb, radish, and endive from China; and the potato from America. Our present fruits, with the exception of the few we have mentioned, are all exotic; and in the animal kingdom, our horses, cattle, sheep, swine, &c. have been so much crossed and re-crossed by foreign breeds, that our ancestors, if permitted to revisit the earth, would hardly recognise the species.

The growth of the foreign trade of England is both a curious and an important subject. Before the Conquest, it was carried on by means of strangers; the English receiving passively silk, Oriental luxuries, books, precious stones, and relics, in return for metals, slaves, trinkets in gold and silver, and silk embroidery. Athelstan had tried in vain to tempt his own subjects into

commerce, by ordaining that a merchant who had made three long sea voyages on his own account, should be admitted to the rank of a gentleman. But in two centuries after this, we find English writers boasting that all the world is clothed with their wool. The wool was manufactured into cloth in Flanders. In 1354, the exports, consisting chiefly of wool, amounted to £212,338, without including tin and lead; and the imports, of fine cloth, wine, wax, linens, merceries, &c. to £38,383. The balance, therefore, must have been considerably in our favour. Trade now seems to have been looked upon with some interest, and our princes would needs have the kindness to encourage it; in pursuance of which good intention the parliament, in 1402, ordered all importers to invest the whole proceeds of their cargoes in English merchandise for exportation. At this time the chief revenue of the country was drawn from such sources; but political economy had not yet taught that the best way for governments to encourage trade is to let it alone.

The kings, however, were not satisfied with drawing customs from the industry of their subjects; they took to trade on their own account. The kings of Sweden, Naples, and Scotland, were merchants on a small scale; while King Edward of England was an extensive ship-owner, and, as an old author tells us, 'like a man whose living depended upon his merchandise, exported the finest wool, cloth, tin, and the other commodities of the kingdom, to Italy and Greece, and imported their produce in return, by the agency of factors and super-cargoes.' In 1615, an anonymous writer enumerates 454 English ships employed in foreign commerce, besides those trading to India; but he gives us no idea of the amount of tonnage. In 1622, however, the total amount of exports had increased to £2,320,436, and that of imports to £2,619,315; and in 1648, we are told by a pamphleteer that 'England alone enjoyed almost the whole manufacture, and the best part of the trade of Europe.' In 1662, the imports were £4,016,019, and the exports only £2,022,812, showing a balance against us of nearly £2,000,000. In 1720, the imports were upwards of £6,000,000, and the exports nearly £7,000,000. In 1750, the imports were nearly £8,000,000, and the exports between £12,000,000 and £13,000,000. In 1800, the exports were upwards of £45,000,000, and the imports upwards of £24,000,000.

This fortune is the more brilliant, from the calamities our merchants had to endure; who lost, in the American war of independence, £2,600,000, in ships and cargoes taken by the enemy. But the loss of the enemy themselves, they had the comfort of knowing—including the deprivation of their fisheries—was still greater; which 'puts one in mind,' says Macpherson, 'of the story of the attorney who, when his client complained that he was reduced to his last guinea by his lawsuit, comforted him with the assurance that his adversary was reduced to his last farthing.' In 1780, the commerce of the country received another tremendous blow from the French and Spaniards, in the capture of five East Indian and forty-seven West Indian ships at one fell swoop; and before the end of the century, it is calculated that we had lost in this contest at least three thousand vessels.

In 1820, the exports, including foreign and colonial goods reshipped, were, in round numbers, £44,000,000, and the exports £30,000,000; in 1830, the exports £46,000,000, and the imports £42,000,000; in 1840, the exports £65,500,000, and the imports £60,500,000; and in 1846, the exports £76,000,000, and the imports £83,000,000.

The figures of this last paragraph are taken from M'Culloch's 'Account of the British Empire;' and the same authority is followed (although without adherence to his plan) in the following view of the actual foreign trade of Great Britain.

From Russia we receive tallow, wheat, flax and hemp, rapeseed and linseed, tar, timber, bristles, ashes, hides, and wax; in payment of which we send her cotton-twist,

and, in smaller quantities, woollen manufacture, salt, coal, hardware, lead and shot, tin, &c.; together with coffee, indigo, spices, and other articles of foreign and colonial produce. This trade employs much shipping, almost wholly the property of English merchants. The total average amount of our own produce and manufactures exported is about £1,816,000.

Our trade with Sweden and Norway consists of imports of timber, iron, and bark, and exports of cottons and cotton-twist, woollens, earthenware, hardware, and colonial produce. The amount exchanged is about £250,000 each way.

From Denmark we receive about £213,000 worth of corn—rapeseed and other articles in smaller quantity; sending her in return coal, salt, iron, earthenware, machinery, and colonial produce.

Our exports to Germany, including Prussia, amount to upwards of £6,000,000, and consist of cotton-stuffs and twist, woollens, refined sugar, hardware, earthenware, iron and steel, coal, salt, &c. and a very large quantity of colonial produce. The imports are chiefly wool, corn, flax, timber, zinc, &c.

Holland and Belgium supply us with butter, cheese, corn, madder, geneva, flax, hides, &c. to the amount of £4,500,000; receiving, in return, cotton-stuffs and twist, woollens, hardware, earthenware, salt, coal, &c. and colonial produce.

The average exports to France consist of linens and linen-yarn, brass and copper manufactures, machinery, coal, horses, &c.; and the imports are brandy, wine, silk (raw and manufactured), gloves, madder, eggs, skins, and fruit. The amount is as yet under £3,000,000, but will doubtless increase, as the insane jealousy of the two governments, which so long distracted the world, is now disappearing—at least from the tariff—like other venerable follies.

From Portugal and Spain we have wine, wool, fruits, olive oil, quicksilver, barilla, cork, &c. to the amount of nearly £1,500,000; paying for these articles in cottons, woollens, linens, hardware and cutlery, iron and steel, soap and candles, leather, &c. Spain is our largest customer for cinnamon.

Italy furnishes us with thrown silk of the finest quality; olive oil; straw-plait, and straw for hats, which we now mostly manufacture ourselves; wheat (chiefly at second hand from the Black Sea), fruit, wine, barilla, marble, and other articles. We give in return a considerable quantity of cotton-stuffs and twist, woollen manufactures, refined sugar, hardware and cutlery, iron and steel, &c.; besides large supplies of colonial produce. This trade exchanges upwards of £2,500,000.

Our exports to Turkey, Greece, &c. are of the same kind, but to the amount of little more than £1,500,000; while we receive from these countries opium, madder, fruits, oil, cotton, drugs, and dye-stuffs, &c.

The amount of the trade to the whole of Africa, including Egypt and our own provinces, is considerably under £2,000,000. It supplies us with cotton-wool, flax, and some drugs, and other raw produce from Egypt, for which we make the usual returns, with the addition of glass and machinery.

In the markets of the United States our business maintains the same ascendancy as when the country was a colony of our own; only exhibiting an increase proportioned to the waxing greatness of the two nations. Cotton and tobacco are the staple imports, with wheat-flour and wheat, rice, skins and furs, hides, staves, &c.; and the staple exports cotton, linen, and woollen manufactures, with hardware and cutlery, earthenware, salt, brass, copper, apparel, books, &c. The amount exchanged is considerably upwards of £6,000,000.

Our trade with the whole of the rest of the American continent, with the exception of our own colonies, is not so great by nearly £1,000,000. We import bullion and precious stones, dye-stuffs, cabinet-woods, cotton-wool, sugar, coffee, cocoa, &c.; and remit chiefly in cottons, linens, and woollens.

Tea and silk are the principal imports from China.

and indigo and sugar from India, together with smaller quantities of cotton, silk, coffee, saltpetre, piece goods, spices, drugs, rice, &c. To the former country we export goods to the amount of little more than L.1,000,000; and to the latter about L.6,000,000, chiefly in cotton-stuffs and twist.

The colonial trade supplies us with wool, wine, hides, ivory, &c. from the Cape of Good Hope, to the amount of L.500,000, paid for in the usual exports; and with palm-oil, ivory, teak, hides, wax, &c. from Western Africa, to about the same amount, paid for in cottons, guns and pistols, hardware, &c. The principal import from Mauritius is sugar. Exports as usual, to the amount of more than L.250,000.

Our North American colonies take from us about L.2,750,000 worth of woollens, cottons, linens, &c. paying in timber, wheat, furs, fish, ashes, turpentine, &c. The West Indies supply us with sugar, coffee, rum, cotton, pimento, molasses, mahogany, logwood, fustic, cocoa, cochineal, ginger, hides, &c. Here we are tempted to enter upon an investigation of the value of the colonial trade generally, deducting fiscal expenditure; but this we shall leave to a subsequent paper, and in the meanwhile adhere to what properly constitutes British foreign commerce; drawing our statistics from miscellaneous but trustworthy sources.

No view of the commerce of a country can approach to completeness without some distinct idea being given of the customs charged by the government. In England, the origin of these duties is hidden in the dark ages; but at the close of the tenth century, we know that every boat arriving at Billingsgate paid for custom one halfpenny; a large boat with sails, one penny; a keel or hulk, fourpence; a vessel with wood, one piece of wood, &c. At that time vessels from the continent 'showed their goods, and cleared the duties.' The nature of these duties may be collected from the fact, that German merchants paid at Christmas and Easter two gray cloths and one brown one, ten pounds of pepper, five pairs of men's gloves, and two vessels of vinegar.

In 1266, we find a regular export duty on wool, payable, like the above, twice a-year; and in 1282, the total amount of customs is stated at L.8411, 19s. 11½d. The king's claim to the duties was not established by statute till the reign of Edward I.; but they seem to have been all along tacitly considered his private property. They were frequently assigned to foreign merchants in payment of a debt of the king; and in Scotland, Alexander I. turned to this account the customs received at Berwick.

In 1303, we find a charter of commerce granting certain facilities to foreign merchants, in return for which they came under covenant to pay certain duties. In this charter the 'earnest penny' is mentioned as a seemingly indispensable part of a wholesale bargain. In 1329, the whole customs of England were farmed by a Florentine company for L.20 a-day. In 1354, the customs on exports (consisting almost wholly of wool) amounted to L.81,846, 12s. 2d., and those on imports to L.566, 6s. 8d. Twenty-eight years after this, the first attempt was made to anticipate the revenue, by granting a handsome discount to those merchants who paid duties in advance. So late as the reign of Queen Elizabeth, the customs were farmed for L.14,000; but that princess increased the sum to L.42,000, and afterwards to L.50,000. In 1613, they were estimated, including imports and exports, at L.148,075; in 1641, at L.500,000; in 1657, at L.700,000; and in 1709, at L.1,353,483. In every tenth year, from 1760 to 1800, the movement is as follows:—L.2,000,000; L.2,500,000; L.2,800,000; L.3,750,000; and L.6,800,000. In 1815, the customs' revenues amounted to L.11,360,000; and in 1845, to L.31,706,197.

These are the heads of the strangest of all the strange chapters in the world's history. But in reviewing it, we are apt to forget the effect of the industry of this island upon the fortunes of the other nations. If we look back to the twelfth century, when we are told all

the world was clothed with our wool, we find that the whole quantity exported could not have amounted in value to nearly L.250,000. In what relative condition must our customers be now, when they buy from us L.24,000,000 worth of manufactured wool? In the seventeenth century, again, we hear that England was the greatest trading country, and almost the only manufacturing country, in Europe. At that time we imported L.4,000,000, and exported L.2,000,000; whereas at present, when we enjoy only a portion (although the largest portion) of trade and manufactures, the mere duties on our imports alone amount to L.22,000,000. What, then, must be the relative position of Europe in the seventeenth and nineteenth centuries? Commerce, in fact, is twice blessed—to the nation which gives, and to that which receives; and in reflecting on the wonderful destinies of our country, we should never forget her influence on the destinies of mankind.

GOVERNMENT EDUCATION.

We have on divers occasions shown the necessity for a national system of education; the subject has indeed been so often spoken of in these pages, that we are almost ashamed to return to it. And yet perhaps the friends of a general system, conducted under the authority, and at the expense, of the state, never required to speak out with greater vigour. What we want may be told in a single sentence. We desire to see a system of national secular education, projected and maintained by the public, for the benefit of the whole people. We detest everything like sectarianism: it is the blight of every national improvement, and is keeping the people in ignorance. In order that government may, with propriety and justice to all, interfere on behalf of the public in this momentous question, it is our opinion that nothing beyond secular instruction on a broad principle should be given in the national schools; and that the religious portion of the instruction which is desirable, should be given separately by the clergy of the different denominations. Such we believe to be the form of educational belief entertained by every one who is governed by motives of impartiality, and really desires to see the people instructed. As for the proposal to educate the bulk of the poor by charitable subscriptions, or the voluntary principle, as it is called, we consider it to be worse than a fallacy.

But we are told that government has not the power to institute so broad a system as we desiderate. Perhaps such is the case, though we are inclined to think that a lack of courage to announce the principle is more conspicuous than a want of ability to carry it into execution. In the meantime, therefore, as nothing else seems possible, the country will make up its mind, to see either an endowed system of sectarian instruction, or see nothing. What is doing at present to educate the lower classes, is a perfect farce. Thousands on thousands get no education at all. England continues the laughing-stock of Europe—a country in which great principles are sacrificed, in order to please the fancies of time-servers and demagogues.

That education is desirable on a far more effective scale than that which now exists, is evident from the lately published minutes of the Committee of Council on Education. The two volumes of which these consist are composed from the reports of the various inspectors of schools, and it is from these that we gather information as to what is doing in the great work of educating the people.

The council have received applications during the year for aid from 518 places in England, Wales, and Scotland. Most of these are for the enlargement of school-houses, and the building of residences for the master or mistress, for 'repairs and fittings,' and in some instances for ventilation. Some of the memorials pray for the foundation of 'exhibitions' of L.10 and upwards, to stimulate the industry of the older scholars; and we learn by a circular that it is proposed to pay those

selected to qualify themselves as 'pupil teachers,' L.10 in the first year, L.13 in the second, and L.16 in the third. This is, however, in connection only with the London diocesan schools. Notwithstanding the general poverty of the population of Wales, we are informed that urgent demands are made for efficient schoolmasters and schoolmistresses; but as the salary is not more than L.25 per annum, 'there is no inducement for young persons possessing the requisite qualifications to offer themselves for the work.' According to the evidence, the only means of preventing the present schools from becoming 'worse than useless,' will be by the establishment of a model school, and a general increase of the salaries paid to the teachers.

The southern district comprehended in the counties of Berks, Bucks, Hants, Herts, Kent, Surrey, Sussex, and Wilts, contains three hundred and forty schools, visited by the inspector at an expense of L.2, 6s. 4d. for each school. At Upton, we read that the floor of the schools being of asphalt, the children suffer from chilblains in the winter. In others, the master is described as 'overtaxed,' or 'trusting too much to his monitors, instead of working himself,' or 'unnecessarily severe.' But by far the greater number of teachers are described as zealous and painstaking, and the schools generally as greatly improved since the visit of the previous year. Singing appears frequently as part of the course of instruction; and being pronounced 'good' in the majority of cases, shows the great value of this delightful accomplishment in the training of youth. Want of funds and of properly-trained teachers are, however, everywhere urged as the chief impediments in the way of diffusing a better and more comprehensive education among the people at large. 'The necessities of past times,' writes Mr Allan, 'familiarised the people to the notion that a few weeks' attendance at an organised school, where what was called "the National System" might be learned, was sufficient to transmute a decayed tradesman, with some knowledge of writing and accounts, into a national schoolmaster. But, happily, the conviction is daily gaining ground, that for a supply of well-qualified teachers, we must look to our training establishments, where they may remain long enough to have their characters moulded, and to receive that education in other respects which may fit them for their work.'

Another passage of this gentleman's report amply confirms the often-expressed opinion of the high value of music as a moral agent. 'Scarcely any school,' he observes, 'visited in my district, in which music is taught successfully, fails to rise to considerable eminence in other respects. The schools at Longparish and Farton, where great attention is paid to this art, and where it proves a powerful means of attaching the scholars to the church, are excellent specimens of a strong moral influence being exercised thereby. Our forefathers reckoned music among the seven liberal sciences; and I hope that we are making a considerable advance in the right direction, in bringing back into our schools an art which, under proper management, cultivates a certain delicacy of feeling and gentleness greatly needed by the children of the poor, making their tempers plastic, and contributing in various ways to harmony and order.'

In five counties in South Wales, the schoolmasters are described as 'imperfectly acquainted with English, and who have received little mental training of any kind. Some are discarded excisemen; some are broken-down tradesmen or beer-sellers; some have been soldiers or sailors, who, with a little skill in writing and figures, have picked up in their travels a little knowledge of English.' Many of them are habitually addicted to liquor, and frequently appear in public in a state of intoxication. What, however, can be expected, where the first question asked when a schoolmaster's post becomes vacant, is not 'Who is likely to fill the place best?' but 'Whose circumstances most need the emolument?' This low moral character shows itself in other respects—Of 15 schools visited in Radnorshire, only

3 were found to be provided with the outbuildings necessary for decency. As a portion of the church is, in Radnorshire, the most common place for school-keeping, the evils of such a deficiency appear in their most repulsive form. Where so little regard prevails for decency, it is not surprising there should be a want of morality. While the proportion of illegitimate births throughout England is estimated at 1 in 16, in Radnorshire it is 1 in 7 of the whole.

Mr Cook states, in his report of schools in the eastern district, that 'we not only lose our children at a very early age, without any systematic means, or indeed, for the most part, without any kind of means of keeping up an intercourse with them after leaving school, but that a fearfully large proportion of poor children either do not enter our schools at all, or remain in them so short a time, that any expectation of their receiving real benefit from the instruction therein given must be a mere illusion. It is true that so many schools have been established in which instruction, if not entirely gratuitous, is attainable at a trifling cost, that every parent who desires to secure the advantages of education for his child may find one in most quarters of London within a moderate distance; but it is equally true that thousands are either too indifferent, or too ignorant, or too vicious, or too little able to command their children, ever to avail themselves of the opportunity. One consequence of this want of elementary education, whether we consider it as a want of knowledge or of training, is admitted to be a frightful increase of depravity among pauper children. At the late Middlesex sessions, it was stated by Mr Sergeant Adams that no fewer than 500 children, between seven and twelve years of age, had been summarily convicted by the magistrates, within a comparatively short period, as reputed thieves. All that the magistrates could do, was to send these children to prison for six weeks, or two months; and when the poor creatures came out again, they were compelled to follow their former pursuits, because they were without any other means of obtaining subsistence.' We have on several occasions pointed out the remedies for this state of things in articles on schools in different parts of Scotland. It is to be hoped that by the establishment of Ragged Schools, and the measures contemplated by government, this juvenile substratum of society will be converted into moral and intelligent beings.

The Midland district includes the counties of Chester, Stafford, Derby, Nottingham, Lincoln, Leicester, Warwick, and Northampton. The number of schools visited by the inspector, Mr Moseley, was 247; and the aggregate number of children 13,381; of these 1 in 6 can read 'with tolerable ease and correctness,' 1 in 3 read easy narratives, and the remainder read letters and monosyllables. One in 4 were learning to write on paper, 4 in 15 were in the first four rules of arithmetic, 1 in 15 in the compound rules, while not more than 1 in 53 was acquainted with the rule of three, and 1 in 9 with geography. Mr Moseley objects strongly to the delegation of the master's authority to monitors. 'The whole time,' he observes, 'allowed out of the life of a poor child for its school-days is all too short, and it is daily decreasing. Nothing can be expected to be done unless the most powerful of the resources which the schoolmaster has at his command be brought to bear upon every moment of it. If his work be not taken in hand forthwith, not only will he have lost the most favourable season for it—that when the mind is most readily imbued—but the whole opportunity. I claim, therefore, as a privilege of the child, and as a paramount duty of the master, that his own individual culture of the child's mind, his own direct and personal labour upon it, should begin from the moment when the child first enters the school, and never be interrupted until it leaves it.'

We pass over the other reports, to come to those of Mr Gordon on education in the counties of Stirling, Clackmannan, Linlithgow, and Renfrew. Of the 166 schools under the parochial act, 18 are described as

insufficient in size, 12 insufficiently furnished, 6 wanting repair, and 15 imperfectly ventilated. Besides these, there are 102 non-parochial schools, 90 of which come under the above classification of imperfection. Of the school accommodation generally, it is observed, 'that the dimensions of the apartments in length and breadth, but more especially in height, are too often insufficient; and that, both in situation and structure, the means of securing proper ventilation are often wholly neglected. That the parochial schools are for the most part better provided in this respect than the act is understood to have required; and at the same time, that the school-houses which have originated in free gift are somewhat more numerous than those which have been produced at the command of the statute; still leaving, however, more than a third part of the whole number to be provided by the teachers themselves at their own expense.' Of the parochial schoolmasters, 10 receive an income of L.50 annually; 14 from L.50 to L.60; 8 from L.60 to L.70; 8 from L.70 to L.90; and 9 from L.90 to L.120. The population of the four counties is 233,156; and of the number of children frequenting the schools, 10,150 are taught reading, 3270 writing, 1200 grammar, and 1515 geography. 'In seventy of the schools, no instruction has been given or attempted in geography, solely for want of maps. . . . In the better schools, the large maps published by Messrs Johnstone and by Messrs Chambers are common. In some a small hand atlas is employed, which the teacher finds to have its advantages, as the pupils can be taught to point out places upon it without any direction from the sight of names—a mode of the same principle which has produced maps without names at all, or with only their initial letters. In a few instances the pupils have been well exercised in the construction of maps. But it scarcely ever happens that they are taught to trace an outline of countries on the board.' The general bearing of education in the four counties is said to be towards improvement. 'On the one hand, it receives a tendency to advance from ministers and presbyteries, and from many of the heritors and schoolmasters; but this is too often checked by increasing indifference to it among the people, especially those of the mining and manufacturing classes.'

Wherever we look, the same conclusion appears to be inevitable. To be really beneficial, the scope and aim of education must expand in proportion to the increasing wants of the age. It is now conceded on all hands that the only remedy for the evils of ignorance consists in education. Let it, then, be applied to the circumstances of the case in a broad and liberal spirit, and, although not over-sanguine as to immediate effects, we have no doubt whatever as to the ultimate result.

FORTUNE'S WANDERINGS IN CHINA.*

SOME few years ago, it was predicated that the 'Wanderings' now before the public would not only conduce greatly to the advancement of botanical science, but open new views of the Chinese character, and point out new fields for commercial intercourse. This of course heightened the interest with which we took up a volume on a subject so interesting in itself; and the introductory chapter was well calculated to raise expectation to a pitch of excitement.

The author begins by informing us that he is to be no common author; that he is to eschew the errors and absurdities of former writers; and that in his book will be found a picture of the Chinese as they are. This he does in such general and ambiguous terms, as to give one the idea either that his censure included the recent productions of Davis, Gutzlaff, and Medhurst, or that these contributions to our knowledge of China were too

trifling to require mention. The promise of this introduction, however, we are bound to say, is by no means fulfilled. The reader will here look in vain for new views of the Chinese character, or new materials for forming such views; and before closing the book, he will come to the conclusion that a man may be an excellent practical botanist (as Mr Fortune doubtless is), without possessing any extraordinary talent for observation on other subjects. The 'Wanderings,' in fact—always excepting the information they communicate in agriculture, gardening, and botany—are mere illustrations, though sufficiently agreeable illustrations, of what was already familiar to us from other sources; but they can lay no claim whatever to originality, or even to that vividness of description which sometimes compensates for the want of it.

In the discussion that has been carried on respecting the extent to which the soil of China is cultivated, Mr Fortune takes a part against the hypothesis which assumes that little more is left to be done—that any further increase of the population must depend for subsistence upon foreign supplies. This is perhaps one of the most important of all the subjects that relate to the destinies of the further East; for China has, for some time past, taken a part which attracts far less attention than it deserves in the history of these regions. This people, amounting in number to between three and four hundred millions, have long reached the point of starvation at which emigration becomes necessary. In vain were all things made to give way before agriculture. The flocks and herds, which formed the wealth of their ancestors, vanished, and the lands on which they had fed were turned into fields of grain. The profession of the husbandman was reckoned the most honourable, next to that of the literati; and the emperors set the example to their subjects, by holding the plough. But all would not do: and then rice was eagerly sought for in the neighbouring countries, and a large premium offered upon its importation in the shape of exemption from duties. Home production, however, and foreign imports, even in their union, were insufficient; and the masses of the people had recourse to anything and everything that could sustain animal life, however disgusting, however horrible to the appetite in other regions. Nay, the common substances which elsewhere form the food of human beings, were devoured by them in a state of decomposition, till the odour of putridity became a national taste. Thus the Chinese would seem to have arrived at the utmost edge of the circle within which nature confines the movement of population; and the fact is proved by the result. Emigration is not merely discouraged by the government—it is forbidden; but although it is treason to go, it is starvation to stay behind, and every year the excess of population from this vast country bursts in resistless surges over the neighbouring regions. Throughout Siam, Burmah, British Malacca, the Indian Archipelago, flows the ceaseless tide of a race whose fecundity is elsewhere without example in the human kind; and it is no wild speculation to suppose that the new empires of which the English have laid some faint foundations in Australia, will be mainly peopled by Chinese. Already they form one-half of the inhabitants in the great and thriving British settlement of Singapore.

Mr Fortune bestows no attention upon any such facts connected with the position of the people. He supposes, from the natural sterility of the hills, that a certain portion of the country is uncultivated; and this is true, since no cultivation in such places could be of any use. But he adds likewise the vague assertion (for his opportunities of observation in so vast a country were limited), that even in the most fertile mountain districts in Central China the greater part of the soil 'lies in a state of nature, and has never been disturbed by the hand of man.' This would appear to be quite incredible of any part of China, excepting perhaps the range of mountains which separate the provinces on the southern coast from those in the centre, and where, among the other

* *Three Years' Wanderings in the Northern Provinces of China, including a Visit to the Tea, Silk, and Cotton Countries: with an Account of the Agriculture and Horticulture of the Chinese, New Plants, &c.* By Robert Fortune. With Illustrations. London: John Murray. 1847.

wonderful anomalies presented by the empire, we find a people still unsubdued by the government! The Chinese, taking them generally, are a hard-working race; and the happy insensibility—or rather vitiation—of their olfactory nerves, has rendered them very learned in manures of all kinds. Stubble, fish, burnt earth and weeds, oil-cake, bones, shells, old lime, soot, ashes, and, above all, night-soil, are eagerly collected; and the horrible *manure tanks* of the cities are looked upon by all classes, rich and poor alike, with perfect complacency. Mr Fortune does not mention what is, in reality, a very important element in the fecundity of the fields—the shaving of about a hundred million beards and polls. In short, the state of the manure business alone among this singular people would seem to render it very improbable that they leave any considerable portion of fertile soil in a state of nature.

In general, the personal adventures with which Mr Fortune's narration is varied, are almost precisely similar to those that befell Mr Medhurst, when the pious missionary was traversing the coast, for the purpose of distributing religious books, in spite of the opposition of the authorities, and with or without the consent of the people. In both cases the two gentlemen pursued their several avocations (that of Mr Fortune being the search after new plants) in the face of a sometimes hostile population, and with a coolness which, taken with all the adjuncts of the picture, is not a little amusing. They went where they liked, they traversed towns and villages with equal impunity, they browbeat the mandarins, kept the people in order, and seldom came away without attaining their object. Mr Fortune, however, was on two occasions somewhat roughly handled; although this is not by any means so surprising as the fact of his escaping at all.

The Chinese are not only industrious, but highly teachable. At Chusan 'it was astonishing how quickly they got accustomed to our habits, and were able to supply all our wants. Bread baked in the English mode was soon exposed for sale in the shops, and even ready-made clothes were to be had in any quantity. The tailors flocked from all quarters: a large proportion of the shops near the beach were occupied by them; and they doubtless reaped a rich harvest, although they made and sold every article of dress on the most reasonable terms. Then there were curiosity-shops without number, containing josses or gods carved in bamboo or stone, incense burners, old bronzes, animals of strange forms, which only exist in the brains of the Chinese, and countless specimens of porcelain and pictures. Silk shops, too, were not wanting; and here were to be had beautiful pieces of manufactured silk, much cheaper and better than could be purchased in Canton. The embroidery in these shops was of the most elaborate and beautiful description, which must be seen before it can be appreciated: this the Chinese were making into articles, such as scarfs and aprons, for English ladies.

'The shopkeepers in Tinghae supposed an English name indispensable to the respectability of their shops and the success of their trade; and it was quite amusing to walk up the streets and read the different names which they had adopted under the advice and instruction of the soldiers and sailors to whom they had applied on the subject. There were "Stultz, tailor, from London;" "Buckmaster, tailor to the army and navy;" "Dominie Dobbs, the grocer;" "Squire Sam, porcelain merchant;" and the number of tradesmen "to Her Majesty" was very great, among whom one was "Tailor to Her Most Gracious Majesty Queen Victoria, and His Royal Highness Prince Albert, by appointment," and below the name was a single word, which I could not make out for some few seconds—*Uniforms of all descriptions*. Certificates from their customers were also in great request, and many of these were most laughable performances. The poor Chinese were never quite at their ease about these certificates, as they were so often hoaxed by the donors, and consequently were continually showing them to other customers, and asking

"What thing that paper talkie; can do, eh?" The answer was probably in this strain—"Oh yea, Fokei, this can do; only a little alteration more better." Poor Fokei runs and brings a pen, the little alteration is made, and it is needless to add that the thing is ten times more ridiculous than it was before.'

The following is a canal adventure:—'In China, the canal is the traveller's highway, and the boat is his carriage, and hence the absence of good roads and carriages in this country. Such a mode of conveyance is not without its advantages, however little we may think of it in England; for as the tide ebbs and flows through the interior for many miles, the boats proceed with considerable rapidity; the traveller, too, can sleep comfortably in his little cabin, which is, in fact, his house for the time being.

'The canal, after leaving Shanghai, leads in a northerly direction, inclining sometimes a little to the west; branches leading off in all directions over the country. Some very large towns and walled cities were passed on our route, at one of which, named *Cading*, we halted for the night just under the ramparts. I spread out my bed in my little cabin, and went to sleep rather early, intending to start betimes with the tide next morning, and get as far as possible during the ensuing day. But, as my countryman says,

"The best laid schemes of mice and men gang aft aglie,"

and I awoke during the night by the cool air blowing in upon my head through one of the windows of the boat, which I had shut before I went to rest. I jumped up immediately and looked out, and through the darkness I could discern that we were drifting down the canal with the tide, now coming in contact with some other boat, which had been fastened up like ourselves for the night, and now rubbing against the branches of trees which hung over the sides of the canal. I lost no time in awaking my servant and the boatmen, who rubbed their eyes with astonishment, and exclaimed that some robber must have boarded us. This had never struck me before; but when I called for a light, I found that all my clothes, English and Chinese, were gone. Our visitor, whoever he had been, after taking possession of all that the cabin contained, cut the rope by which we were fastened, and shoved us off into the centre of the canal, along which we had drifted a considerable way before I awoke. Fortunately for me, the few dollars I had with me were in my Chinese purse beneath my pillow.'

The winter habits of the people are worth noticing. 'As the winter approached, the weather became extremely cold, and in December and January the ice on the ponds and canals was of considerable thickness. The most attractive shops in the city now were the different clothing establishments, where all articles of wearing apparel were lined with skins of various kinds, many of them of the most costly description. The very poorest Chinese have always a warm jacket or cloak lined with sheep-skin, or padded with cotton, for the winter; and they cannot imagine how the Europeans can exist with the thin clothing they generally go about in. When the weather was cold, I used always to wear a stout warm greatcoat above my other dress, and yet the Chinese were continually feeling the thickness of my clothes, and telling me that surely I must feel cold. Their mode of keeping themselves comfortable in winter differs entirely from ours: they rarely or never think of using fires in their rooms for this purpose, but as the cold increases, they just put on another jacket or two, until they feel that the warmth of their bodies is not carried off faster than it is generated. As the raw, damp cold of morning gives way to the genial rays of noon, the upper coats are one by one thrown off, until evening, when they are again put on. In the spring months the upper garments are cast off by degrees; and when the summer arrives, the Chinese are found clad in thin dresses of cotton, or in the grass-cloth manufactured in the country. In the northern towns the ladies some-

times use a small brass stove, like a little oval basket, having the lid grated, to allow the charcoal to burn and the heat to escape; this they place upon their tables, or on the floor, for the purpose of warming the hands and feet. Nurses also carry these little stoves in their hands under the feet of the children. Such, however, is the thickness and warmth of their dresses, that it is only in the coldest weather they require them. Little children in winter are so covered up, that they look like bundles of clothes, nearly as broad as they are long; and when the padding is removed in warm weather, it is difficult to imagine that you see before you the same individuals.'

We must conclude with what Mr Fortune calls 'offerings to the gods.' The periodical offerings to the gods are very striking exhibitions to the stranger who looks upon them for the first time. When staying at Shanghai, in November 1844, I witnessed a most curious spectacle in the house where I was residing. It was a family offering to the gods. Early in the morning the principal hall in the house was set in order, a large table was placed in the centre, and shortly afterwards covered with small dishes filled with the various articles commonly used as food by the Chinese. All these were of the very best description that could be procured. After a certain time had elapsed, a number of candles were lighted, and columns of smoke and fragrant odours began to rise from the incense which was burning on the table. All the inmates of the house and their friends were clad in their best attire, and in turn came to *ko-tou*, or bow lowly and repeatedly in front of the table and the altar. The scene, although it was an idolatrous one, seemed to me to have something very impressive about it; and whilst I pitied the delusion of our host and his friends, I could not but admire their devotion. In a short time after this ceremony was completed, a large quantity of tinsel paper, made up in the form and shape of the ingots of Sycee silver common in China, was heaped on the floor in front of the tables; the burning incense was then taken from the table and placed in the midst of it, and the whole consumed together. By and by, when the gods were supposed to have finished their repast, all the articles of food were removed from the tables, cut up, and consumed by people connected with the family.

On another occasion, when at Ning-po, having been out some distance in the country, it was night, and dark before I reached the east gate of the city, near which I was lodged in the house of a Chinese merchant. The city gates were closed, but two or three loud knocks soon brought the warder, who instantly admitted me. I was now in the widest and finest street in the city, which seemed in a blaze of light, and unusually lively for any part of a Chinese town after nightfall. The sounds of music fell upon my ear—the gong, the drum, and the more plaintive and pleasing tones of several wind instruments. I was soon near enough to observe what was going on, and saw, at a glance, that it was a public offering to the gods, but far grander and more striking than I had before witnessed. The table was spread in the open street, and everything was on a large and expensive scale. Instead of small dishes, whole animals were sacrificed on the occasion. A pig was placed on one side of the table, and a sheep on the other; the former scraped clean in the usual way, and the latter skinned. The entrails of both were removed, and on each were placed some flowers, an onion, and a knife. The other parts of the table groaned with all the delicacies in common use amongst the respectable portion of the Chinese—such as fowls, ducks, numerous compound dishes, fruits, vegetables, and rice. Chairs were placed at one end of the table, on which the gods were supposed to sit during the meal, and chop-sticks were regularly laid at the sides of the different dishes. A blaze of light illuminated the whole place, and the smoke of the fragrant incense rose up into the air in wreaths. At intervals, the band struck up their favourite plaintive national airs; and altogether, the whole

scene was one of the strangest and most curious which it has ever been my lot to witness.'

We have a strong notion that these are not offerings to the gods, but to the *ghosts*. The Chinese are very attentive to their defunct friends, sending them liberal supplies of money, furniture, &c. (manufactured of gilt paper), and occasionally giving them grand entertainments similar to the above. There is one feast of the dead, in particular, to which all those destitute ghosts are invited who have no living relatives to take care of them. It occurs once a-year, by lamplight, and presents, as may be supposed, a most extraordinary scene.

Mr Fortune's error, if it be one, is caused by his habit of generalising. The above is a superstition of Buddhism, the least considerable of the three Chinese sects, but the only one which appears to have come in our traveller's way. His remarks on religion, therefore, must be understood to apply only to a small portion of the people. In like manner, his account of the warm clothing, and cheap and comfortable living, of the 'very poorest Chinese,' is so utterly at variance not only with the statements of former writers, but with the context of the recent history of the country, that it must be taken as referring to some special localities. Perhaps it is not irrelevant to such points to mention, that in three years spent among one of the most universally educated nations on the face of the earth—where the whole country is thrown into a periodical tumult, resembling a general election in England, by the public examination of the schools—Mr Fortune never once happened to detect a single Chinese in the act of reading!

DAVIE CAMPBELL.

AN INCIDENT OF THE LAST WAR.

A NUMBER of years ago, there lived in the small village of Duddingston, near Edinburgh, a family named Campbell, consisting of a man and his wife, who were considerably beyond middle life, and their only son, a boy of fourteen years of age. The Campbells had retired on a trifle realised in trade, and their only care now centered in their child, David. Davie, as they called him, was not an ill lad, but he was a little flighty and wilful, as most only sons are, from over-indulgence. In particular, it was somewhat grievous that he manifested a poor taste for learning, and greatly preferred playing with mimic boats on Duddingston Loch to attending the parish school. The truth was, Davie's young imagination had been fired with the ambition of being a sailor, in consequence of listening to tales of sea-life related by old Sandy McTaggart, now a jobbing gardener in the village, but in former days a mariner on board the British fleet.

Of course, like all boys who go crazy about a sea-life, Davie Campbell knew nothing of the hardships of the profession, and only looked to the supposed pleasures of sailing about the ocean, and seeing strange and distant parts of the globe. Accident effected what his parents never would have permitted. In company with old Sandy, he went on a little pleasure voyage on the Firth of Forth, and on landing at night at Leith, they were seized by a pressgang, and taken on board a war vessel lying in the roads. In the morning, when the age of Sandy was ascertained, he was dismissed; but Davie, it can scarcely be said against his will, was entered on the ship's books.

What a dreadful blow was this to the Campbells! Their only hope in life vanished. As soon as they came to their senses, they set off to Leith to make inquiries as to the ship, and, if possible, to bring home their son. Their excursion was useless. The ship was gone, and no one could tell whither. What a melancholy evening was that in the once happy cottage! The demon War had carried off its victim. But a long succession of melancholy days followed: three years elapsed, and yet not one word was received from the lost son. Had the unhappy pair possessed a reasonable knowledge of the

world, they might have found means to discover whether Davie was in the land of the living, and in what vessel he was rated. But they were simple in manners, and had little knowledge of business. Oppressed with their feelings of bereavement, they seem to have considered that no other means of discovering their lost son was open to them but that of personal inquiry. Confirmed in this idea, they actually at length set off on a pilgrimage in quest of their boy.

We are writing of an incident which occurred when the process of travelling was considerably different from what it is at present. The notion of the Campbells was, that they would somehow get intelligence of their son in London, and to the metropolis, therefore, they bent their way; taking places in a wagon, which was to perform the journey in little more than a fortnight. The way was long and dreary; but love and hope imparted a ray of cheerfulness to the travellers, and at last, with unabated determination, they arrived in the vast metropolis. Fortunately, the wagoner was an honest man, and before he left them, he saw them comfortably housed in a respectable though humble inn in the city, where they might recover from their fatigue before they commenced their search on the morrow. Scarcely had the itinerant venders of milk, water-cresses, and other necessaries and luxuries commenced their daily cries, than the old couple sallied forth, supporting each other's steps; and, by making numerous inquiries, at last found their way down to the river's side. Here, to their inexpressible disappointment, they discovered only a crowd of small schooners, brigs, and cutters, for it was in the neighbourhood of Billingsgate; and even they could discern that such were not the craft they could hope to find their son on board. They were told, however, that larger ships were moored lower down the river; so, after returning to their inn to breakfast, they once more set out in their search.

This time they reached a part of the river below the Tower of London, where the docks are now to be found. Here they saw a number of large ships; but when they asked if any of them were king's ships, some people laughed at them, others thought them silly, and scarcely deigned an answer; nor for a long time could they obtain any information to guide their proceedings. At last a seaman, who was standing on the quay chewing his quid, turned round as they were making inquiries of some other persons, and in good honest Scotch asked them what they wanted, telling them that the chances were that those they spoke to did not comprehend a word they said. The old people, highly delighted at finding a countryman, and one who appeared willing to assist them, were not long in explaining their wishes.

'If your son has gone on board a man-of-war, you will not find him here,' replied the honest sailor. 'You must seek for him at Portsmouth or Plymouth; but to tell you the truth, I don't see that you have much chance of finding him. A hundred to one that you may have to travel half round the world before you fall in with him. However, if you are determined to look after him, go down to one of those ports, and make inquiries on board all the ships there, and perhaps you may find some one who knows him.' So good did this advice appear to Campbell and his wife, that they determined to follow it, and thanking the Scotch sailor for his kindness, they immediately returned to their inn.

On making inquiries, they found that the Portsmouth van, which was to start the next morning, was full, but that there was one about to set off for Southampton—a town, they were told, on the sea close to Portsmouth; and as their geographical knowledge was not very extensive, they fancied that they were as likely to find their son at the one place as at the other. So eager were they to proceed, that on the same evening they commenced their journey.

In those times coaches occupied the best part of twenty-four hours in performing the journey between

London and Southampton, and light vans, as they were called, upwards of two days; so that the patience of the old couple was tried considerably before they reached the latter town. Eagerly they hurried down to the water's edge to look for a king's ship; but not one was to be seen in the harbour. Mournfully they stood gazing on the lovely expanse of the Southampton water; for they were strangers in a strange land, and there was no one to help them. Those were stirring times: there were few idlers on the quay to answer their questions; so they once more turned their steps to the inn where the van had deposited them. Here they found the driver, who, having a friend just about to start with his wagon for Poole, recommended them to go by it, as he affirmed that they were there more likely to find ships than at any other port.

'But we are wishing to go to a place called Portsmouth or Plymouth, where the big ships come,' said old Campbell.

'And Poole is on the way there,' answered the rascally wagoner, who, provided he got his fare, cared little for the inconvenience to which the old couple might be put. The result, at all events, was, that to Poole they went. Poole is a town in Dorsetshire, on the coast, close to Hampshire, and from it the high cliffs of the Isle of Wight at the entrance of the Solent are clearly seen. A river with low mud banks flows past it, but is not navigable for vessels of any size; so that when the anxious parents hurried down to the quay, they were again doomed to suffer the bitter pangs of disappointment.

Thinking that the nearer they got to the sea, the nearer they should be to him whom they sought, they walked on to the very end of the wharf extending along the side of the river, their eyes wandering over the blue shining waters of the Channel, now rippled over only by a gentle summer breeze from the north. While standing there, they were accosted by a fisherman whose boat was made fast to the quay.

'What are you looking after, master and mistress?' he asked.

'We want to find our son, sir—our only son—who is in some king's ship; but though we have already wandered many a weary mile, we have not yet met with any one who can tell us where he is to be found,' answered the dame.

'Well, it's no easy job you will have to find him among the hundreds of ships in the navy,' said the fisherman. 'But if you want to go on board a king's ship, there's one now just coming out by the Needle Passage, and mayhap you will find your son on board of her. Now, if you will give me ten shillings, I will run you alongside of her with this breeze in no time.'

'And is that truly a king's ship?' exclaimed the old people together, looking towards the spot to which the fisherman pointed. 'Heaven be praised if we should find our son on board of her!'

'There's no doubt about her being a king's ship, and a fine frigate to boot,' answered the fisherman; and in that respect he spoke the truth, though his only object in inducing them to embark was to get their money. Without for a moment considering the expense, and forgetting all their fears of the water, they eagerly took their seats in the boat, which was only just large enough to bear them safely; and the fisherman, loosening his sails, ran down the river, and shaped his course so as to cut off the frigate, which was standing close-hauled along the coast.

The frigate seen by our old friends was the *San Fiorenzo*, commanded by Sir Harry Burrard Neale, and was now on her way from Portsmouth to Weymouth to receive on board his Majesty King George III., of whom Sir Harry was most deservedly an especial favourite. The king was at that time residing at Weymouth, to enjoy the benefit of sea-air, when he constantly made short excursions on the water on board the *San Fiorenzo*. As Sir Harry was pacing the quarter-deck, conversing kindly with some of his officers, he observed,

some time after they had cleared the Needles, a small boat standing out to sea.

'Where can that fellow be running to?' he asked of his first lieutenant. 'Is he not making signals to us? Take your glass and see.'

'Yes, sir; there are two people in her waving to us,' answered the officer after glancing through his telescope.

'It will not delay us long,' observed Sir Harry partly to himself; 'so heave the ship to, Mr —, and we will see what it is they want.'

The main-topsail was accordingly thrown aback, and in two minutes more the boat with the old Campbells was alongside. A midshipman then hailed them, and asked them what they wanted.

Speaking both together, they endeavoured to explain themselves.

'What is it the people in the boat want?' asked Sir Harry.

'They are a man and a woman, and as far as I can make out, sir, they are asking for their son,' replied the midshipman.

'Let them come on board, and we will hear what they have to say,' said the kind-hearted captain; and with some little difficulty old Campbell and his wife were at length got on deck, and conducted aft to Sir Harry.

'For whom are you inquiring, my good people?' asked the captain.

'Our bairn, sir; our bairn!' answered the mother. 'For many a weary day have we been looking for him, and never have our eyes rested on his face since the fatal morning when he was carried off from Leith.'

'What is his name?' inquired Sir Harry.

'David, sir; David Campbell. He was called so after his father,' answered the old dame.

'We have a man of that name on board,' observed the first lieutenant to the captain. 'He is in the watch below.'

'Let him be called on deck,' said Sir Harry; 'and we will see if these good people acknowledge him as their son.'

The name was passed along the deck below, and in a minute a fine active youth was seen springing up the main-hatchway. A mother's eye was not to be deceived. It was her own David. 'It is—it is my ain bairn!' she cried, rushing forward to meet him; and regardless of the bystanders, before the youth had recognised her, to his utter astonishment she clasped him in her arms, and covered his cheek with kisses.

Little more need be said. The Poole fisherman was dismissed, and old Campbell and his wife were allowed to remain with their son till the ship again sailed from Weymouth. Satisfied that their son was well and happy, they returned with contented hearts to their cottage at Duddingston, where young David some time after paid them a visit, and employed his time so well, before he again went to sea, in learning to write, that they never again had to remain long in suspense as to his welfare.

Sir Harry Burrard Neale used frequently to narrate the extraordinary circumstance of the old couple, without the slightest clue to guide them, discovering their long-lost son on board his ship. Indeed the incident is so strange, that unless vouched for by some such authority, it could not possibly be believed.

BÉRANGER.

THE title of 'The Burns of France' has been given to Béranger, and delightfully accepted by him; but, with all due respect for the French poet, we must protest against it as inappropriate. Burns and Béranger are distinctly dissimilar in their works, and also in their genius. The one is a peasant-poet, the other a mechanic-poet; the one belongs to the country, the other to the town; the one appertains to the world and to time, the other to a nation and an epoch. Burns wooed

his Egeria in glens and groves; Béranger in streets and cafés. The pabulum of Burns's youthful genius was ballads and heroic stories; that of Béranger the French classics. Burns was disturbed only by the small polemics of rural society; while Béranger, from his very boyhood, was jostled by the stupendous events of the Revolution, the Empire, and the Restoration. Notwithstanding this difference, however, they both drew their inspiration from nature; they are both 'men of the people;' and they are both regarded with almost idolatrous affection by their countrymen.

Burns appeared at a time when he was required by the human mind. The cycle had gone round, and another great poet came to civilise and refine the spirits of men, by giving new forms and fresh energy to ideas of the beautiful and the true. Béranger was called forth by the requirements of his class and nation. The time had come when the whole social system was to be stirred up from the bottom, in order that the PEOPLE, for the first time in France, might struggle into their natural and appointed place. But the people had as yet no poetry. There was no music in the national literature which could awaken the echoes of the heart. Hence Béranger was necessary. He was the bard of the republic, whose province in the Revolution was to cast down 'the lofty rhyme,' and open Parnassus to the vulgar.

Béranger has always been found difficult to translate; and as years flow on, the difficulty will increase. To understand him, we must understand the epoch, the manners, the men; and when these become matters of history, their poet, too, will belong to the past. This, however, is a great destiny. It is only a master-mind which can identify itself with the age it belongs to, and enshrine itself for ever in its annals. But let us not be understood to say that there are none of the songs of Béranger which will live, and which deserve to live, independently of their epoch. There are many in this category, although they do not amount to any considerable proportion of his works; and it should be recollected that their eventual influence upon French literature will be still more important than the personal achievements of the individual.

We have pleasure in noticing a new translation of the songs of Béranger by Mr Anderson of Glasgow,* who has happily approached the spirit of the original, and, as respects previous versions, effected some improvements in point of taste. The only specimen we can afford room for gives a good idea of the style and spirit of the poet; but we copy it likewise for another object.

THE OLD VAGRANT.

Well, in this ditch I reach at last,
Old, weak, and tired, my closing day;
Folks say I've drunk, then hurry past;
Good! there's no pity thrown away.
Yet some across their shoulders glance;
Others a mite or two have thrown;
Nay, hasten on, you'll miss the dance;
Old vagrant, I can die alone!

Yes; here, of age, they'll say I'll die;
For hunger never kills of course.
How often for the workhouse I
Have sighed as for a last resource!
But filled each hospital I found,
So poor the people now are grown.
Ne'er nurse had I but the cold ground;
Old vagrant, there I'll die alone!

In youth, the artisans I prayed
For leave a useful craft to learn.
'We are but half employed,' they said;
'With us thy bread thou canst not earn.'
Ye rich, who still 'Go, work,' repeat,
Scrape from your board you gave, I own;
Stretched on your straw my sleep was sweet;
I curse not, but I die alone.

* Lyrical Poems by Pierre-Jean de Béranger; Selected and Translated by William Anderson. With a Biographical Notice by the Translator, revised by the Poet. Edinburgh: Sutherland and Knox. 1847.

I might have stolen, poor soul, 'tis true;
But no: I'll beg, and trust in God.
At most, the fruit I plucked, that grew
Over the hedges on my road.
Yet twenty times, by statute-book,
They barred me in their prisons lone;
I owned but sunlight—that they took.
Poor vagrant, I can die alone!

Oh, can the poor a country have?
What are to me your corn and wine;
Your industry; your armies brave;
Your parliaments, where statesmen shine!
When in your fields, seized by his power,
The stranger reaped what you had sown,
Like a true fool my eyes did shower.
Old vagrant, I shall die alone!

Why, as mere noxious reptiles viewed,
Men, do you crush us 'neath your heel?
Instruct our minds in what is good;
We'll labour for the public weal.
Saved from the storm 'neath leafy screen,
The worm, in time, an ant has grown;
I, too, your brother might have been;
Your enemy, I die alone!

If the above touching stanzas wanted the last one, they would resemble too closely the complaints of English philanthropists touching the oppression of classes: but Béranger goes more deeply into the real wrongs of the vagrant, and the real neglect of his 'superiors.' The unfortunate is a burden to himself, and a disgrace to his country, not because he has been left by the rich in a state of poverty, but in a state of ignorance. Ignorance is the mother of idleness, whose progeny is want and vice.

SEARCH FOR WIVES.

Where do men usually discover the women who afterwards become their wives? is a question we have occasionally heard discussed; and the result invariably come to is worth mentioning to our young-lady readers. Chance has much to do in the affair; but then there are important governing circumstances. It is certain that few men make a selection from ball-rooms, or any other places of public gaiety; and nearly as few are influenced by what may be called showing off in streets, or by any allurements of dress. Our conviction is, that ninety-nine hundredths of all the finery with which women decorate, or load their persons, go for nothing, as far as husband-catching is concerned. Where and how, then, do men find their wives? In the quiet homes of their parents or guardians—at the fireside, where the domestic graces and feelings are alone demonstrated. These are the charms which most surely attract the high as well as the humble. Against these, all the finery and airs in the world sink into insignificance. We shall illustrate this by an anecdote, which, though not new, will not be the worse for being again told. In the year 1773, Peter Burrell, Esq. of Beckenham, in Kent, whose health was rapidly declining, was advised by his physicians to go to Spa for the recovery of his health. His daughters feared that those who had only motives entirely mercenary would not pay him that attention which he might expect from those who, from duty and affection united, would feel the greatest pleasure in ministering to his ease and comfort: they therefore resolved to accompany him. They proved that it was not a spirit of dissipation and gaiety that led them to Spa, for they were not to be seen in any of the gay and fashionable circles: they were never out of their father's company, and never stirred from home except to attend him, either to take the air, or drink the waters: in a word, they lived a most reclusive life in the midst of a town then the resort of the most illustrious and fashionable personages of Europe. This exemplary attention to their father procured these three amiable sisters the admiration of all the English at Spa, and was the cause of their elevation to that rank in life to which their merits gave them so just a title. They all were married to noblemen—one to the Earl of Beverley, another to the Duke of Hamilton, and afterwards to the Marquis of Exeter, and a third to the Duke of Northumberland. And it is justice to them to say that they reflected honour on their rank, rather than derived any from it.

THE OLD CHURCH.

I stood within those ancient walls: time's ruthless sway I felt—
The curtained niche was still unchanged wherein my childhood knelt;
Where girlhood's thoughts of vanity roamed from the sacred shrine—
Oh memories how full and deep through this changed heart of mine!

Before that solemn altar my young sister knelt a bride;
I viewed the gallant company with childish glee and pride;
With wreaths of fairy roses, and tears so strangely springing,
I sported down the sombre aisles while marriage peals were ringing.

And again at that old altar, in the spring-time of my youth,
Robed in the mystic veil, I heard confirmed my vows of truth:
'Mid bands of young companions, and hand in hand with one,
Whose sweetness even then was doomed—whose death-call forth had gone.

Within those sacred walls I knelt a newly-wedded wife,
With girlhood's smiles yet lingering, and hope still charming life:
The old familiar faces! that looked good-by with pain,
May never gaze on my changed brow, nor I on theirs again!

And now within this noble pile, once, once again I kneel—
Father! 'tis thou alone canst know the pangs thy creatures feel:
Fond memories are clinging fast, dark shadows claim their way:
Long years have passed—one vivid dream—since childhood's care-less day!

All is unchanged within these walls, all as in days of yore;
And so 'twill be in future years, when I shall be no more:
And plaints as mournful as my own, from living lips that come,
Will sound, old church, along thy aisles, like voices from the tomb!

C. A. M. W.

WHOLESALE INFANTICIDE IN MANCHESTER.

Here, in the most advanced nation of Europe—in one of the largest towns of England—in the midst of a population unmatched for its energy, industry, manufacturing skill—in Manchester, the centre of a victorious agitation for commercial freedom—aspiring to literary culture—where Percival wrote, and Dalton lived—thirteen thousand three hundred and sixty-two children perish in seven years over and above the mortality natural to mankind! These little children, brought up in unclean dwellings and impure streets, were left alone long days by their mothers to breathe the subtle, sickly vapours—soothed by opium, a more cursed distillation than hellebore—and when assailed by mortal diseases, their stomachs torn, their bodies convulsed, their brains bewildered, left to die without medical aid, which, like hope, should 'come to all'—the skilled medical man never being called in at all, or only summoned to witness the death, and sanction the funeral.—*Report of the Registrar-General for the quarter ending Sept. 30, 1846.*

WHAT A MERCHANT SHOULD BE.

A merchant should be an honourable man. Although a man cannot be an honourable man without being an honest man, yet a man may be strictly honest without being honourable. Honesty refers to pecuniary affairs; honour refers to the principles and feelings. You may pay your debts punctually, you may defraud no man, and yet you may act dishonourably. You act dishonourably when you give your correspondents a worse opinion of your rivals in trade than you know they deserve. You act dishonourably when you sell your commodities at less than their real value, in order to get away your neighbours' customers. You act dishonourably when you purchase at higher than the market price, in order that you may raise the market upon another buyer. You act dishonourably when you draw accommodation bills, and pass them to your banker for discount, as if they arose out of real transactions. You act dishonourably in every case wherein your external conduct is at variance with your real opinions. You act dishonourably if, when carrying on a prosperous trade, you do not allow your servants and assistants, through whose exertions you obtain your success, to participate in your prosperity. You act dishonourably if, after you have become rich, you are unmindful of the favours you received when poor. In all these cases there may be no intentional fraud. It may not be dishonest, but it is dishonourable, conduct.—*Gilbart—Lectures on Ancient Commerce.*

GREAT CALAMITIES.

WHEN a small calamity occurs, there is seldom, amongst the well-informed, any inclination to regard it as otherwise than an event in the natural procedure of the world—something which possibly human intelligence and foresight may prevent from recurring. For instance, if a ship sinks through faulty construction, we usually look to that bad construction as the cause, and think that such incidents may be made less frequent if we resort to better modes of building. Or if one has caught a severe disease from the malaria of stagnant water, we generally attack the malaria as the cause, and seek to avoid such evils in future by promoting drainage. When, however, a calamity on an extensive scale takes place, such as the failure of a great department of human food, or a pestilence (too often these are essentially one calamity), the general inclination seems to be to regard it as an immediate demonstration of Divine wrath, designed as a chastisement for some particular moral errors. There is no reason for this, beyond the comparative wonderment which a grand event excites. It is merely that, in the one case, we calmly proceed upon the common philosophy which experience and observation have given us; in the other, we are carried by the excitement of our feelings into the region of an inferior and more childish judgment. Usually, a very little consideration would serve to show the great and insuperable objections there are to the latter idea: as, the non-relation of the event to the occurrence of any unusual acts of turpitude; the falling of the calamity upon the classes perhaps the most innocent; and so forth. But wonderment stops not to think: it is content to dream, and to let calamities pass, as without a true reading, so also without a true improvement.

There is, in reality, except in the matter of magnitude, not the least difference between a great and a small calamity. In all of them alike there is a divine meaning and purpose; but it is strictly one meaning and purpose. That God conducts the affairs of the world by fixed arrangements, needs not in our day to be insisted on. Calamities are events incidental to, and inseparable from, the plan; they all occur, to use common language, in the course of nature. How a benevolent Deity should have permitted a feature which we feel to be so grievous, surpasses our power to find out; but there is no mystery in the philosophy of human conduct with regard to evils of all kinds. After a humble contemplation of the authority which has—no doubt for wise purposes—permitted them, it is no more than obeying one of the simplest natural impulses to study them, to do what in us lies to remedy them, and to seek to reduce and avert them for the future. Often we may view in them the natural result of errors we

have committed through ignorance, or selfishness, or perverseness. In such cases, the regard we pay to them should of course be accompanied by moral emotions of a suitable character. Beyond this, passive submission is mere ignorance or supineness—either a want of knowledge to discern the nature of the chastisement inflicted, or a want of moral courage to perform the duties necessary to its future prevention.

An extensive failure of crops—the very kind of calamity which has given us the word—is perhaps the worst which we know. It is one which has inflicted tremendous sufferings upon the human race, and which has not yet taken its place amongst extinct things. But such calamities are, after all, of a limited nature, and liable to correction by expedients within our power.

All herbage is subject to injuries from causes open to scrutiny, and remediable to an indefinite extent. It belongs to human ingenuity and industry to search out and limit the operation of these causes. And man is actually at all times advancing in the attainment of means for so trimming and arranging nature, as to make the results he desires in the vegetable creation the more certain. It is common to indulge in a despondent tone regarding blights and mildews, as if they were beyond all human remedy. It is a false tone, tending, like all false things, to bad conclusions. In reality, the progress which has been made in penetrating the secrets of nature, gives the strongest reason to expect that we shall in time discover all the influences affecting vegetation; and it seems but fair to conclude, that to be hopeful on this subject, is favourable to the end in view.

Vegetation seldom fails over several great regions of the earth at once. Its failure in one would obviously be of little consequence, if nations were on such terms with each other as to make mutual supply easy. Why they are not on such terms with each other, is because of the prevalence of jealous, selfish, and illiberal feelings. While we acknowledge, then, that such feelings exist, is it not equally evident that the dependence on each other for succour in case of light harvests, is an indication, as it were, by the finger of God himself, that such feelings ought not to exist, but be replaced by those of a kindly and social nature? Here is a reading of the Divinity in calamity—a reading of the true kind. Let the war of weapons, and the perhaps more mischievous war of 'duties,' cease; let peace and tolerance take the place of irritation and religious and social prejudices; and we take precautions against everything like local famines.

It might happen that an almost universal crop-failure took place, though we know of no instance in past times. In anticipation of such a calamity, there is no reason why a more extensive reserving of grain should not take place. The world is perhaps at all times too silen-

derly provided with food. It might be well to keep in store greater quantities, and thus equalise at least the pressure of bad seasons, if not secure us against anything like universal famine. Every provident man lays aside some portion of his present earnings as a resource against future contingencies; and why should not the principle which we applaud in *one*, be extended to communities and nations?

Thus it appears that the calamity referred to as above all others the greatest, might be averted by means within the scope of human power. What, then, is the just view to be taken of any actual occurrence of famine from the failure of crops? Simply, that we have suffered in consequence of defective knowledge—that endless cause of inconvenience and trouble to man—in consequence of our social arrangements being imperfect, or through a want of precaution and providence. Let the causes be removed, and the effect will of course be known no more.

The penal character of calamities is perhaps their most striking and important aspect. Nature's correctives they are, all of them, for the neglect or transgression of her appointments. It is particularly interesting to observe such as come as the punishment of moral errors on the part of great societies. The pestilence usually arises among the masses of the wretched, and spreads to the affluent. It may be said many then perish who have not failed to any signal extent in observing the rules of health; but while health has been attended to, social mischiefs have been left unremedied; hence the evil has arisen. The meaning of such pronouncements from the Divine Conductor of the world, is nothing more or less than this—Ye rich have failed in your duty to your humble brethren, and behold for this ye die. What ought the rich to have done? It is a nice and difficult question; but it is easy to see that something is wanting in our social arrangements with regard to the less fortunate parts of communities. The system of individual interests is so far well; it seems to be the means of eliciting many of the brightest features of human character; and no doubt independence is a noble word. But it is a system by which many are, as it were, thrown out. It seems to give advantages to some, to the overpowering and thrusting aside of the rest. God seems to have designed that we should go along more hand in hand together; at the least, it is evident that great relaxations and interdiffusions of means are called for, that all may be tolerably well. Even where moral power fails, those who possess it in good store are bound to use it to awaken, persuade, support, and stimulate the infirm brother. The laws of true society appear, in short, to demand great mutual care and helpfulness, as a supplementary force to self-helpfulness—not in anyway to supersede it. If so, then are all great concentrations of misery evils for which society is chargeable, and for which pestilence, as well as crime, and every other resultant evil, is only the appointed punishment. Here, too, it may be said, let the causes be removed, and the effect will cease.

There is an essentially religious character in the whole of these considerations. The humble and attentive man sees the Divine will and power in calamity, as in every other part of the universal plan. He watches it as a pupil watches for the meaning of a teacher, or a servant for the command of a master—with the design of profiting by, and obeying it. Regarded as a chastisement for error, he yields to it as no more than just, and then he turns contritely to the work which he sees before him for the improvement of the future. Let us so con-

template the public calamities of our time. Let us so resign ourselves to the penalties they impose; and so betake ourselves to the duty which they place before us.

A COMEDY IN A COURTYARD.

IN an ancient and gloomy court which existed a few years ago in the heart of Paris, there formerly resided an old public scrivener, known under the name of Monsieur Gant. He inhabited a narrow wooden mansion of great antiquity, which stood in a shady corner of the court, near a stone fountain, half-way between a washerwoman's tubs and an applewoman's stall. A faded curtain interposed its dusty texture betwixt M. Gant's window and the vulgar gaze, whilst, by a neatly-written bill, fixed with wafers to a pane of glass, the scrivener modestly informed the public of his readiness to indite or copy out epistles in the French language, at a very moderate price.

The personal appearance of M. Gant was by no means remarkable. He was a thin, withered little man, who looked as though he had formerly been much larger, but had since shrunk through some unaccountable process. His character was a strange compound of simplicity and punctilio. He had a great opinion of his own sagacity and depth, was vain of his little learning, and, by a whimsical contradiction, loved to think himself haughty and implacable, whilst he was in reality the most simple and easy of good-natured beings. During the daytime, M. Gant was to be found in his wooden box, waiting with exemplary patience for the arrival of customers, who seldom made their appearance, and perusing a favourite copy of his favourite Cornelius Nepos; 'a work,' he often observed, gravely shaking his head, 'of thrilling interest.' In the evenings, when his box was locked up, he repaired to the house of Sergeant Huron, an old friend of his, whose formidable stature, gray mustache, and blustering ways, offered the greatest contrast to M. Gant's studied solemnity of manner. They had been brought up together, and this was the cause of their friendship; otherwise they had few sympathies in common: the scrivener was pedantic in his speech, whilst the old soldier's conversation and ideas never seemed to extend beyond Napoleon and his own exploits. Still they agreed very well upon the whole; and they were not only friends, but very sincere ones.

But if the scrivener had a friend, he also had that bane of life—an enemy. His foe was no other than the applewoman whose stall stood in close proximity to his box, most impudently obstructing the passage to his door, and sometimes actually shutting him in. The mistress of the stall was a stout fiery-faced little woman, with a thick, hoarse voice, which became startlingly shrill when she was at all excited, and bead-like eyes, beneath whose fixity of stare it was averred that M. Gant himself had quailed; although the truth is, that, being a dauntless little man, he cared not a pin for her. Why they were foes, it would be hard to tell; yet they both felt that they were so; at least M. Gant, though incapable of the feeling, thought he hated the applewoman, who most cordially hated him. It would be tedious to relate by how many methods she sought to annoy the scrivener. But all her attacks proved unavailing: he did not even condescend to answer her most bitter taunts; he literally crushed her with the weight of his contempt.

The fact was, that owing to a certain philosophy, either constitutional or acquired, M. Gant could not be long teased by anything, and somehow or other the applewoman's most artful contrivances to vex him generally added to his comfort or pleasure in the end. One sore blow, however, she contrived to inflict, and this was by persuading a cobbler of her acquaintance to come and fix his abode in the court, exactly opposite the scrivener's box. Though he apparently remained indifferent to this attack, M. Gant was really an-

noyed at what he sententionally termed 'the audacious encroachments of the vulgar;' and what so thoroughly vulgar as the smell of leather? he observed, when relating the event to his friend. Sergeant Huron, who was always for carrying matters in a kind of military way, volunteered to go and make a few gentle remonstrances to the cobbler; but this offer the scrivener prudently declined, couching the motives of his refusal in a Latin quotation on the violence of warlike Mars. The cobbler's shed—which, as M. Gant indignantly declared, consisted of mud, wood, and plaster—was erected in the space of a few days, and pronounced ready to receive its new tenants, who accordingly hastened to remove to it. This important event took place on a fine summer's morning, when M. Gant, who had just seated himself before his desk, could look on the whole proceedings. A small wheelbarrow or hand-cart, drawn by a man with a very black face, and followed by a woman blacker still, first made its appearance. A cradle, which was to be swung from the roof of the shed, a dirty board, destined to act as table, a couple of bottomless chairs, a saucepan, and a washing-tub, were successively taken out of the truck and placed in the shed; the care of the whole, besides that of the truck, at the bottom of which still remained some crockery, being confided to the cobbler's eldest son, a boy of seven or eight, whose parents, having more things to bring to their new abode, now left alone, with strong recommendations not to touch a certain pot of dripping, which it seems was also in the cart. It is well known what wonderful uses the French of the poorer classes make of dripping: in fact they live upon it. They take it in the morning, diluted with warm water, under the name of soup; spread it, for lunch, on their bread instead of butter; eat it again as soup in the evening; and apply it to various other purposes with most praiseworthy ingenuity.

How it happened we will not venture to say; but when the cobbler and his wife came back, they found their eldest son in a singularly awkward position. The dripping-pot was a very deep narrow one—an earthen marmite, that did not look much unlike a helmet. Whether this resemblance struck the fancy of young Louis, or whether he was impelled by a natural taste for dripping, would be difficult to determine; but certain it is that his parents found him sitting in the truck, and, to their unutterable dismay, with his head snugly ensconced in the dripping-pot. To see how it had got in, was easy enough; but to say how it was likely to get out again, was a more difficult task. The cobbler flew into a terrible passion: he bade Louis take his head out that very instant, and prepare for a sound whipping the next. The unfortunate Louis endeavoured to obey the first part of this injunction. His mother pulled at the pot, and he pulled, and all pulled; but it was of no use—off it would not come. The cobbler had promised his son a thrashing when the pot should be off; he now determined to give it him first, and wrathfully advanced to seize upon him; but hoodwinked as he was, Louis guessed his intention. He rapidly darted towards the top of the truck, which as suddenly flew to the ground: Louis lost his balance, and in a second down he rolled with the dripping-pot, and over him the truck with all its contents.

The scene that ensued—for the cobbler's other two children, who were now arrived, joined in the cry—no pen can describe: suffice it to say, that there was not a saucepan but was considerably damaged, nor a plate that was not broken. When picked up by his alarmed mother, Louis was found completely unshelled, very little injured, but somewhat scratched and bedaubed with dripping to an extraordinary degree. Such were the incidents which marked the cobbler's removal to the court, and on which M. Gant looked with high indignation, anticipating the most unpleasant consequences from such a neighbourhood. Yet strange to say, this impression soon wore off. The cobbler was a merry industrious man, who sang and worked all the

day long; whilst his wife, as industriously engaged, sewed, washed, and cooked—all in the shed—and accompanied her husband's strains by scolding her three unruly children. Still they were, upon the whole, a happy, good-humoured, and simple family, who won so much upon M. Gant's affections by the unbounded deference they paid him, that he began in time to like the cobbler's merry songs, the noise and romping of his children, and even the scolding of their mother. It was, besides, very pleasant for a philosopher like him to watch daily the household concerns of the simple people of the shed, who with the greatest candour and *naïveté* laid open to his view every incident of joy or wo in their humble existence. He thus, unconsciously to them, and without ever having addressed them, became the partner of their little trials, and the unknown sharer of their mirth. He watched the children growing up, and the parents growing gray. A certain screaming baby, called Marianne, who had long annoyed him, became in time a pretty laughing child, and then a blushing maiden, on whom he loved to gaze; Louis of the dripping-pot assumed quite a manly air, and, owing to his cheerfulness and good-temper, was M. Gant's especial favourite; and thus the most formidable attempt which the applewoman had yet made against the scrivener's peace of mind, turned out like all the rest, and literally added to his pleasure and happiness. Seeing that he was really invulnerable, his enemy at last gave him a short respite, and, intrenched behind her stall, silently brooded over her defeat.

When Louis, who was now a journeyman carpenter, was somewhere in his twenty-second year, M. Gant began to observe what had been visible to all the inhabitants of the court for several years; namely, that the young man carried on a kind of sentimental flirtation with the washerwoman's daughter, Angélique, a girl of eighteen, very pretty, and very capricious, but withal very charming. It was a great source of pleasure to M. Gant to observe the progress of their simple courtship. At first Louis, when coming home from his work in the evening, would loiter at the fountain; and whilst the good housewives of the court, Angélique's mother among the rest, were filling their buckets with water, and chatting together, he would address a few insignificant phrases to the young girl, and retire quite satisfied with her coy and monosyllabic answers. Gradually, however, he grew more bold and confident. Angélique had a pretty voice and a good ear, the result of which was, that she sang all the day long, to the scrivener's infinite gratification, and the applewoman's consequent annoyance. With the view of indulging her taste, Louis brought her home all the songs he could procure; then he taught her the tunes; and at last he sang them with her in the cool summer evenings, until the whole court gathered around them; for, to say the truth, Louis never saw Angélique but on the threshold of her mother's door. Several months had thus elapsed, when, as the conclusion of the whole affair was evidently drawing near, M. Gant uneasily noticed certain symptoms of change in the demeanour of the lovers. One evening Louis, contrary to his usual custom, came not to the meeting: the next day Angélique received him with such evident coldness, that he retired earlier than usual. On the following evening Louis came home from his work somewhat later, and, without going near Angélique, paused for a few seconds at the fountain: on seeing him, she hastily entered her mother's house, and closed the door. The next day the young carpenter did not even approach the washerwoman's abode, though the scrivener caught a glimpse of him in the court. Several days elapsed, and yet there was no change on either side: the lovers only became cooler and cooler, until, at the end of a week, they seemed totally estranged.

M. Gant saw this, and grew sad: he had been cheered a while by the sight of their simple courtship; he had loved to watch its progress evening after evening, and be the unseen witness of many little circum-

stances which had escaped the vulgar gaze; and now those in whom he had felt such a deep interest grew, like the world, indifferent and cold, depriving him of one of his few remaining pleasures. The scrivener's only comfort was, as usual, to pour his sorrows into Sergeant Huron's friendly bosom. The old soldier, who was somewhat hasty, immediately offered to go and speak to Louis and Angélique, averring he could make everything right in a few minutes; but M. Gant, reminding him that lovers' quarrels were best let alone, with some difficulty induced him to give up the idea.

One evening, when M. Gant, who had grown quite misanthropic, was bitterly ruminating in the solitude of his wooden mansion, he was startled by a knock at his door. He opened, and Louis entered. The scrivener eyed him with silent surprise, whilst the young man, unconscious of the feeling he excited, laid on his desk a small slip of paper, which he briefly requested him to correct and copy out. Merely signing him to be seated, M. Gant put on his spectacles, and read the paper attentively. It was a rude scrawl, in which the young carpenter had somewhat imperfectly expressed his feelings. Its incoherence did not, however, much astonish M. Gant; for he was accustomed to love-letters—we need scarcely say this was one—but he paid more attention to its general purport. Louis, strong in conscious innocence, appealed to Angélique's heart, cautiously avoiding to mention her name, however—a needless piece of discretion, which made M. Gant smile inwardly—demanded to know his error, if indeed he had committed any; and after beginning by asserting that he was ready to forget her for ever if she wished, he ended with a most passionate protestation of eternal love.

M. Gant was a judge of the human heart. He saw that the letter, with all its incoherence, was a good one: for it was true. He therefore merely corrected the spelling, and copied it out; and when it was finished, he handed it to Louis, who, placing a franc on his desk, thanked him and retired. The scrivener saw him depart with a melancholy glance; for one of the two beings whose fate had of late been his chief concern looked upon him as on a stranger. Still his interest in Louis and Angélique was not diminished; and it was with the utmost impatience that he waited for the next evening, in order to see the effect the letter had produced. The lovers met, seemingly by chance, as usual, near the stone fountain. Louis timidly approached the young girl, and whispered something in her ear; but she scornfully drew back, and with a toss of her head, retired to her mother's shop. Louis looked sadly after her, still standing rooted to the same spot, until the stifled giggling of some mischievous girls near the fountain aroused him from his trance. Suddenly starting, he cast an indignant glance around him, and hastened to depart, apparently much mortified by Angélique's contemptuous treatment.

'What could all this mean?' Such was the scrivener's thought, when the unexpected entrance into his lodge of a woman, wrapped up in a coarse dark shawl, awakened him from his reverie. He turned with surprise towards the new-comer; but notwithstanding her disguise, a glance was enough to let him know that Angélique stood before him. As soon as the door was closed upon her, she sat down, and without attempting to conceal her person any longer, she said in a proud and firm tone, 'Monsieur Gant, I am come to ask you to render me a service. I received yesterday this letter'—and she laid Louis's epistle on the desk—from a person with whom I wish to hold no further correspondence. Will you please to tell him so in my name?'

M. Gant took up his pen; a sheet of letter-paper was before him; he placed his hand upon it, as though to write; but laid it down again, and calmly said, 'Why not tell him as much yourself, mademoiselle? You see him every day.'

'Because I do not wish to speak to him any more, sir,' she indignantly answered.

'Or perhaps you are unable to write yourself?' hinted the scrivener.

Angélique frowned, and looked displeased. 'I know how to write, sir,' she stiffly replied; 'but since he has chosen to apply to you to write to me, I shall answer him in the same manner.'

'And who told you that it was I who wrote this letter?' asked M. Gant, turning inquiringly towards her; 'for if you know that, I know that you were out yesterday.'

Angélique coloured, but evasively answered, 'Monsieur Gant, if you do not wish to write this letter, pray say so at once?'

'Nay,' said the scrivener, as she rose to depart, 'since you are determined to be miserable, I shall no longer seek to prevent you.'

And so saying, he once more took hold of his pen, and in a few brief words, as severe as Angélique could wish them to be, he intimated to poor Louis that the capricious beauty cared for neither his repentance nor for his most passionate protestations. When he had finished his task, M. Gant handed the letter to the young girl, watching her features, in the hope of seeing them betray some compunction for the severity of his expressions. But far from it: she seemed highly delighted with the epistle, thanked him very warmly, liberally remunerated him for his trouble, and left him sadder than ever, and in a bitter mood of invective against girls, their lovers, and human nature in general. 'For,' he observed, when he was left alone with his own thoughts, 'it is easy to see how thoroughly bad human nature is, since those young people, who have known each other from their childhood, who have been lovers for years, now part for ever, not only without a pang, but even with joy; and, in all probability, owing to some mere trifle that has come between them.'

Now, although he could not possibly imagine what this important trifle was, M. Gant had his own private suspicions concerning his spiteful little neighbour the applewoman, to whom he was indeed in the habit of referring every evil that occurred. It was evident that some mischievous person had informed Angélique of Louis's visit to him, a step not unlikely to prejudice him in her eyes; but then there existed no proof that this fact had been revealed to the young girl by the applewoman; and though he narrowly scanned her features more than once, M. Gant could discover in them none of the malicious triumph which generally betrayed her when she had been engaged on some work of mischief. She was apparently calm, and wholly unconscious of what was going on. The next day passed, and nothing occurred, save that in the evening Louis came home from his work seemingly much disheartened, so that the scrivener, who was very fidgetty, and constantly on the look-out, concluded that he had received Angélique's letter. On the following morning, as he sat at an early hour in his box, he noticed Louis in a remote corner of the court engaged in a mysterious conference with his pretty sister Marianne. M. Gant easily guessed the subject of their conversation; and as Marianne was not only cheerful and good-tempered, but also possessed of much intuitive tact, and stood, moreover, on friendly terms with Angélique, he augured success from her interposition, and impatiently waited for its result. But Marianne was a real diplomatist; and instead of injudiciously hurrying to perform her delicate errand, she loitered about the court, now entering, now leaving her father's shed with a most unconcerned air. It was not until the afternoon was far advanced, that the scrivener saw her at length proceeding towards the washerwoman's shop. She could not have chosen a more unlucky moment; for Angélique, who was ironing in a little back parlour, was also there, entertaining a sentimental young tailor, laughing and chatting with him very merrily. Now this young man, who lived in the court, had formerly paid no little attention to Marianne, who, when teased on the subject, very seriously averred that 'she did not

care for him; indeed she did not!' Nevertheless, when she entered the parlour, and saw how thoroughly poor Louis was slighted, and for whom, all her sisterly feelings were aroused, and she felt so indignant at Angélique's coquetry, that she could scarcely contain herself. In short, she threw out such hints, that ere long the young tailor prudently departed; whilst Angélique, who was not very patient, retorted in so high a strain, that Marianne fairly lost her temper, and flounced out of the room in a state of great indignation. Though M. Gant saw nothing of this, he conjectured, by the young tailor's retreat, and Marianne's agitation, that the ambassadress had failed, a surmise which was confirmed by Louis's behaviour on the next morning; for as he was entering his wooden box, the young man followed him in, and requested him to transcribe the following laconic epistle:—'Mademoiselle—You tell me to forget you. I will obey you as soon as I can. Farewell. Louis.'

On the evening of the same day, the following answer was dictated by Angélique to the scrivener:—'The sooner you forget me, the better. ANGÉLIQUE.'

'And now,' pettishly observed M. Gant when she had retired, 'I suppose that fine correspondence of theirs, by means of which they contrived to keep me in hot water for the last week, is over at length.' But the scrivener evidently did not understand such matters; for although there was a kind of two days' truce, during which Louis went early to his work, and came home late, never once approaching the old stone fountain—near which Angélique openly flirted with the young tailor—it was evident, by the attitude of both parties, that things could not last long as they were. On the evening of the third day, Louis entered M. Gant's box in a state of great agitation. 'Monsieur Gant,' he exclaimed, 'this is more than human flesh and blood can endure, and you must tell her so!'

'Oh, you have not forgotten her yet?' ironically observed the scrivener. But Louis cared not for irony: he was desperate; he had just caught a glimpse of Angélique seated in her mother's shop with his rival, and his overcharged heart poured itself forth in a torrent of eloquent reproaches, which he charged M. Gant to commit to paper, never once reflecting that the scrivener could not possibly recollect as much as the one-tenth of what he was saying. M. Gant did not make the attempt; he let the young man speak away, conjecturing it would relieve him, and do him good; and in the meanwhile he cast a stern and angry glance towards the spot where Angélique was sitting with the tailor. To the scrivener's satisfaction, the young man rose to depart. Angélique tried to detain him; but he persisted in his resolution, and went away. Although she hummed a tune, and tried to look indifferent, Angélique could not conceal her vexation; and on hearing some remark made by one of the washerwomen, she left the shop in a pet, and walked out into the court. It was at this moment that Louis, who had seen nothing of all this by-play, reached the most pathetic part of his imaginary epistle, and eloquently reminded Angélique of their former attachment, once more begging to know how he had erred. 'Nay,' here interrupted the scrivener, who had been anxiously watching his opportunity for the last two or three seconds, 'you can best tell her all this yourself.' And before Louis could make any reply, he had partly opened his door, and calling on Angélique, who was just then passing before it, made her enter. It was not until she was in, and the door had been securely closed upon her by the considerate M. Gant, that the young girl became aware of Louis's presence. On seeing her lover, she started back and grew pale; but soon rallying, and casting a wrathful glance on the scrivener, she addressed Louis in an offended tone.

'Pray, sir, what is it so very particular you have to say to me here?'

'I assure you, mademoiselle,' stammered forth Louis, 'I only came for a letter which Monsieur Gant——' He looked for the letter on the desk, but there was none.

'Yes,' observed the scrivener in a tone of studied irony, 'I was waiting till you should have done. As mademoiselle is now here, you can tell her all you have to say. I have no doubt,' he superciliously added, 'it will spare me the trouble of writing down a good deal of nonsense;' and with a look of thorough contempt for all love-letters and love affairs, he took down Cornelius Nepos, and became to all appearance deeply absorbed by its contents.

There was a long and awkward silence: Louis at length began speaking in an embarrassed tone; his words were incoherent and low; but warming with his subject, he gradually grew so eloquent and pathetic, that M. Gant thought it was not in the heart of mortal maiden to resist him. Angélique, however, not only appeared to hear Louis without emotion, but when he had concluded, inquired, with freezing politeness, what else he had to say?

'Nothing,' faintly answered Louis. Angélique turned towards the door: the scrivener saw it was time for him to interfere.

'Children, children!' he reproachfully exclaimed; 'what is all this about? Who has come between your hearts and the love of so many years?' Angélique hung down her head, but remained silent.

'Nay,' observed Louis, now fairly exasperated, 'let her alone, Monsieur Gant, since she will not be softened.'

'And pray, sir,' cried Angélique angrily, 'who asks you to think of me at all?' Thus the scrivener's kind effort to effect a reconciliation between the lovers was on the point of embittering the quarrel; but by dint of coaxing, intreaties, and soothing words, he at last induced them to give him a patient hearing. This discourse, though somewhat long, was not very varied: he only spoke of their childhood and youth so happily spent in the court, of the pleasant evenings by the fountain, when Angélique sang, and Louis listened; yet he touched so many tender chords, and managed the matter so skillfully, that ere long Angélique drew forth a little white pocket handkerchief, which she applied to her eyes, whilst Louis turned his head away, and pretended to look into the court. M. Gant immediately followed up his advantage, and in less than five minutes had effected an entire reconciliation between the two lovers, who, to say the truth, were not sorry for it.

'And now,' said he, 'that it is all over, you must tell me what you quarrelled about.' This was, however, seemingly no easy matter to determine. Louis looked at Angélique, and Angélique at Louis; both were evidently in doubt on the subject. But M. Gant was a shrewd cross-questioner, and he soon elicited from Louis that he had long been secretly jealous of the young tailor, and that one evening when Angélique had provoked him by some unusual attention bestowed on his rival, he had spitefully declared a new purchase of hers odiously vulgar; an expression which, being uttered in the presence of several persons, the tailor included, had so mortally offended Angélique, that she had instantly resolved to discard him for ever.

'And this,' observed M. Gant in a tone of great contempt, after hearing them out—'this was the cause of your quarrel?' Though somewhat abashed, they confessed it was. But the scrivener was not satisfied; he had his own ideas on the subject; and indeed it soon came out that the applewoman was at the bottom of it all. With her usual malice she had first diverted the young tailor's attention from Marianne to Angélique; then by dark hints excited poor Louis's jealousy; and at last persuaded Angélique that no woman of spirit ought to forgive the affront she had endured. In short, she had, like all mischievous persons, been so very industrious in her evil task, that M. Gant no longer wondered at the trouble the quarrel of the two lovers had given him.

After some further conversation, Louis and Angélique rose to depart, not, however, without hearing M. Gant, who addressed them in a little set speech, rather formal and pedantic, but nevertheless kind and sensible,

showing them that the real cause of their quarrel had been the want of mutual trust and confidence. 'And now, children,' said he, as he concluded, 'take an old man's advice—quarrel no more, and be ever more ready to believe good of one another than evil.'

Promising to follow this advice, and once more warmly thanking him for his kindness, the lovers now left the scrivener to his own reflections. Scarcely were they gone, when M. Gant, who felt in a very undignified hurry to impart the news to Sergeant Huron, locked up his box before the usual time, and hastened to the abode of his trusty friend, who, listening to his prolix narrative with profound gravity, declared it was an admirable bit of campaigning, and that the scrivener had displayed the tactics of a general.

Although she was not at her stall when Louis and Angélique had their interview in the scrivener's abode, the applemoan had somehow or other obtained a knowledge of the fact. The next day she saw, as usual, M. Gant enter his box in the morning, but with the addition of a large parcel, which he carried under his arm; and a strange rumbling noise, as though M. Gant felt restless, and was walking to and fro in his mansion, followed his entrance; it, however, gradually subsided; and before long, he issued forth completely transformed, clad in a suit of rusty black, with a new hat and a white cravat. The applemoan's heart failed her: she had forebodings of a defeat. After carefully locking his door, M. Gant walked at a stately pace towards the washerwoman's shop. Whether by chance, or because she was aware of his visit, Angélique was out of the way. The scrivener gravely asked for her mother, and found the good lady up to her eyes in soap-water. She looked upon him with some surprise, opened her eyes when he spoke of a private interview, inwardly wondered if he wanted to give her his custom, and wiping her hands and arms in a very wet apron, led the way into the small back parlour. Here M. Gant gravely expounded to her the nature of his errand, relating all concerning the attachment of Louis and Angélique, and, in the name of his young friend, asking for her sanction to their attachment. The washerwoman heard him, and was astonished. What could make Angélique wish to marry? She had always thought that if a woman washed, and ironed, and worked hard, she had little time to think of marriage: so she had found since her husband's death. Nevertheless, she was not unreasonable, and declared that as Louis was a very honest, industrious young man, she should raise no objection to the match, if her daughter was bent upon it.

On the same evening the whole matter was settled. In the presence of her mother, of Louis's parents, whom the young man had consulted long ago, and of M. Gant, Angélique was *accordée*, or granted to Louis, who presented her with a gold ring and a handsome pair of earrings. The marriage was fixed to take place at the end of a month. The young couple were to reside in the court; and, to her mother's satisfaction, it was agreed that Angélique should continue to work with her.

The applemoan was now fairly vanquished. Truth and M. Gant had triumphed: Louis and Angélique were reconciled: and even the young tailor proved penitent, and humbled himself to Marianne, who graciously received him once more into her favour. The scrivener's spiteful little enemy could bear this no longer; her heart was stung every day by some fresh insult; she declared that the court was in a league against her; and in order to be revenged on them all at once, she went off one morning with her stall and her apples, and doubtless settled in some very remote quarter, for she has never since been heard of. Some old cronies of hers, with whom she constantly quarrelled while in the court, soon missed her very much, for she was the great news-monger of the place; and they threw out dark hints against the scrivener, even averring that he had caused her to be spirited away.

M. Gant, who knew nothing of these vague rumours, bore his triumph with great moderation. Indeed, with his usual simplicity, he rather missed the applemoan, and certainly thought more of the happiness enjoyed by Louis and Angélique than of her defeat. When the wedding took place, he was the spirit of the whole party: he acted as Louis's witness at the civil contract, gave the bride away in the church, settled every doubtful point of etiquette, and with Sergeant Huron, who had been invited out of compliment to him, sang such witty songs after dinner, that everybody was charmed. The scrivener himself was astonished, and somewhat ashamed; he was even heard by his old friend wondering what had induced a philosopher like him to meddle in a silly love affair; but, to say the truth, he was quite delighted.

The married life of Louis and Angélique proved more happy than their courtship. They treasured up the words of their old friend, and acted towards each other with confidence and truth. M. Gant, whose infirmities increase with age, has been induced, not to abandon his box—nothing earthly could make him do that—but to take his meals with them, in return for which he most zealously teaches their children how to read and write, so that they will most probably be able in time to indite their own love-letters. Sergeant Huron is still alive, but, as the scrivener observes in a melancholy tone, growing rather weak-minded—a remark which the worthy sergeant sometimes applies in turn to his old friend. The cobbler has retired from business; the shed has been demolished, and a shop, occupied by Louis's brother, erected where it once stood. Marianne is married to the young tailor. The washerwoman is as industrious as ever. We forgot mentioning that, as an instance of the diminished faculties of his friend, Sergeant Huron has informed Angélique that M. Gant is convinced the applemoan will soon make her re-appearance in the court. This he believes on philosophical grounds, averring that he has been too long happy and undisturbed. Of course Sergeant Huron is above this learned nonsense; but he has also informed Angélique, from whom he can conceal nothing, that, after all, he should not wonder if it were to turn out true; for since his friend mentioned the subject, he has three times beheld in a dream the applemoan seated at her stall. But as six months have already passed away since then, it is somewhat doubtful if she will ever make her appearance.

THE SILVER-MINERS OF PERU.

The number of Indian lives sacrificed in the mines of Peru, during the last three centuries, is estimated by some writers at nine millions! At the close of the second century of slavery, an attempt was made by the natives to shake off the brutal yoke of the Spaniards; and in 1780 an Inca was actually elected, in whose person, it was fondly hoped, those glories of the old emperors were to revive which had been quenched in blood by Pizarro. The attempt was unfortunate, and the patriot king and his family were executed with circumstances of terrific barbarity. Another effort cost a hundred thousand lives, including the slaughter of the whole inhabitants of a town—twenty-two thousand men, women, and children—by the insurgents. Then came the rising of the Creoles themselves (the descendants of Europeans), and the war of independence; in which the Indians took, generally, the popular side, although, when an opportunity occurred, they massacred indiscriminately all white men—vowing not to leave a white dog or a white fowl alive, and in their fantastic hatred, even scraping the whitewash from their walls! The war of independence overthrew the Spanish dominion, and established a republic; but although the Indians still remained the Pariahs of the country where they were once masters, their condition and prospects were, and are, greatly changed by the results of the contest. They learned the art of war, and the use of gunpowder and its manufacture; and every man who

was armed by the belligerents, preserves his musket, and keeps it religiously in some secret recess, biding his time. The Creoles have not been taught wisdom by the fate of the Spaniards. The republicans are as tyrannical as the monarchists; and the day will assuredly come when the trampled Indians will writhe up in their frantic despair, and deluge the country with blood anew.

In that day their chances of success will be considerable. With arms, military habits, and, strange as it may seem, *treasure*, their still overwhelming numbers will tell upon their tyrants; and it would be hazardous to say that Peru will not, at some early period, be once more, for however short a period, under the government of the Incas. Under such circumstances, the character of the people presents a subject of the deepest interest; and our readers will perhaps thank us for directing them to the best recent authority, the travels of Dr Tschudi in Peru.* Three hundred years of oppression, we are informed by this author, have impressed their melancholy stamp upon the feelings and manners of the people. They are unsocial, gloomy, and meditative; they are fond of dark colours in their dress; and though indifferent to most other things, the wild sad wail of the reed-clarinets draws tears from their eyes. They drink great quantities of intoxicating liquors, and chew habitually a substance called *chicha*—answering in some respects to tobacco, and in others to opium; but notwithstanding, they live to a great age. Instances are not rare of their attaining to one hundred and twenty or one hundred and thirty years, and our author himself knew an Indian who had at that time attained the goodly age of one hundred and forty-two. This patriarch had regaled himself on *chicha* for ninety years, without ever tasting a drop of water, and from his boyhood had masticated coca at least three times a-day. It is likewise remarkable that these aged persons have always fine black hair, which with the Indians never turns white, and very seldom even gray. They likewise retain their teeth to the last. The silver mines are worked, and must always be so, by Indians. The following is Dr Tschudi's account of the labourers:—

'The working-class of miners is composed of Indians, who throng to Cerro de Pasco from all the provinces, far and near, especially when *boyas* are expected. At times, when the mines are not very productive, the number of Indian labourers amounts to between three and four thousand; but when there is a great supply of metal, the ordinary number of mine-workers is more than tripled. The Indians labour with a degree of patient industry, which it would be vain to expect from European workmen similarly circumstanced. This observation applies to the *hapires* in particular. Content with wretched food, and still more wretched lodging, the *hapiro* goes through his hard day's work, partaking of no refreshment but coca, and at the end of the week (deduction being made for the food, &c. obtained on credit from the *minero*), he possibly finds himself in possession of only a single dollar.' This, or whatever sum he possesses, he usually spends on intoxicating liquors on Sundays and other holidays, on which occasions he is rude and quarrelsome, and commits fearful acts of mischief—intellectual darkness here, as among the railway excavators of England, producing excesses which are a scandal to the general community.

'When an unusually abundant produce of the mines throws extra payment into the hands of the mine labourers, they squander their money with the most absurd extravagance, and are excellent customers to the European dealers in dress and other articles of luxury. Prompted by a ludicrous spirit of imitation, the Indian, in his fits of drunkenness, will purchase costly things which he can have no possible use for, and

which he becomes weary of after an hour's possession. I once saw an Indian purchase a cloak of fine cloth, for which he paid ninety-two dollars. He then repaired to a neighbouring tavern, where he drank till he became intoxicated, and then, staggering into the street, he fell down, and rolled in the kennel. On rising, and discovering that his cloak was besmeared with mud, he threw it off, and left it in the street, for any one who might choose to pick it up. Such acts of reckless prodigality are of daily occurrence. A watchmaker in Cerro de Pasco informed me that one day an Indian came to his shop to purchase a gold watch. He showed him one, observing that the price was twelve gold ounces (two hundred and four dollars), and that it would probably be too dear for him. The Cholo paid the money, and took the watch; then, after having examined it for a few minutes, he dashed it on the ground, observing that the thing was of no use to him. When the Indian miner possesses money, he never thinks of laying by a part of it, as neither he nor any of his family feel the least ambition to improve their miserable way of life. With them, drinking is the highest of all gratifications, and in the enjoyment of the present moment they lose sight of all considerations for the future. Even those Cholos who come from distant parts of the country to share in the rich harvest of the mines of Cerro de Pasco, return to their homes as poor as when they left them, and with manners and morals vastly deteriorated.'

The employers of the labourers, whether Europeans or Creoles, it would appear, are neither more amiable nor more rational. They are called *mineros*. 'The majority of the *mineros* are descendants of the old Spanish families, who, at an early period, became possessors of the mines, whence they derived enormous wealth, which most of them dissipated in prodigal extravagance. At the present time, only a very few of the *mineros* are rich enough to defray, from their own resources, the vast expense attending the operations of mining. They consequently raise the required money by loans from the capitalists of Lima, who require interest of 100 or 120 per cent., and, moreover, insist on having bars of silver at a price below standard value. To these hard conditions, together with the custom that has been forced upon the miners of paying their labourers in metal, at times when it is very abundant, may be traced the cause of the miserable system of mine-working practised in Cerro de Pasco. To liquidate his burdensome debts, the *minero* makes his labourers dig as much ore as possible from the mine, without any precautions being taken to guard against accidents. The money-lenders, on the other hand, have no other security for the recovery of their repayment than the promise of the *minero*; and a failure of the usual produce of a mine exposes them to the risk of losing the money they have advanced.

'Under these circumstances, it can scarcely be expected that the character and habits of the *minero* should qualify him to take a high rank in the social scale. His insatiable thirst for wealth continually prompts him to embark in new enterprises, whereby he frequently loses in one what he gains in another. After a mine has been worked without gain for a series of years, an unexpected *boya* probably occurs, and an immense quantity of silver may be extracted. But a *minero* retiring on the proceeds of a *boya* is an event of rare occurrence. A vain hope of increasing fortune prompts him to risk the certain for the uncertain; and the result frequently is, that the once prosperous *minero* has nothing to bequeath to his children but a mine heavily burdened with debt. The persevering ardour of persons engaged in mining is truly remarkable. Unchecked by disappointment, they pursue the career in which they have embarked. Even when ruin appears inevitable, the love of money subdues the warnings of reason, and hope conjures up, from year to year, visionary pictures of riches yet to come.

'Joined to this infatuated pursuit of the career once entered on, an inordinate passion for cards and dice

* Travels in Peru during the Years 1836—1842. By Dr J. J. Von Tschudi. Translated from the German by Thomasina Ross. London: Bogue. 1847.

contributes to ruin many of the mineros of Cerro de Pasco. In few other places are such vast sums staked at the gaming-table, for the superabundance of silver feeds that national vice of the Spaniards and their descendants. From the earliest hours of morning, cards and dice are in requisition. The mine-owner leaves his silver stores, and the shopkeeper forsakes his counter, to pass a few hours every day at the gaming-table; and card-playing is the only amusement in the best houses of the town. The mayordomos, after being engaged in the mines throughout the whole day, assemble with their comrades in the evening round the gaming-table, from which they often do not rise until six in the morning, when the bell summons them to resume their subterraneous occupation. They not unfrequently gamble away their share of a boya before any indication of one is discernible in the mine.

The enormous prizes, however, which individuals sometimes stumble on in this great lottery, serve as a temptation which can hardly be resisted. For instance, 'the owner of the mines of San Jose requested the viceroy Castro, whose friend he was, to become godfather to his first child. The viceroy consented, but at the time fixed for the christening, some important affair of state prevented him from quitting the capital, and he sent the vice-queen to officiate as his proxy. To render honour to his illustrious guest, the owner of the San Jose mines laid down a triple row of silver bars along the whole way (and it was no very short distance) from his house to the church. Over this silver pavement the vice-queen accompanied the infant to the church, where it was baptised. On her return, her munificent host presented to her the whole of the silver road, in token of his gratitude for the honour she had conferred on him.' But the mineros were not always allowed to enjoy their wealth. 'Don Jose Salcedo, a poor Spaniard, who dwelt in Puno, was in love with a young Indian girl, whose mother promised, on condition of his marrying her daughter, that she would show him a rich silver mine. Salcedo fulfilled the condition, obtained possession of the mine, and worked it with the greatest success. The report of his wealth soon roused the envy of the Count de Lemos, then viceroy of Peru, who sought to possess himself of the mine. By his generosity and benevolence, Salcedo had become a great favourite with the Indian population, and the viceroy took advantage of this circumstance to accuse him of high treason, on the ground that he was exciting the Indians against the Spanish government. Salcedo was arrested, tried, and condemned to death. Whilst he was in prison, he begged to be permitted to send to Madrid the documents relating to his trial, and to appeal to the mercy of the king. He proposed, if the viceroy would grant his request, that he would pay him the daily tribute of a bar of silver, from the time when the ship left the port of Callao with the documents, until the day of her return. When it is recollected that at that period the voyage from Callao to Spain occupied from twelve to sixteen months, some idea may be formed of the enormous wealth of Salcedo and his mine. The viceroy rejected this proposition, ordered Salcedo to be hanged, and set out for Puno to take possession of the mine.'

'But this cruel and unjust proceeding failed in the attainment of its object. As soon as Salcedo's death-doom was pronounced, his mother-in-law, accompanied by a number of relations and friends, repaired to the mine, flooded it with water, destroyed the works, and closed up the entrance so effectually, that it was impossible to trace it out. They then dispersed; but some of them, who were afterwards captured, could not be induced, either by promises or tortures, to reveal the position of the mouth of the mine, which to this day remains undiscovered. All that is known about it is, that it was situated in the neighbourhood of Cerro de Laycacota and Cananchari.'

It may appear strange that a poor Indian girl, the

daughter, perhaps, of a mine-labourer, could bring such a dowry to her husband; but the following revelation will account for the circumstance, and if viewed with reference to the probable destinies of the natives which we have hinted at, will be considered of importance. 'Notwithstanding the enormous amount of wealth which the mines of Peru have already yielded, and still continue to yield, only a very small portion of the silver veins have been worked. It is a well-known fact, that the Indians are aware of the existence of many rich mines, the situation of which they will never disclose to the whites, nor to the detested mestizos. Heretofore, mining has been to them all toil and little profit, and it has bound them in chains from which they will not easily emancipate themselves. For centuries past the knowledge of some of the richest silver mines has been, with inviolable secrecy, transmitted from father to son. All endeavours to prevail on them to divulge these secrets have hitherto been fruitless. In the village of Huancayo, there lived, a few years ago, two brothers, Don Jose and Don Pedro Yriarte, two of the most eminent mineros of Peru. Having obtained certain intelligence that in the neighbouring mountains there existed some veins of pure silver, they sent a young man, their agent, to endeavour to gain further information on the subject. The agent took up his abode in the cottage of a shepherd, to whom, however, he gave not the slightest intimation of the object of his mission. After a little time, an attachment arose between the young man and the shepherd's daughter, and the girl promised to disclose to her lover the position of a very rich mine. On a certain day, when she was going out to tend her sheep, she told him to follow her at a distance, and to notice the spot where she would let fall her *maata*; by turning up the earth on that spot, she assured him he would find the mouth of a mine. The young man did as he was directed, and after digging for a little time, he discovered a mine of considerable depth, containing rich ore. Whilst busily engaged in breaking out the metal, he was joined by the girl's father, who expressed himself delighted at the discovery, and offered to assist him. After they had been at work for some hours, the old Indian handed to his companion a cup of chicha, which the young man thankfully accepted. But he had no sooner tasted the liquor than he felt ill, and he soon became convinced that poison had been mixed with the beverage. He snatched up the bag containing the metal he had collected, mounted his horse, and with the utmost speed galloped off to Huancayo. There he related to Yriarte all that had occurred, described as accurately as he could the situation of the mine, and died on the following night. Active measures were immediately set on foot to trace out the mine, but without effect. The Indian and all his family had disappeared, and the mine was never discovered.'

Before closing this interesting book, we must present a view of the great mining city referred to in the above extracts. 'Having traversed the long and difficult route from the capital of Peru, by way of the wild Cordillera to the level heights of Bombon, and from thence having ascended the steep, winding acclivities of the mountain chain of Olachin, the traveller suddenly beholds in the distance a large and populous city. This is the celebrated Cerro de Pasco, famed throughout the world for its rich silver mines. It is situated in 10 degrees 48 minutes south latitude, and 76 degrees 23 minutes west longitude, and at the height of 13,673 feet above the sea level. It is built in a basin-shaped hollow, encircled by barren and precipitous rocks. Between these rocks, difficult winding roads or paths lead down to the city, which spreads out in irregular divisions, surrounded on all sides by little lagoons, or swamps. The pleasing impression created by the first view of Cerro de Pasco from the heights is very greatly modified on entering the town. Crooked, narrow, and dirty streets are bordered by rows of irregularly-built houses; and miserable Indian huts abut close against well-built dwellings, whose size and structure give a certain European cha-

* The date of Salcedo's death was May 1699.

racter to the city when viewed from a distance. Without bestowing a glance on the busy throng which circulates through the streets and squares, the varied styles of the buildings sufficiently indicate to the observer how many different classes of people have united together to found, in the tropics, and on the very confines of the perpetual snow, a city of such magnitude, and of so motley an aspect. The wild barrenness of the surrounding scenery, and the extreme cold of the rigorous climate, the remote and solitary position of the city, all denote that one common bond of union must have drawn together the diversified elements which compose the population of Cerro de Pasco. And so it really is. In this inhospitable region, where the surface of the soil produces nothing, nature has buried boundless stores of wealth in the bowels of the earth, and the silver mines of Cerro de Pasco have drawn people from all parts of the world to one point, and for one object.'

SARAH MARTIN.

In the last number of the 'Edinburgh Review'—one of the best which has appeared for some time—an article occurs on the subject of 'Prison Visiting,' interesting from the reference it makes to a case of singular and unostentatious benevolence. The history of this case, which is quite refreshing, from the quantity of good done in comparison with the little said of it by the principal party concerned, may be given as follows.

About thirty years ago, the prison of Yarmouth in Norfolk was in the most wretched condition. The prisoners spent their time in gaming, swearing, fighting, and everything else that was abominable. There was no work, no schoolmaster, no clergyman. No divine service was performed on Sunday, nor was any peculiar attention paid to that day. The whole place was filthy, confined, and unhealthy, and the inmates were infested with vermin and skin diseases. All this, it would appear, was disregarded by the town authorities, and things continued to be as bad as possible till 1819. In that year a woman was confined in the prison for having cruelly maltreated her child; and with the view of exercising a beneficial influence over the culprit, a pious female in the neighbourhood bethought herself of visiting her. The name of this excellent though obscure female was Sarah Martin. She was an orphan, resided with her widowed grandmother at Caister, and now, at twenty-eight years of age, gained a livelihood by sewing. She had received only a plain education, and was no further prepared for undertaking the office of instructor than by the experience she had acquired from teaching a class in a Sunday school.

It will seem very strange that a female with so little social influence, and entirely from the promptings of her own heart, should have thought of reforming the jail of Yarmouth; yet such was the fact. Having frequent occasion to pass the prison, she was shocked with what she heard of its condition; and animated with the hope of reclaiming the unfortunate woman above alluded to, she ventured, with the approval of her grandmother, on making her first visit. Considering the character of the place, and of the individuals confined in it, the enterprise was daring; but our heroine—and was she not a true heroine?—entertained no fears for her personal safety.

Sarah accordingly visited the cell of the unnatural mother, and spoke to her in the language of pious admonition and hope. The woman thanked her, and burst into tears; and the messenger of mercy felt confirmed in her resolutions. With this good beginning, she visited the jail at such intervals of leisure as she could spare from her daily occupations. From addressing the first object of her solicitude, she proceeded to speak and read to the other prisoners. Her language

was that of gentle persuasion; her manual, the New Testament. Virtue is ever respected by the most dissolute; and Sarah had the satisfaction of seeing that she was not only listened to, but obeyed. With no other power than kindness, she ruled the wild democracy with greater effect than if armed with all the terrors of the law.

Warming as she went on in her self-imposed duties, she gave up one entire working-day in the week, besides Sunday, to the prison, thus devotedly sacrificing no inconsiderable portion of her means. Having brought the prisoners into a kind of subjection, she divided them into classes, and taught them reading and writing; and afterwards, in order to keep them in useful employment, introduced work of different kinds. The capital with which she commenced these handicraft labours was no more than thirty shillings, which she had received in charitable subscriptions; but with this she procured some useful materials, such as straw for hats, and cloth for caps, and the sale of the manufactured articles kept up the stock. Through these means many female prisoners were taught to sew in the prison, and general industrious habits were created among all.

But Sarah's labours did not end here. She caused the adoption of Sunday services in the prison, and she had now the inestimable privilege, as she considered it, of being allowed to minister to the spiritual wants of the inmates on a comprehensive scale. For some time she read printed sermons, but afterwards delivered discourses of her own composition, as more directly applicable to her purpose. We are not told to what sect Sarah belonged, and are therefore unable to gratify curiosity on that important particular. As far as we have the means of judging, she was a Christian after the manner of the evangelists; nor does she appear to have harassed either herself or her hearers with doctrinal difficulties or ecclesiastical disputes. She spoke expressly to the understanding and feelings; and, like the good vicar of Wakefield in similar circumstances, described, in simple and affecting language, the superior advantages of virtue over vice, of good over bad conduct, along with the hopes of a blessed immortality enjoyed by those who follow the injunctions of the gospel. Speaking of the efficacy of these prelections, the reviewer observes:—'The cold, laboured eloquence which boy-bachelors are authorised by custom and constituted authority to inflict upon us—the dry husks and chips of divinity which they bring forth from the dark recesses of theology (as it is called) of the Fathers, or of the middle ages—sink into utter worthlessness by the side of the jail addresses of this poor uneducated seamstress.' Of whom was her congregation usually composed? 'Pert London pickpockets, whom a cheap steamboat brought to reap a harvest at some country festival; bores, whom ignorance and distress led into thefts; depraved boys, who picked up a precarious livelihood amongst the chances of a seaport town; sailors, who had committed assaults in the boisterous hilarity consequent upon a discharge with a paid-up arrear of wages; servants, of both sexes, seduced by bad company into the commission of crimes against their masters; profligate women, who had added assault or theft to the ordinary vices of a licentious life; smugglers; a few game-law criminals; and paupers, transferred from a workhouse, where they had been initiated into crime, to a jail, where their knowledge was perfected. Such were some of the usual classes who assembled around this singular teacher of righteousness.'

Thus did the self-devoted Sarah go on from year to year, heedless of worldly fame or worldly reward. In 1826 she came into the possession of a small annuity of ten or twelve pounds, by the death of her grandmother; but this did not substantially improve her circumstances, for about the same period her employment as a dressmaker declined, in consequence of her mind being so much absorbed in her prison labours. It might with some have now been a question whether to relinquish the prison teachings, or to go on with them in the

midst of poverty. Sarah never hesitated. In the notes she wrote respecting her labours, the noble passage occurs—'My mind, in the contemplation of such trials, seemed exalted by more than human energy; for I had counted the cost, and my mind was made up. If, whilst imparting truth to others, I became exposed to temporal want, the privation so momentary to an individual would not admit of comparison with following the Lord in thus administering to others.'

It was impossible that such genuine philanthropy should escape attention; many individuals felt interested in Sarah's struggles, and wished to relieve her poverty. She accordingly received occasional presents of clothes, and other articles likely to render her life more comfortable; but 'whatever was sent to her, was given away to persons more destitute than herself.' Some members of the corporation now proposed to make some provision for her from the borough funds; but the design was laid aside. A similar proposal was renewed in 1841. Sarah, however, entertained serious scruples about receiving what appeared to be a money compensation for her services. 'Such scruples,' observes the reviewer, 'should have been held sacred. Corporation gratitude should have been exhibited in some way which would not have excited a feeling of self-degradation; but alas! a jail committee does not enter into questions of feeling. It was coarsely intimated to this high-souled woman, "If we permit you to visit the prison, you must submit to our terms;" and these worshipful gentlemen, who were then making use of Sarah Martin as a substitute for the schoolmaster and the chaplain, whom it was by law their bounden duty to have appointed, converted her into their salaried servant by the munificent grant of £12 per annum!'

This remarkable woman did not long survive to enjoy corporation patronage or bounty. Her health began to fail in the winter of 1842; and, after enduring the agonies of a protracted disease, she joyfully sunk to her rest on the 15th of October 1843. 'She was buried at Caister, by the side of her grandmother; and a tombstone in the churchyard bears a simple inscription, written by herself, which commemorates her death and age, but says not a word of her many virtues!'

The notice of Sarah Martin's life has been drawn up by the reviewer from a work purporting to be memoirs written by herself; also a volume of poems, of which she was the authoress; and the Report of Inspector of Prisons for the northern district: it may therefore be presumed to be a faithful, though brief record of her meritorious works of mercy. In bringing prominently into view a biography of such practical value, the writer of the article in question has done good service to the cause of human amelioration; and we can sympathise with him when he remarks, that 'it is the business of literature to make such a life stand out from the masses of ordinary existences, with something of the distinctness with which a lofty building appears itself in the confusion of a distant view. It should be made to attract all eyes, to excite the hearts of all persons who think the welfare of their fellow-mortals an object of interest or duty; it should be included in collections of biography, and chronicled in the high places of history; men should be taught to estimate it as that of one whose philanthropy has entitled her to renown, and children to associate the name of Sarah Martin with those of Howard, Buxton, Fry—the most benevolent of mankind!'

If Sarah Martin, however, is to be judged by the means at her disposal, and by the unostentatious manner in which her services were performed, we should pronounce her to be deserving of a higher meed of applause than Howard, Fry, Buxton, or any other modern philanthropist. It must not be forgotten that she was never anything else than a poor needlewoman, struggling to earn her bread; and that, finally, she sacrificed even this means of subsistence to carry out her considerate schemes of charity. It is of not less importance to remember that she went to work with-

out any preliminary parade, and continued her labours without the slightest desire for their public recognition. In this latter circumstance is disclosed the truly magnanimous mind of the heroine—there is revealed the true soul of the Christian. While the great ones of the earth were dreaming or squabbling over their respective pet doctrines, and hesitating as to the exact methods by which a crew of desperadoes were to be humanised and reclaimed, up rises an obscure and friendless female, who, without parade, or talk, or any other species of trumpeting, performs all that everybody could desire. It is, therefore, not alone as a poor woman, but as a being who worked, and set about her work at once, that she must be accorded the highest meed of posthumous fame. And how immeasurably great are her deserts compared with those of the many recipients of heaven's richest bounties, who consume life in mere speculative cravings, and who, while practising Christianity, as they imagine, are doing little more than shamming it!

FOLLIES OF THE WISE.

In poring over the works of the natural philosophers who flourished during the seventeenth, and part of the eighteenth century, it has afforded us considerable amusement to hunt up the follies and eccentricities with which these learned men alternately amused and astonished their friends and themselves. The seventeenth century was particularly prolific in such men, among whom Kircher, Scholtus, and Porta were pre-eminent. They esteemed it perfectly congruous to unite mathematics with magic; natural philosophy with feats of juggling and trickings of the senses; and it may be doubted whether, in several instances, science was not pursued more for its marvels, than for the substantial benefits it was calculated to confer. The substance was prized only for its shadow! The learned of that day thus became the wonder-working magicians, who, with an enthusiasm worthy of a nobler end, delighted a select circle of friends and fellow-philosophers with the illusions which the present age happily consigns to the itinerant conjuror, for the delectation of juvenile parties. The truth is, philosophy was in its childhood: it had not yet learned to put away childish things. Few subjects present us with a more striking illustration of the immaturity of science, than the manifest tendency to the marvellous which formed the distinguishing feature of the philosophic character of that epoch. The curious bits of clock-work, the phantasmagoric apparatus, the ceaseless attempts at 'perpetual motion,' and the sundry other contrivances, the history of which has come down to us, are melancholy trophies of its misdirected energies. They were toys which advancing years were to cast aside; and the sketches about to be given, are offered simply to remind us of what were the immediate precedents of the brighter light we are now privileged to enjoy.

The learned Jesuit Kircher has been mentioned as among the most eminent of these philosophers. From his voluminous writings, and from a huge folio volume descriptive of his museum, may be collected some of the devices with which he succeeded in surprising and terrifying his acquaintance. His museum was, in fact, a kind of polytechnic in miniature, only it contained things and mechanisms of which our polytechnist is entirely ignorant. Among his automatic instruments was one which he appears to have greatly delighted in: it was a kind of turreted castle. Down the towers a couple of brass balls were wont to be rolled, and, surprising to say, in some mysterious manner they reappeared at the summit again. The same apparatus then exhibited a scene representing a large number of female heads in succession, each displaying a different mode of coiffure. While the spectators were wondering when this marvellous development of female ingenuity would have an end, suddenly a gate would burst open, and reveal a dismal cave, in which a horrid monster,

bound with a massive chain, lay bellowing, and vainly endeavouring to tear from his throat the glittering serpent which had coiled itself around him. A hissing dragon and savage-looking witch made tremendous grimaces at one another from out of little windows in the opposite sides of the cave; after which fearful performances, the chest closed itself up. The philosopher would then further amuse his visitors by a representation of Jonah swallowed up by the whale: this, we are informed, he succeeded in effecting by constructing a small figure of the prophet, having a magnet concealed in one leg, and putting a more powerful one in the interior of the figure of the great fish. Things were all ready for the swallowing up of the prophet, and he and the fish were sent to swim in a basin of water, and presently, before the eyes of the wondering visitors, poor Jonah would disappear in a twinkling down the fish's throat!

Kircher appears also to have laboured hard to compass the realisation of the fable concerning the iron coffin of Mahomet; but in vain: he has, however, left as a receipt for making a bird which should be suspended in the air; but it is to be feared it is rather an exercise of his imagination than an actual possibility. He certainly invented those curious toys now sold by every philosophical instrument-maker, known as the 'bottle imps,' consisting of a long glass cylinder full of water, and having little figures of glass inside, which can be made to rise and fall by pressure upon the bladder which covers the vessel. Among the other remarkable of his museum were little ships which set out from port, performed a miniature voyage, tacked, and returned to harbour again; with divers other hydraulic toys, motions, and mechanisms, in which the child-philosopher took a profound delight. Kircher, however, demands an expression of gratitude from every one who in his boyhood has been intoxicated with the mysterious charms of the magic lantern. It was invented by him about the middle of the seventeenth century, and became a formidable addition to the supernatural capabilities of this already marvel-doing man. His optical illusions were really of a high order; and there may be reason to doubt whether some of them were not used for a less legitimate purpose than the playful amusement of his friends. He contrived an apparatus for the production of aerial figures; and on one occasion he represented the ascension of our Saviour, in a manner so life-like, as to strike all who beheld it with awe; and they could not be dissuaded from the belief that it was real, until they attempted to grasp the figure. Another of his marvels was to put his friends into a darkened room, and suddenly to cast a blaze of light upon the wall, in the midst of which would be seen the mysterious word, 'Beware!'

Italy, the nurse of the fine arts, at that period teemed with similar collections of curiosities. The palaces of her nobility were incomplete without them. The villa of the Cardinal Aldobrandini was a second fairyland, possessing beauties natural, artistic, and magical, in no common degree. In a grotto in the garden the cardinal had constructed all manner of curious rocks, hydraulic organs, and automatic birds: the birds sang and chirped, the organs discoursed most eloquent music, and the rocks moved, and melted into fountains of water. To these were added several other pageants and scenes, in which thunder and lightning, and wind and rain, were miraculously represented. In a word, one who visited it with intense delight says, 'You could scarcely stir a step without being wetted through;' which was a very favourite practical joke of the seventeenth century. In one of the rooms of this villa was a copper ball, which was for ever suspended in the air; about a yard from the ground, to the great wonderment of the spectator. Beneath it was a hole, through which rushed a strong blast of air, which buoyed up the copper ball upon its beam. At the Borghese palace the visitor was shown a chair, in which he was politely requested to seat himself; and instantly upon doing so, he found himself

tightly embraced by the springing up of the arms, other pieces starting forwards and pinioning his legs, so that he could not release himself until some one came to his assistance. Winstanley, in our own country, had invented a precisely similar captivator. In the same palace was a statue of a satyr, which mimicked the human voice, and rolled its eyes and head 'in a manner very terrible to behold.' The museum of Settala at Milan was widely celebrated during the same epoch for divers kinds of marvel-exciting things, in which objects of natural history took an inferior rank to some of the ridiculous automatic ingenuities of the day.

Before returning to our own country, let us spend a few moments with J. Baptist Porta, the follies of whom it were unjust to omit from a place in our catalogue. If ever man deserved the name of wizard, that man was Porta. His work on natural magic, well-known to most persons, is an extraordinary instance of the prostitution of an acute and penetrating genius to the mere purpose of exciting popular wonder. He appears to have been the inventor of the camera-obscura; at any rate he made use of a device in which its principle was involved: he thus, by constructing figures of wood, &c. and placing them in a chamber strongly illuminated, filled the side of the apartment in which his friends were with spectres, battle-scenes, and hunting representations; and he accompanied them, by collusive agency, with all the life of a real scene: horns were heard, men and horses dashed across the field, the sun shone, the very clouds moved onwards, and the branches of the trees bent before the passing wind. Everything in Porta's house partook of a magical character. The drinking vessels were most mysterious: if a person ventured to raise one of these dreadful glasses to his lips, suddenly a shower of the liquid would burst upon his face, and drench his clothes. Another wonderful glass would yield its contents to the thirst of none but of him who knew the secret of its construction. 'When his friends drank wine out of the same cup which he used, they were mortified with wonder; for he drank wine, and they only water! Or when, on a summer's day, all complained of the sirocco, he would freeze his guests with cold air in the room, or on a sudden let off a flying dragon, to sail along with a cracker in its tail, and a cat tied on its back! so that it required strong nerves, in an age of apparitions and devils, to meet this great philosopher when in his best humour.' In another apartment, an air-drawn dagger would seem to strike at one's heart; or one's limbs would be seen to be distorted, swollen, or contracted, or multiplied. Moreover, Porta knew the secret of making a man believe himself to be a bird—none other than a goose!—and attempt to fly; or a fish, and attempt to swim; which was by dosing him with a certain medicine. He could also make a man drunk or sober at his pleasure. When these varied attainments are reflected on, it will not be surprising that his visitors were almost exclusively his philosophic contemporaries, whose moral courage was equal to the contemplation of his supernaturalities.

Winstanley, the unfortunate architect of the Eddystone lighthouse, was Porta's representative in England. In the admirable work of Smeaton upon that structure, some particulars are mentioned which refer to the strange taste of his predecessor in the work for nick-nackeries. Winstanley had a house at Littlebury in Essex, which in many respects resembled that of Porta in Italy. A slipper, lying carelessly on the floor, if kicked aside, would suddenly give birth to a ghastly phantom, which would start up to scare the intruder. His arm-chair was, if possible, even a more alarming piece of furniture. 'If you sat down,' writes Smeaton, 'in a certain arbour by the side of a canal, you were forthwith sent out afloat into the middle of the canal, from whence it was impossible to escape until the manager drew it back again.' It is stated that he subsequently formed a public exhibition at the west end of London of some curious water-works, mentioned in the

'Tatler' for September 1709, the admission to which was one shilling. The exhibition appears to have consisted of curious *jets d'eau* principally. Unhappily his talent for whimsicalities proved at length fatal to him, as there is no doubt that the fancifulness of the Eddystone lighthouse, built by him, was mainly conducive to its destruction.

The celebrated Sir Samuel Morland was another of the virtuosi of the same epoch. The Lord-Keeper Guilford once dined with this philosopher, and spent a pleasant day in the midst of all sorts of wonders. Sir Samuel was then resident at Vauxhall, and had been at a great expense in filling his house with ingenious contrivances. At the dinner in question, a large fountain was made to play in the room, and the drinking-glasses each stood under little streams of water. The windows, doors, hinges, and chimneys were all the contrivance of the philosopher, and were of course all of them out of the common way. His museum must have been worth looking at, for gossip Evelyn, who went to see everything, has a note, 'I went to see Sir Samuel Morland's inventions and machines, arithmetical wheels, quench-fires, and new harp.' A wonderful contrivance of his was his clock-work cooking apparatus, which, he says, with some dismay, cost him thirty pounds! It contained a fireplace and grate, and would broil a cutlet, or make a stew, or roast an egg to a nicety. He carried this surprising mechanism with him when he travelled; and at inns, we are informed, he was his own cook!

These examples may suffice for our purpose. Let it not be imagined that in the age in which these wonder-raising things and men flourished, the marvels were regarded, as now, as mere efforts of philosophy in her playful moods: far from it. There is abundant evidence to show that they occupied a far too high and important station in the minds of philosophers. When, therefore, the daybreak advanced, they fell to the subordinate position, and assumed the more trivial character which properly appertains to them. This is the line, then, which is to be drawn between the 'follies of the wise' of that day, and the amusements of the wise since that time. To both, however, we owe much instructive and delightful recreation, and, in several instances, the first idea of implements and apparatus which are now applied to purposes the most useful and important.

THE SLAVE SYSTEM OF ENGLAND.

ENGLAND has, professedly, no slaves; but, as we lately attempted to show,* she has a system of slavery nevertheless, in consequence of some peculiarities in her arrangements regarding pauperism. A member of the humbler classes no sooner begins to exist, than he becomes a subject of very grave consideration to his superiors—where and upon whom is he to be chargeable on the failure of employment? Chargeability is the English slave system. The poor man cannot go where he lists in search of employment—he may become chargeable. He cannot take a good place which may be offered to him, for he cannot get a residence, lest he become chargeable. Houses are pulled down over the ears of honest working-men, and decent poor people are driven from Dan to Beersheba, lest they should become chargeable. There is something infinitely distressing in the whole basis of this idea—that an English peasant must needs be regarded from his first breath, and all through life, as a possible pauper. But the positive hardships arising from the idea are what we have at present to deal with.

These are delineated in a happy collection of facts, lately brought forward by Mr Chadwick at a meeting of the Farmers' Club in London. It appears that the company assembled, who, from their circumstances, were all qualified to judge of the truth of the facts and the soundness of the conclusions, gave a general assent to what was said by the learned Poor-Law secretary.

Unfortunately, we can only give a few passages from this very remarkable speech.

Mr Chadwick first referred to the operation of the existing law upon *unsettled* labouring men. 'The lower districts of Reading were severely visited with fever during the last year, which called attention to the sanitary condition of the labouring population. I was requested to visit it. Whilst making inquiries upon the subject, I learned that some of the worst-conditioned places were occupied by agricultural labourers. Many of them, it appeared, walked four, six, seven, and even eight miles, in wet and snow, to and from their places of work, after twelve hours' work on the farm. Why, however, were agricultural labourers in these fever-nests of a town? I was informed, in answer, that they were driven in there by the pulling down of cottages, to avoid parochial settlements and contributions to their maintenance in the event of destitution. Amongst a group, taken as an example there, in a wretched place consisting of three rooms, ten feet long, lived Stephen Turner, a wife, and three children. He walked to and from his place of work about seven miles daily, expending two hours and a-half in walking before he got to his productive work on the farm. His wages are 10s. a-week, out of which he pays 2s. for his wretched tenement. If he were resident on the farm, the two and a-half hours of daily labour spent in walking might be expended in productive work; his labour would be worth, according to his own account, and I believe to a farmer's acknowledgment, 2s. 6d. per week more. For a rent of L.5, 5s., such as he now pays, he would be entitled to a good cottage with a garden; and his wife and children being near, would be available for the farm labour. So far as I could learn, there are between one hundred and two hundred agricultural labourers living in the borough of Reading, and the numbers are increasing. The last week brought to my notice a fact illustrative of the present unjust state of things, so far as regards the labourer. A man belonging to Maple-Durham lived in Reading; walked about four miles per day to his work, the same back, frequently getting wet; took fever, and continued ill some time, assisted by the Reading union in his illness; recovered, and could have returned to his former employment of 10s. per week, but found he was incapable of walking the distance; the consequence was, he took work that only enabled him to earn 5s. per week; he is now again unable to work. Even in Lincolnshire, where the agriculture is of a high order, and the wages of the labourer consequently not of the lowest, similar displacements have been made, to the prejudice of the farmer as well as the labourer, and, as will be seen, of the owner himself. Near Gainsborough, Lincoln, and Louth, the labourers walk even longer distances than near Reading. I am informed of instances where they walk as far as six miles; that is, twelve miles daily, or seventy-two miles weekly, to and from their places of work. Let us consider the bare economy, the mere waste of labour, and what a state of agricultural management is indicated by the fact that such a waste can have taken place. Fifteen miles a-day is the regular march of infantry soldiers, with two rest days—one on Monday, and one on Thursday; twenty-four miles is a forced march. The man who expends eight miles per diem, or forty-eight miles per week, expends to the value of at least two days' hard labour per week, or one hundred in the year, uselessly, that might be expended usefully and remuneratively in production. How different is it in manufactories, and in some of the mines, or at least in the best-managed and most successful of them! In some mines as much as L.2000 and L.3000 is paid for new machinery to benefit the labourers, and save them the labour of ascending and descending by ladders. In many manufactories they have hoists to raise them and their loads from lower to upper rooms, to save them the labour of toiling up stairs, to economise their strength for piece-work to mutual advantage. It is not in county and borough towns only that this unwholesome over-crowding is going on. I am informed

* Article, 'Serfdom,' No. 170.

that from the like cause the evil of over-crowding is going on in the ill-conditioned villages of open parishes. It is admitted, and made manifest in extensive evidence given before a committee of the House of Lords by practical farmers, that when an agricultural labourer applies for work, the first question put to him is not what has been his experience, what can he do, but to what parish does he belong. If he do not belong to the parish of the occupier, the reply is usually an expression of regret that he can only employ the labourer of his own parish. To the extent to which the farmer is directly liable to the payment of rates, by the displacement of a settled parish labourer, he is liable to a penalty for the employment of any other labourer who is not of the parish. To the same extent is he liable to a penalty if he do not employ a parish labourer who is worthless, though a superior labourer may be got by going further a-field, to whom he would give better wages. This labourer who would go further is thus driven back upon his parish; that is to say, imposed, and at the same time made dependent upon, the two or three, or several farmers, by whom the parish is occupied. He then says, "If this or that farmer will not employ me, one of them must; if none of them will, the parish must keep me, and the parish pay is as good as any." Labour well or ill, he will commonly get little more, and it is a matter of indifference to him: it is found to be, in all its essential conditions, labour without hope—slave labour; and he is rendered unworthy of his hire. On the other hand, in what condition does the law place the employer? It imposes upon him the whole mass of labourers of a narrow district, of whatsoever sort, without reference to his wants or his capital. He says, "I do not want the men at this time, or these men are not suitable to me; they will not do the work I want; but if I must have them, or pay for keeping them in idleness if I do not employ them, why, then, I can only give them such wages as their labour is worth to me, and that is little." Hence wages are inevitably reduced. What must be the effect upon the manufacturer if he were placed in the same position as tenant farmers are in the smaller parishes in the southern counties, if he were restricted to the employment only of the labourers in the parish? If, before he engaged a smith, a carpenter, or a mason, he were compelled to inquire, "To what parish do you belong?" Why, that the 24s. a-week labour would fall to 12s. or 10s., or the price of agricultural labour. Agriculturists from northern districts, who work their farms with 12s. and 15s. a-week free labour, have declined the temptation of low rents, to take farms in parishes where the wages are 7s. or 8s. a-week. Whilst inspecting a farm in one of these pauperised districts, an able agriculturist could not help noticing the slow drawing motions of one of the labourers there, and said, "My man, you do not sweat at that work." "Why, no, master," was the reply; "seven shillings a-week isn't sweating wages." The evidence I have cited indicates the circumstances which prevent the adoption of piece-work, and which, moreover, restrict the introduction of machinery into agricultural operations, which, strange though it may appear to many, is greatly to the injury of the working-classes; for wherever agricultural labour is free, and machinery has been introduced, there more and higher-paid labour is required, and labourers are enabled to go on and earn good wages by work with machines long after their strength has failed them for working by hand. In free districts, and with high cultivation by free and skilled labour, I can adduce instances of skilled agricultural labourers paid as highly as artisans. I could adduce an instance, bordering upon Essex, where the owner, working it with common parish labour at 1s. 6d. a-day, could not make it pay; and an able farmer now works it with free labour at 2s. 6d., 3s., and 3s. 6d., and even more, per day, for task-work, and, there is reason to believe, makes it pay well. A farmer, who died not long ago immensely wealthy, was wont to say that "he could not live upon poor 2s. a-day labour; he could not make his money upon less

than half-crowners." The freedom of labour, not only in the northern counties, but in some places near the slave-labour districts of the southern counties, is already attended with higher wages—at the rate of 12s., 14s., and 15s. weekly. In such counties as Berks and Bedford, the freedom of the labour market, when it came into full operation, could not raise wages less than 2s. a-week; and 2s. a-week would, in those counties, represent a sum of productive expenditure and increased produce equal to the whole amount of unproductive expenditure on the poor-rates.

It forcibly occurs to us, that of all the absurd social arrangements which still deform our civilisation, this of parochial settlement, attended as it is by such effects, is the most absurd. One can hardly believe that those who reared and now support such a system can be rational creatures. Strangest of all, while such horrible evils have been depressing the rural peasantry, the talkers and writers of our age have been looking in a totally different quarter for objects of philanthropic enthusiasm. The manufacturing operatives, who have twice the wages, with hoists to save them even the labour of going up and down stairs, have been the themes of bitter deploration, as if their condition were a foul plague-spot upon the country, while the peasantry have been supposed to exemplify something like the golden age, or the peace and comfort of Arcadia. Only now are facts beginning to dispel this monstrous delusion.

STRAY NOTES IN ZOOLOGY.

THE following anecdote, told by Mr Featherstonhaugh in his 'Canoe Voyage up the Minnay Sotor,' places the pig at a respectable elevation in the scale of discriminating intelligence:—"As we approached a farm on the American side of the St Clair river, belonging to the captain of our steamer, a curious fact fell under my observation. The pigs belonging to the farm came squealing down to the water-side, a thing which the persons at the farm assured me they never did when other steamers passed. The captain explained this singular recognition on the part of the pigs, by stating that the swill of his steamer was always preserved for them, and that, on reaching the landing-place, it was immediately put on shore to feed them. The animals having been accustomed to this valuable importation during the whole summer months, had learned to distinguish the peculiar sound which the steam made in rushing through the pipe of the steamer; and as they could do this at the distance of half a mile, they immediately, upon hearing it, hastened down to the river, whilst the noise made by the other steamers was disregarded." This is a curious instance of the possibility of sharpening the faculties of the lower animals by an appeal to their appetites, and a conclusive proof that the readiest way to make all swinish animals reasonable, is to provide plenty of swill for them.

Every one is aware of the ferocious contests which often take place among the higher animals during the season of love and gallantry; but few, we believe, will be prepared to find the same feeling raging as fiercely among the cold-blooded denizens of the waters, though the poet has long ago given his word for it, 'that even an oyster may be crossed in love.' Such, however, is the case, if we may credit the subjoined paragraph from the 'Elgin Courier':—"While several cutter-men (of the Preventive Service) were on their rounds the other day, and bearing along the Findhorn, between Glenferness and Dulcie Bridge, they observed an unusual commotion among the spawning beds of the ford. On approaching the spot, two large male salmon were seen engaged in mortal combat for the possession of a female. Never did chivalric knights contest for the hand of "ladye fair" more fiercely than those burly lords of the flood. The tranquil bosom of the stream was lashed into foam by the struggles of the finny antagonists; in the meantime the object of the fray was beating silently about, "spectatress of the fight." From the appearance of the stream—dyed with blood, and gradually assuming its former smooth surface—it was evident that the contest was over. One of the salmon at last flounders on the surface—dead; and the victor, it may be conjectured, exhaustedly bore off his prize. The men,

who had the curiosity to watch the fight, as a proof of their story, conveyed the dead salmon to the nearest dwelling. The victor had torn off the flesh along the back, from head to tail, to the very bone. In the movement of salmon-spawning, the males have often been seen chasing each other; but such a fray as this has not been witnessed by the oldest fisher or poacher on the Findhorn.

Mr Gardner, in his recently-published 'Travels in Brazil,' furnishes some additional information respecting the habits and character of the electric eel:—'In the Rio de Palma,' says he, 'as in all the rivers within the province of Goyaz, the *Gymnotus electricus* is exceedingly common. They are of all sizes, from a foot to six feet in length, and are frequently caught on the lines which are set for fishes; they are sometimes eaten, but not generally, although their flesh is said to be very good. Horses as well as men, by coming in contact with them in the water, are not unfrequently thrown down by the shock which they impart; they are called by the inhabitants *Treme-treme*. In rainy weather, those who fish in these rivers often receive a shock, which is communicated along the moisture upon the rod and line when one of them happens to seize the hook. I saw one in a state of captivity, about six feet long, which was so tame, that it would allow any one to put his hand upon it, and even slide for its whole length through the fingers; but if irritated in the smallest degree, by pinching it a little, it instantly communicated a smart shock.'

The same authority confirms the early accounts respecting the size and prodigious swallowing capacity of the boa-constrictor—accounts which certain naturalists, whose researches never extended beyond the galleries of a museum, are in the habit of treating with ridicule and unbelief. 'The boa,' says he, 'is not uncommon throughout the whole province of Goyaz, particularly by the wooded margins of lakes, marshes, and streams. Sometimes they attain the enormous length of forty feet: the largest I ever saw was at this place, but it was not alive. Some weeks before our arrival at Sapé, the favourite riding-horse of Senhor Lagoeira, which had been put out to pasture not far from the house, could not be found, although strict search was made for it all over the fazenda. Shortly after this, one of his vaqueiros, in going through a wood by the side of a small river, saw an enormous boa suspended in the fork of a tree which hung over the water: it was dead, but had evidently been floated down alive by a recent flood; and being in an inert state, it had not been able to extricate itself from the fork before the waters fell. It was dragged out to the open country by two horses, and was found to measure thirty-seven feet in length. On opening it, the bones of a horse, in a somewhat broken condition, and the flesh in a half-digested state, were found within it, the bones of the head being uninjured. From these circumstances, it was concluded that the boa had devoured the horse entire. In all kinds of snakes the capacity for swallowing is prodigious. I have often seen one not thicker than my thumb swallow a frog as large as my fist; and I once killed a rattlesnake, about four feet long, and of no great thickness, which had swallowed not less than three large frogs, one of which swelled out its sides to nearly twice the thickness of the other parts. I have also seen a very slender snake that frequents the roofs of houses, swallow an entire bat three times its own thickness. If such be the case with these smaller kinds, it is not to be wondered at that one thirty-seven feet long should be able to swallow a horse, particularly when it is known that, previously to doing so, it breaks the bones of the animal by coiling itself round it, and afterwards lubricates it with a slimy matter which it has the power of secreting in its mouth.'

Much has been said and written both for and against the ingenuity and imitative faculties of monkeys—these accounts, however, generally referring to the animals in a state of domestication and training. We have little recorded of their natural state beyond their chattering frolicsomeness, their shyness, their affection for their young, or their occasionally pelting some obtrusive traveller with rotten twigs or palm-nuts from the branches overhead. The following extract from the same traveller not only adds to our knowledge on this score, but exhibits the monkey tribe as capable of employing implements, if we may so speak, for the attainment of a certain end:—'The moist and marshy campos produce various kinds of palm-trees, which bear large clusters of small nuts, greatly resembling miniature cocoa-nuts. When ripe, these are covered externally with a fibrous oily substance, which has a sweetish

taste, and constitutes the favourite food of the little ring-tailed monkeys, which are no less fond of the internal part of the nut, which contains a kernel similar to that of the cocoa. In several parts of the interior, I had been told that, to get at this kernel, the shell being too hard to break with their teeth, the monkeys carry the nuts to a rocky place, and there break them with a stone; and I even met with persons who assured me that they had watched them in such places, and actually seen them engaged in this operation. This account I always considered to be fabulous till I arrived at Sapé. In an excursion we made over the Serra, where it is composed of nearly bare, rugged limestone peaks, in several almost inaccessible places, we came upon large heaps of the broken shells of nuts, generally on a bare open part of the rock, and along with them a number of roundish pieces of stone, larger than the fist, which had evidently been employed in breaking the shells. These, Senhor Lagoeira told me, were the places resorted to by the monkeys for the purpose of breaking the nuts collected in the low grounds; and that, in his shooting excursions over the mountains, he has frequently seen them take flight on his approach. That they both can, and really do, make use of a stone in order to break that which is too hard for their teeth, I have frequently witnessed in a little pet monkey that accompanied me on my journey. I obtained it in Piauihy, and it was the only one of the many tame animals I carried with me that reached Rio de Janeiro alive: it was a female of the species we are now speaking of, and ultimately became very gentle. Jerry was the favourite with all, and indeed in all respects fared like ourselves: it became so fond of tea, which it drank every morning and evening, that it would not go to sleep without its usual allowance. Its favourite food was farinha, boiled rice, and bananas; but scarcely anything came amiss to it. A raw egg was a choice morsel, and on being given to it, it broke one end by gently knocking it on the floor, and completed the hole by picking off the broken bits of shell, and putting in the point of its long slender finger; throwing back its head, and holding the egg erect between its two hands, it soon contrived to suck out the whole contents. Whenever anything was given to it that was too hard to break with its teeth, it always looked about for a stone, which it would hold in both its hands, and rising erect on its legs, would let it fall, leaping backwards at the same time, to avoid any injury to its toes.'

Wits and essayists are in the habit of setting up the penguin as their standard of awkwardness and stupid indifference: how far they are justifiable in doing so, let the reader of the following extract from Dr Von Tschudi's 'Travels in Peru' determine:—'A species of penguin, called by the Peruvians *Pagaro Nino*, or the Child Bird, is easily tamed, becomes very social, and follows its master like a dog. It is amusing to see it waddling along with its plump body and short legs, and keeping itself in equilibrium by moving its floating wings. I had one completely tame, which I bought from an Indian. It was named Pope, and readily answered to the name. When I was at my meals, he regularly placed himself beside my chair, and at night he slept under my bed. When he wished to bathe, he went into the kitchen, and beat with his bill on an earthen pan until somebody threw water over him, or brought him a vessel full of water for a bath.'

We are occasionally assailed by the anonymous abuse of parricidal naturalists for repeating what certain travellers have written respecting the dimensions and habits of the so-called bird-catching spiders of South America: what do such authorities say to the recent testimony of Dr Von Tschudi? 'At Quibco,' he says, 'I saw a bird-catching spider (*mygal*) of extraordinary large size. The back-part of the body alone measured two inches! Being at some distance, I supposed it to be one of the rodent animals, and I fired at it. To my mortification I discovered my mistake when too late, for the specimen was completely destroyed by the shot, and was useless for my collection. The Indians assured me that on the margin of the stream which flowed near the plantation, many larger individuals were to be found; but I never saw another of such remarkable size as the one I inadvertently destroyed.'

The vampire, or blood-sucking bat, which were also so long regarded as fabulous, are thus spoken of by the same recent authority:—'Not less troublesome are the leaf-nosed bats (*phyllostoma*), which attack both man and beast. This bat rubs up the skin of his victim, from which he sucks the blood. The domestic animals suffer greatly from the nocturnal attacks of these creatures, and many are destroyed

by the exhaustion consequent on the repeated blood sucking. The blood drawn by the bat itself does not exceed a few ounces; but if, when satisfied, it drops down to the ground, or flies away, the wound continues to bleed for a long time, and in the morning the animal is often found in a very weak condition, and covered with blood. One of my mules, on which a leaf-nosed bat made a nightly attack, was only saved by having his back rubbed with an ointment made of spirits of camphor, soap, and petroleum. The blood-suckers have such an aversion to the smell of this ointment, that on its application they ceased to approach the mule. These bats are very mischievous in the plantations of the forests, where beasts of burden and horned cattle are exposed to their attacks. Whether they venture to assail man, has been a much-disputed question. Several travellers declare they do not. I may, however, mention a case which occurred within my own knowledge. A bat fastened on the nose of an Indian lying intoxicated in a plantation, and sucked so much blood, that it was unable to fly away. The slight wound was followed by such severe inflammation and swelling, that the features of the Cholo were not recognisable. This account is confirmed by Mr Gardner, the Brazilian traveller, who believes that the puncture which the vampire makes in the skin of the animals is effected by the sharp-hooked nail of its thumb, and that from the wound thus made it abstracts the blood by the suctorial powers of its lips and tongue.

THE BUTCHERS OF PARIS.

PREVIOUS to the Revolution, the butchers of Paris were subjected to a number of vexatious rules, which have since been considerably modified. A great improvement was effected in 1810. By a decree of Napoleon in that year, all private slaughter-houses were abolished, and in their stead five public *abattoirs*, under strict regulations, were established: and thus, thirty-seven years ago, Bonaparte effected for Paris what till this day our legislature has not had the intelligence or the fortitude to accomplish for London or any other city.

To the emperor also is owing the institution of a general market for the sale of meat; but it is not much prized, and the more respectable butchers keep shops throughout the city and environs. The number of Parisian butchers is limited to five hundred. There were but three hundred and ten in 1822. Thirty of the whole number, designated by the prefect of police, and of whom ten are selected from the least influential of their class, nominate a syndic and six associates. The syndic, two associates, and one-third of the electors, are renewed annually by lot. A butcher cannot establish himself at Paris without the permission of the prefect of police, granted by the advice of the syndics and associates; and a guarantee of three thousand francs is moreover required from a candidate. Numerous ordinances of police regulate the relations of the butchers with the public, prevent the sale of unwholesome meat, and prescribe the measures to be taken for the proper management of the market stalls.

The traffic in beasts for the provisioning of Paris can only take place at the markets of Sceaux and Poissy, the *Marché aux Vaches Grasses*, and the *Halle aux Veaux*. The Bank of Poissy, instituted in 1811, pays ready money to the drovers and country cattle merchants for all the purchases made. It is under the surveillance of the prefect of the Seine, and its funds are composed of the guarantee deposits made by the butchers, and sums accruing from an open credit account managed by the said prefect.

Many of the more wealthy butchers are addicted to the unlawful commerce called *vente à la cheville* (literally, sale by the piece). They purchase entire animals, and sell the meat in detail to their less fortunate colleagues. As this species of traffic is considered to be injurious to the levying of duties at the barriers on live animals which enter the city, it is made illegal, and therefore many poor families suffer. A general council of the department of the Seine prayed for a relaxation of the protective duties in 1838 and 1839. A petition of the butchers to the same effect was forwarded in 1840 to

the ministers of commerce and finance; but the legislature would not comply, to the lively satisfaction of the country graziers, and the great displeasure of the consumers.

The butchers for a long time fostered a race of gigantic dogs, which, harnessed to little carts, dragged the meat from the *abattoirs* to the shops. Since this species of equipage has been proscribed, they have substituted serviceable steeds, and hence we find so many butchers among the cavalry of the National Guard. Their guard days are days of feasting and indulgence. After an ample breakfast, they pass the day in drinking punch, in gambling, and in noisy conversation, consisting of little else than the terms of the game they play.

One fine day, in the summer of 1824, a butcher returning from Poissy in his cart observed before him one of the court carriages, containing her Royal Highness the Duchess de Berry. He was a liberal, no very zealous partisan of the royal family, and thought it would be a glorious thing to outrun, with his good dapple-gray, the six horses of the princely equipage. He starts at a gallop, distances her highness, suffers her to resume the advantage, commences a new contest, and is again the victor; and repeats this exploit many times with the same success. The next day, the duchess having sent to him with a polite demand to inquire whether he would sell his horse, he replied with haughtiness, 'I can feed my horses as well as madame: my circumstances allow it.' This could be considered only a piece of gratuitous insolence, for no doubt the duchess reasonably concluded that the man had been showing off his horse in the hope of disposing of it to her. The truth is, the Parisian butchers are a coarse, unmannerly set of people, the descendants of a generally cruel and reckless portion of the community. The stallmen and shopkeeping butchers are usually superior, in point of polish, to the slaughtermen; still, even of them not much good can be said.

On the Thursday which precedes *Jeudi gras*, or fat Thursday, oxen of colossal size are led to the market of Poissy; and the fattest, ornamented with streamers, exposed for sale in the middle of the market-place, is soon surrounded by a circle of bidders, who dispute the honour of his possession. It is not the desire of gain which animates them; it is rather the love of glory, the ambition of being mentioned in the journals, the honour of sending a sirloin to the king of the French, and of occupying, though but for a day, the first rank among their colleagues. The biddings go on with spirit and eagerness, and mount up with reckless extravagance and rapidity: the victory hangs for a moment undecided, and the fear of ruin barely restrains the eager candidates.

The victor consigns his purchase to the *abattoir*, whence the animal starts in procession precisely at nine o'clock on the morning of the following Sunday. A document headed '*L'Ordre et la Marche du Bœuf gras*,' circulated through Paris, has aroused the population of the city, which is everywhere concentrated upon the route of the monstrous beast.

A troop of drummers and musicians, and the butcher proprietor of the beast, head the procession; the latter mounted on the best horse he can procure. These are followed by a party of the municipal guard, and then come files of butchers' workmen on horseback, and masked, knights with paper helmets, Turks glittering with spangles, firemen with glazed hats, mock military, charcoal-men, lightermen; in a word, all the odd and grotesque figures of the city. In the midst of the cavalcade walks the huge ox, in full dress, escorted by a swarm of savages in tight flesh-coloured suits, brandishing enormous clubs of coloured paper, with monstrous sham beards, and their heads bristling with feathers, such as travellers and poets depict the human biped in his unsophisticated state. Behind comes an ornamental car of wood and canvas, conducted by old Time, and containing Venus, Mercury, Hercules, and a little curly-headed boy, who takes the title of Love. This brilliant

assembly perambulates the town on Sunday, and on the following Tuesday (*Mardi gras*) pays its homage to the king and to the ministers, by whom a handsome donation is annually made, after which the procession returns to the abattoir. Then, alas! the animal-god, despoiled of his rich and splendid accoutrements, is ruthlessly immolated by those very devotees who but a moment before seemed ready to sacrifice to his honour.

The expense of this ceremony was formerly borne by the butchers, who dedicated the sums they received from the public and their patrons to the desirable consummation of a ball and a banquet. But now the directors of the abattoirs receive everything, even the sums given by the king and the ministers, and defray all expenses. To them is due the invention of the mythological car. Such is one of the annual festivals—or, we might more properly say, follies—of the Parisian populace.

HONG-KONG.

Hong-Kong, our recently-acquired possession in China, is one of the largest islands near the mouth of the Canton river. Its length from east to west is about eight miles, and its greatest breadth not more than six. Its outline is extremely irregular, here jutting out into abrupt promontories, and there receding into narrow creeks or bays, which often reduce its breadth to little more than three miles. Imagine, then, an island considerably longer than it is broad, perfectly mountainous, and sloping in a rugged manner to the water's edge, having here and there deep ravines almost at equal distances along the coast, which extend from the tops of the mountains down to the sea, deepening and widening in their course. There are immense blocks of granite in these ravines, which have either been bared by the rapid currents of water in its descent during the rain, or which have tumbled from the mountain-sides at some former period. The water in these ravines is abundant and excellent; hence the poetical name which the Chinese have given the island, Hong-Kong, or, more properly, Heang-Keang—'The Island of Fragrant Streams.' There is very little flat ground on the island capable of being brought under cultivation; indeed the only tract of any extent is the 'Wangnai-Chung,' or, as the English call it, 'The Happy Valley,' about two miles east from the town; and even that is not more than twenty or thirty acres in extent. There are several small plots of ground near the bottom of the hills, and some few terraced patches among them, but the whole is of a very trifling extent. From this description, it will be seen that our settlement of Hong-Kong is entirely dependent on the dominion of his Celestial majesty for supplies, which he of course can cut off when he pleases.—*Fortune's Wanderings in China.*

THE LATE MR TOPPING OF THE NORTHERN CIRCUIT.

We have received rather an interesting note, from one of the family, on the subject of the humorous anecdotes of Mr Topping we gave in No. 165, from the 'Law Review.' It seems that Mrs Topping, to whom he addressed such irritable letters every day, was 'enthusiastic and imaginative, and warmly attached to him, so that her replies (*daily also*), full of sympathy, fanned the flame, if there was any cause for irritation.' The following lines, addressed by Mr Topping to his wife, will be read as the evidence of a warm and kindly heart:—

'ON RECEIVING A PURSE FROM MY DEAR MARGARET.

Thy much-loved gift I'll freely take,
And wear it for the donor's sake:
If gold increase, this magic charm
Will all its baneful power disarm.
Of wealth, of friendship, love, possessed,
His lot in life is surely blessed,
Who thus with pious truth can own
His grateful heart is thine alone.'

A CONSOLATORY PRECEDENT.

All degrees of nations begin with living in pigsties. The king or the priest first gets out of them, then the noble, then the pauper, in proportion as each class becomes more and more opulent. Better tastes arise from better circumstances, and the luxury of one period is the wretchedness and poverty of another.—*The late Sidney Smith.*

THE PORTRAIT.

OH SHE WAS FAIR! This is enough—and much:
For these are magic words, where lies a spell
That utters more than eloquence can tell;
And by its power, with many a fairy touch,
The limner Memory on the heart doth fling
Those traits of beauty, that in other years
Long past, seemed born for ever there to cling,
Now dim with time, or blotted out with tears;
And youthful fancy, that hath ne'er been lit
By woman's smile, hath a dim consciousness
Of beauty near, like shadowy dreams that flit
Around our haunted slumbers, from above,
Mute and mysterious; and idolatrous love
Falls down and worships in his wilfulness
The form himself hath on the altar set.

Her hair, what colour? In most artful thrall
Confined a coronet wreath its graceful flow?
Or showered it, streaming o'er her breast of snow,
Love's net, to catch men's willing hearts withal?
Enough—'twas beautiful! And straight each heart
Beholds a portrait of its own, than art
Could paint more lovely and more glowing, where
Tresses confined or flowing, black or fair,
Orbs bright or melting, dark or heavenly blue,
Cheeks softly pale, or of 'love's proper hue,'
Are all unlike, although when gazing there,
Each seems divine adoring eyes declare,
And the soul's echo sighs—Oh she was fair!

L. R.

SELF-KNOWLEDGE.

To know one's-self, one would think, would be no very difficult lesson; for who, you will say, can be truly ignorant of himself and the true disposition of his own heart? If a man thinks at all, he cannot be a stranger to what passes there; he must be conscious of his own thoughts; he must remember his past pursuits, and the true springs and motives which in general have directed the actions of his life: he may hang out false colours and deceive the world, but how can a man deceive himself? That a man can, is evident, because he daily does so. Though man is the only creature endowed with reflection, and consequently qualified to know the most of himself, yet so it happens that he generally knows the least. Of all the many revengeful, covetous, false, and ill-natured persons whom we complain of in the world, though we all join in the cry against them, what man amongst us singles out himself as a criminal, or ever once takes it into his head that he adds to the number? What other man speaks so often and so vehemently against the vice of pride, sets the weakness of it in a more odious light, or is more hurt with it in another, than the proud man himself? It is the same with the passionate, the designing, the ambitious, and some other common characters in life. Most of us are aware of, and pretend to detest, the barefaced instances of that hypocrisy by which men deceive others; but few of us are upon our guard, or see that more fatal hypocrisy by which we deceive and overreach our own hearts.—*Manuscript Sermons.*

TEA-DRINKING IN CHILOE.

The mode of drinking tea, as practised by the ladies of Chiloe, in South America, is at once unique and original. Their favourite beverage, according to Dr Von Tschudi, is *maté*, or Paraguay tea, of which they partake at all hours of the day. The mode of preparing and drinking it is as follows:—A portion of the herb is put into a sort of cup made from a gourd, and boiling water is poured over it. The mistress of the house then takes a reed or pipe, to one end of which a strainer is affixed, and putting it into the decoction, she sucks up a mouthful of the liquid. She then hands the apparatus to the person next her, who partakes of it in the same manner, and so it goes round. The mistress of the house and all her guests suck the aromatic liquid through the same pipe or *bombilla*.

FIRESIDE MYTHS.

Amongst simple popular tales, there are many which are met with in application to more places than one. I shall endeavour to recall the class by a few examples.

Visit almost any first-rate Gothic church of the middle ages, and you are sure to be regaled with a story of an apprentice who built an extraordinary pillar. The master architect wished to make one pillar of surpassing beauty. He travelled to obtain ideas for the purpose. Meanwhile the apprentice, out of his own genius, executed the pillar, which the master no sooner saw on his return, than he fell upon the ambitious youth and killed him. The story must be true, for see, there is in one corner the rueful face of the alain lad with a gash on the brow; and there, in another, is his mother weeping for him! Among many places where this story is localised, is Roslin chapel, a singularly beautiful though small specimen of the florid Gothic, near Edinburgh.

In a lonely vale lies a beautiful lake of almost unknown depth. Such a lake is that of Wensley Dale in Yorkshire, which, however, the country people believe to have once been only a small mountain rill called Simmer-water. In those days there stood upon the banks of the rivulet a great city. One day a wayfarer, barely clothed, hungry, and penniless, but yet of noble and engaging aspect, came thither soliciting alms and shelter. He sought in vain, and then turned eastward down the vale. Now, fast without the bounds of the city there lived an aged couple, too poor and mean to be allowed to take up their residence within the precincts of this proud and inhospitable town. Into their dwelling the stranger betook himself, and ere he had told his tale of woe, they placed before him the best their house afforded—namely, a little bowl of milk, some cheese, and an oaten cake. Having satisfied his hunger, he bestowed upon them his blessing both in basket and in store. Beneath their roof was his dormitory for the night. On the morrow he repeated his benison, which was attended with the effect of making his hosts increase from that day in worldly wealth. Being then ready to depart, he turned his face to the west, and uttered this malediction—

'Simmer-water rise, Simmer-water sink,
And swallow all the town but this little house,
Where they gave me bread and cheese, and *sommat* to drink.'

Immediately the earth made a hissing noise, the stream overflowed its bounds, and the city was buried in a deep flood. If you are incredulous of the tale, take a boat and sail over the lake on a calm day, and you will see (with some little assistance from those having faith) the tops of the houses and spires of the churches, which still stand after a lapse of more than a thousand years. Lough Neagh in Ulster is a similar example of a pool

that has submerged a city; and this a well-known poet alludes to—

'On Lough Neagh's bank, as the fisherman strays,
When the clear cold eve's declining,
He sees the round towers of other days
In the wave beneath him shining.'

The lake of Grand-Lieu, in Brittany, is another of these ravenous waters, and is supposed to disgorge to this day fragments of carved wood, the relics of a city submerged in the first centuries of our era.*

The popular account of the building of Stonehenge is a capital example of these fireside tales. To quote a local reporter:—'The prophet Merlin, desirous of having a parcel of stones which grew in an odd sort of form in a back-yard belonging to an old woman in Ireland, transported thence to Salisbury Plain, employed the devil upon the work, who, the night after, dressing himself like a gentleman, and taking a large bag of money in his hand, presented himself before the good woman as she was sitting at her table, and acquainted her of the purchase he was come to make; the fiend at the same time pouring out his money on the board before her, and offering her as much for the stones as she could reckon while he should be taking them away. The money was all in odd sorts of coins—such as four-penny-halfpenny pieces, ninepenny pieces, thirteen-penny-halfpenny pieces, and the like—but nevertheless

* The Zuyder Zee in Holland, in like manner, stagnates over the city of Stavoren, drowned in consequence of the impetuosity of a female merchant. This lady, expecting the arrival of precious merchandise, was so much disappointed on receiving instead merely a cargo of corn, that in her rage she commanded it to be thrown overboard into the harbour. In vain the starving poor supplicated a portion—bag after bag, the grain sunk into the bitter waters; and the same night the sea rose over the city, which disappeared for ever. The site of its harbour, however, is still designated by long reedy grass (for corn, it may be supposed, degenerates in salt water) waving above the surface, and the name it retains to this day of *Frauen's Sand*, or the *Lady's Bank*.

The lake of Laach, near the Rhine, occupies a cavity resembling the crater of an extinct volcano. The water is disagreeable to the taste, of a blue colour, and deadly cold, though it never freezes; and in consequence of some ancient malediction—if we are to believe tradition against the testimony of our senses—no bird can fly over its surface and live. The key to the story is a pit on the eastern bank, which exhales carbonic acid gas in considerable quantities.

Sometimes, however, instead of lakes being formed, existing waters disappear. A plain between Heidelberg and Darmstadt, dotted with small hills, which rise up like islands, and surrounded by the steep sides of the mountains, which look as if they were intended to form a breastwork against the waves, was formerly, it seems, the bed of a lake. A necromancer, who had kept the country in terror, was seized by the prince and hung up in the air in an iron cage, so as to render his charms unavailing: in which predicament he proposed, by way of ransom, to dry up the lake, and convert the spot into a fertile plain. The terms were accepted; and hence the sandy flat near Darmstadt, where the waters disappeared, and the celebrated whirlpool at Bingen, called *Bingerloch*, where they rose up again to mingle with the current of the Rhine.

the devil's proposals seemed so very advantageous, that, notwithstanding the difficulty there would be in reckoning the money, the old woman could not avoid complying with it, as she imagined the removal of the stones by a single man would be a work of almost infinite time, and that she should be able to tell as much money while it should be about as would make her as rich as a princess. But the bargain was no sooner made, and she had no sooner laid her fingers on a four-penny-halfpenny coin, than the devil, with an audible voice, cried out, "Hold!" and "The stones are gone!" The old woman, disregarding what he said, however, peeped out into her back-yard, and, to her great amazement, it was even so as Satan had spoken; for the common deceiver of mankind in an instant took down the stones, bound them up in a withe, and conveyed them to Salisbury Plain. But just before he got to Mount Ambre the withe slackened, and as he was crossing the river Avon at Bulford, one of the stones dropped down into the water, where it lies to this very hour; the rest were immediately reared up on the spot of ground destined for Merlin for them: and the devil, pleased with the accomplishment of his work, declared, upon fixing the last stone, that nobody should be ever able to tell how the fabric, or any of the parts of which it is composed, came there. A friar, who had lain all night concealed near the building, hearing the devil's declaration, replied to it by saying, "That is more than thee canst tell;" which put Satan into such a passion, that he snatched up a pillar and hurled it at the friar, with an intention to bruise him to dirt; but he running for his life, the stone in its fall only reached his heel, and struck him on it; the mark of which appears in that pillar even unto this day, and is called *The Friar's Heel*.*

There are similar stories to this regarding the building of many other great structures. In Scotland, Dumbarton Castle was reared by a witch, who compelled the devil to bring the stones to her from Ireland: he dropped one by the way, and behold it in the Firth of Clyde to this day, in the goodly form of Ailsa Craig! Most old buildings of magnitude in our northern land are ascribed to a people called the Pechts, 'of stature short, but genius bright,' as Burns says of Captain Grose, and who handed forward the stones from one to another between the quarry and the masonry. In Ireland, such structures are believed to have been the work of certain wandering masons of gigantic stature, called the Gobbans. Perhaps the Cyclops of the Greeks were to them what the Pechts are to the Scotch and the Gobbans to the Irish. There is also in Scotland a very peculiar class of stories about old buildings. When the situation of the edifice is at all peculiar, as in a bog, we are sure to hear that it was first designed to be somewhere else; but, as the walls rose, everything that was done during the day was by supernatural agency undone at night, till at length a voice gave directions for the structure being commenced in another place—which order being obeyed, there was no longer any difficulty. I have had occasion to trace this story in Lanarkshire, Fifeshire, Forfarshire, and even in places still more remote from one another.

Till very lately, these fireside prattlings were disregarded; but now it is seen that there are principles in them reflecting some light upon great investigations. They take their place among those myths to which learned writers have latterly directed no small degree of attention.† A myth may be described as a history of a person or thing which has not originated in facts, but in suggestions which the person or thing was calculated to awaken in unenlightened minds. Thus, such a mind contemplating a lake which fills a valley, and seeing other valleys occupied by hamlets and towns, imagines

that this vale may have been once occupied by towns also. From dreaming this to setting it forth as a fact, is but a step. A natural tendency to exaggeration makes the town a large one—a city, with towers and spires. A reason for its submersion is easily imagined: persons in humble life having a tendency to believe themselves exclusive possessors of the virtues, nothing is more natural than to suppose the event to have been owing to the selfish wickedness of these proud citizens. Behold furnished forth a myth! So also as to the Prentice's Pillar. It had been a whimsical practice of the mediæval architects to have one column excessively decorated. In after-times, the same disposition to attribute great qualities where they are least to be expected, suggested that this was the work of an apprentice. The killing of the youth is but a naturally supposable result of such an insult to the master. Against this reading of the tale, it is no obstruction that perhaps, in such late instances as Roslin, where the prentice and his mother are sculptured, the pillar was owing to the already existing legend. Stonehenge, in like manner, suggests the fictitious account of its structure. A stray boulder in the bed of the Avon lends corroboration, if it did not help to the making of the story. As to old buildings in general, their origin is beyond the ken of the common people; seeing how much they exceed the powers of the thin population now living at the spot, the idea of a different aboriginal people as their constructors unavoidably arises. And so a tale of Pechts, Gobbans, or Cyclops takes its ground. Even an unexpected situation for a building is obviously qualified to start some similar supposition as to its cause, and thus to raise a legend on the subject.

All natural objects of a singular nature have their explanations from the popular imagination before they fall under the regard of science. The scattered Celts of the northern glens, seeing one or two of those recesses marked with broad flat terraces, which stretch for miles along the hill-sides—a grand and mysterious-looking object—speedily have it settled amongst themselves that those terraces were roads made for hunting by their early hero Fingal, himself a mythic personage. It required a careful examination from minds instructed in such knowledge, to ascertain that they were the margins of a lake which had sunk through a succession of levels, according as its boundaries were reduced.* Even to the present day, the Celt is by no means over-pleased to abandon his own dream for this conclusion. The channel of Sapey brook in Herefordshire consists of a long stripe of old red sandstone, enclosed between high banks, and along the surface of the stone are a series of marks, resembling the footsteps of a horse and colt, and those of a person walking on pattens. There can be no doubt with geologists that these are the traces of fossils or concretions which formerly existed in the surface of the rock; but very different from this is the account given of them by the common people thereabouts. By a process the most intelligible imaginable, they have got up a story of a St Catherine, who lived at Burton, having had a horse and foal stolen from her by a girl wearing a pair of pattens, by whom the two animals were conducted along the channel of the brook for concealment. Discovering the loss of her property, the saint prayed that the feet of the thief, the horse, and colt, might leave indelible marks wherever they went. Accordingly, the rock in the channel of the brook became impressed with the three sets of footsteps.

* This was the conclusion at which Sir Thomas Dick Lander arrived in an excellent paper on the Parallel Roads of Glenroy, in the Transactions of the Royal Society of Edinburgh. The ingenious Mr Darwin, so distinguished by his South American Travels, has since obtained a temporary predominance for a theory which represents the terraces as produced by the sea, in the course of an uprise of the land from that element. The present writer is now satisfied, from personal examination of the country, that the latter idea is untenable, and that incontrovertible evidence exists for establishing the explanation of Sir Thomas Dick Lander. Of this evidence an able view has lately been brought before the Royal Society of Edinburgh by Mr David Milne, advocate.

* A Description of Stonehenge on Salisbury Plain. Pp. 2-5. Salisbury, 1803.

† See Müller's Introduction to a Scientific System of Mythology. Translated from the German by John Leitch. London: 1844. Also Grote's History of Greece, vol. I.

Here the process of the fabrication of the story is palpable, and the girl and her act, as well as the two animals concerned, are merely ideas excited by the appearances, since transformed, in perfect good faith, into a history.

The truth is, that *might* be unavoidably leads to *is* or *was*. Let any appearance be presented to us in a striking manner, and it speedily becomes alive with the vagrant notions of our brains, first set forth perhaps as fancies, but soon petrified into realities. Cumberland tells us in his 'Lives of the Spanish Painters,' of a beautiful Virgin Mary painted by a distinguished artist upon the ceiling of a church. The Catholic believes that the Virgin performs miracles to this hour. He also knows that a painting on a ceiling has to be done by the artist lying on his back, in somewhat dangerous circumstances, upon a scaffold. Accordingly, it is not wonderful that visitors to the church are told of a wonderful deliverance for which the painter was indebted to the creature of his pencil. He had nearly completed his work; he was surveying it in mute and pious rapture; totally forgetting himself, he slipped from his proper place, and was about to be dashed on the floor below, when the Virgin put out her arm and upheld him! It is a simple result of a law of the mind with regard to the circumstances, that this story should have been conceived, and told, and believed.

Most superstitions and mythologies have probably had no other source than in the suggestions of actual circumstances and events. It has been remarked that the Greeks of Asia Minor, seeing the sun set in glory upon the mountains beyond the sea to the west, might very naturally conceive the idea of an Olympus which was the residence of the gods. *Ætna* and its subterranean noises were equally calculated to engender the idea of Vulcan and his occupations. Müller has pointed out how, among those divine-minded Greeks, abstractions were continually being crystallised into persons. Not long since, an author endeavoured, in a very plausible manner, to show how, among heathen nations, the sea-stratified sand, found at great elevations in so many places, was quite sufficient to suggest the notion of a universal flood, which is found almost everywhere prevalent amongst them. The fairies are a wide-spread superstition; but can anything be more natural than to suppose a kind of ideal forms, more beautiful than those of common mortals, pursuing an obscure nocturnal existence, and occasionally traversing the course of human destiny? We only do not know the real history of these things, because the transition from the *possible* to the *actual* is performed so quickly in the popular mind, and at so early a period in its growth, as to escape enlightened observation. Even the gross superstition of witchcraft is only an idea of the malignity which occasionally besets the human heart, made tangible, and carried out into its contemplated effects. Simple man loves the kind greetings and the parting good wishes of his friends: he attaches consequence to these things, as if they could have an influence over his fortunes. It is equally natural for him to dread evil wishes and denunciations. Hence his horror of misanthropic old women—hence witchcraft. Some superstitious stories, which are told in many places with little variation besides that of persons, may be traced to the same metaphysical origin. There is one which represents a young man as selling his soul to Satan, for the sake of some too-much desired object—as learning, or a mistress, or gold—and being afterwards with difficulty saved by means of a pious clergyman, who tricks the enemy out of his pledge. Who can fail to see here the mere *supposable* creating the *actual*? Another represents a hare wounded by a shot in passing across a field. The animal mysteriously disappears; but that forenoon, a noted Sycorax of the neighbourhood is obliged to send for a surgeon to heal a broken limb. This story is told everywhere in our country, with slightly varying circumstances. It is of course only a supposition converted into reality.

In the records of heraldry might be found many examples of such reflective creations. From the Scottish genealogist, we have the family of Lesly originating in a person who,

'Between the less ice and the mair,
Slew the knight, and left him there;'

and that of Douglas, from a dark-gray man [*dhù glas* being Gaelic for dark-gray]; the simple fact being, that both names arose in the usual manner from the places where the first man of the family lived. 'A singular mistake,' says Mr Lower, in his *Curiosities of Heraldry*, 'prevails among the vulgar respecting the bloody hand borne in the arms of baronets. I have been very seriously and confidentially told that murders had been committed by the ancestors of such and such families, and that the descendants were compelled to bear this dreadful emblem in consequence. According to the same sapient authorities, it can only be got rid of by the bearer's submitting, either in his own person, or by proxy, to pass seven years in a cave, without either speaking or cutting his nails and beard for that length of time! The intelligent reader need not be informed that this supposed badge of infamy is really a mark of honour, derived from the province of Ulster in Ireland, the defence and colonisation of which was the specious plea upon which the order of baronets was created by James I.' This is a particularly valuable example, as it shows us the popular fancy working out its tale in a definite time, and that by no means of great extent.

It is humbly conceived that there may be some profit from such an examination of the mental processes by which fireside myths are produced. It may be to many a first lesson in the important business of truth-seeking. The world is yet full of actualised abstractions handed down from infant mankind. They form a portion of every history, and of almost every philosophical system. Nor does there pass a day even now, which does not witness the process of fabricating history, biography, and common anecdote, out of the suggestions connected with the respective subjects. It is well to be put on our guard against such things, for they are the very thorns and brambles which beset the path of truth. I contemplate, however, a superior advantage in merely leading the minds of my readers to follow a line of inquiry by which error may be detected. Every thought we give to an earnest effort for the discrimination of truth and delusion, must carry with it an increase to the power of the mind, as well as some improvement to its conscientiousness. I therefore hope that, even in this slight paper, there may be the elements of a mental discipline which will advance not a few in the scale of thinking beings.

CONSTANCY.

'THERE is a tale of old St Monan's harp, that when the pilgrim minstrel was no more, it uttered but one sound whoever touched it; however gay, however glad or lightsome, was the tune that any other finger tried to play, a long, long sigh was all the sound that came.'

'What an exquisite idea! How beautiful—how full of poetical feeling!' exclaimed Elizabeth Monro, as, closing her book with a responsive sigh, she leant back in her easy-chair, and surrendered herself to the fancies awakened by these words. Her mother, who had been silently working at the other side of the fireplace while Elizabeth read, now looked up, smiling at the mournful cadence with which the little sentence had been uttered; but her smile faded into seriousness as she met the abstracted look of her young daughter, and recognised the workings of a too vivid and romantic imagination in her varying cheek and dreamy eyes. Happily she was aware those symptoms resulted from imagination alone; and though the anxious expression lingered on her countenance, it lent no gravity to her tone as she answered, 'I should say, most fanciful, most poetical, or even beautiful, if you will; but, dearest Elizabeth,

in what consists its mournful truth, or where are we to find its parallel?

With half indignant eagerness Elizabeth raised herself from her indolent position, and impetuously exclaimed, 'Oh, mamma! how can you ask? Surely its echo is found in every loving, constant heart?'

Mrs. Monro's smile returned as she asked, 'The echo of what, Elizabeth?—of the long, long sigh? Alas for the loving, constant heart, were that to be its only occupation and reward!'

But it was with a still more earnest look Elizabeth replied to her mother's half-bantering tone and words. 'Mamma, I do think there is something mournful in the idea of constancy: does not its very existence imply somewhat of delay and disappointment, and hope deferred—a strain upon the heart till hope is over, and then a grief incurable, irremediable, till life itself is past?'

The tears that shaded Elizabeth's soft eyes bespoke her full conviction of the truth of this description, and checked the smile that still was lingering on her mother's lip. For a moment Mrs. Monro paused, and then with gentle seriousness she answered—'Not so, my child; not such is the meaning that I would attach to constancy. Oh how differently the word strikes upon my ear, upon my heart! You look upon it as a sentiment; you confine it to one passion; you make it the handmaid of weak hearts, paralysing even their puny strength; while I regard it as a principle existing in noble minds; prompting to noble deeds; imparting fortitude, endurance, perseverance, instead of passively supporting a morbid state of feeling, or encouraging an obstinate resistance to circumstances—an opposition to the judgment of wiser and more experienced heads.'

As Mrs. Monro spoke, her eyes involuntarily rested on an old portrait which hung upon the opposite wall, and following the look, with an arch smile Elizabeth exclaimed, 'If there be truth in tradition, we have at least no example of constancy there!'

Her mother turned on her a look of pained inquiry as she asked, 'Elizabeth, where did you learn that? I was just going to select the original of that portrait as affording beyond all, or any I had ever known, the best exemplification of my opinion; the best proof that even in the quiet circle of domestic life, the constant heart may become a refuge of strength, not only for its own support, but for the happiness of all within its sphere. Look attentively for a moment at that countenance, and tell me—even had you never been acquainted with her it represents, never heard or known aught of her life or character—what would be the impression those features would convey?'

With a deprecating gesture, as if the study were indeed superfluous, Elizabeth rose in obedience to her mother's wish, and perused more closely those lineaments, so well known and well beloved. It was the portrait of a lady, matronly, but not advanced in life; an air of serene thoughtfulness seemed to add more years than time had reckoned, and gave intelligence and decision to features cast in nature's gentlest and most feminine mould. Elizabeth looked long and thoughtfully at that sweet face; and even after she had returned to her seat, still fascinated, bent her gaze upon it, until a question from her mother reminded her that she had not given the desired opinion yet. Starting, she hurriedly exclaimed, 'Oh, mamma! who could read aught but truth and honour on that clear, expressive brow; or detect one fickle wavering line in the whole of that earnest face? And yet—' She paused, apparently unwilling to qualify her testimony, but gave her mother an appealing look, as if she too must be aware that something in the experience or history of that individual contradicted the fair promise pictured there.

Mrs. Monro took up the unfinished sentence. 'And yet—you have possibly heard, that, fickle and untrue to her earliest attachment, she wedded another for the sake of house and lands, while he that loved her first was far away, winning in other lands the gold which

was to have made her his. I knew that, long ago, some such story had been spoken, but hardly thought it could have survived its little day, outlived her blameless, admirable life, to find at last a resting-place in the bosom of one of her descendants.' She paused abruptly, while Elizabeth, surprised and grieved at this unusual reproof, hastened, with words full of gentleness and affection, to apologise for her involuntary fault.

Conquering her momentary emotion, Mrs. Monro more calmly continued—'You remember that dear parent, Elizabeth, and with a memory full of reverence and love; of that I am convinced, even though you thus lightly spoke. But had you known her as I did—had you been honoured with her confidence—had you been of an age to appreciate her rare and noble heart before that heart was stilled—you would not wonder that it was with a feeling akin to some sudden bodily pain I saw her memory wronged by a child of mine—of hers. And now, to remove that impression for ever, listen to me. I need not, perhaps, tell you of her earliest years, how she lost her mother before she knew her, and was brought up entirely beneath a father's eye. I do believe he must have been such a father as those harsher times rarely exhibited, for he sacrificed ambition, and every former predilection, to devote himself to his little helpless child. Descended from an ancient family, and the last of his line, and hitherto most desirous of an heir, he resisted every temptation to a second marriage, fearing to place a stepmother over his darling, and reconciled himself to the disappointment of not having a son, by feeling that there was no child in Christendom for whom he would exchange his daughter. Thus he loved her, while she, unacquainted with any other experience, accepted his deep affection as the usual expression of parental love, and imagined that every child in the world was as fortunate as herself. Thus in happy ignorance she passed through her nursery, her school-room days; their period abridged by her lonely father's anxiety to have her seated beside him in his library, while he directed even her childish studies himself.

'One day he was unusually grave, and answered her remarks and questions absently, while now and then he would lay down his book, and re-peruse a letter which lay beside him on the table, each time apparently less satisfied with the contents. At last he said abruptly, "Cicely, I expect a visitor to-day. Your cousin, Georgy Hume, is very ill, and is coming here for change of air."

'Cicely's heart bounded with joy at the thought of that unknown luxury—a young companion; but the next moment checked its gladness with the recollection of his being ill; and, full of sympathy, she inquired the circumstances from her father. Drawing her towards him, in grave and half-reluctant tones he proceeded to inform her that Georgy was not only ill, but very unhappy too, and that it was as much for his mind's health as for that of his body that he was sent to those who would take care of him and love him well.

'Cicely's glistening eyes had promised for her; but she quickly inquired, "What makes Georgy unhappy?" And looking up in her father's face, she added very softly, "Has he lost his own papa?"

'The eyes she was gazing at became clouded with emotion, and even a tear fell upon her cheek with the kiss that was imprinted there at once; but the answer was very different from the one she apprehended, "Oh no, my child; but he has got a new mamma!"

"A new mamma!" interrupted the little girl. "Oh, papa, is not that a happy thing? Why did you never get me a new mamma?"

'It was now the father's turn to speak impetuously; and, surprised out of his self-possession, he replied, "Because I loved you too dearly, my own heart's treasure. Nothing was ever to supply your place to me, or mine to you. Georgy's new mamma has been unkind, and his heart, they say, is breaking; and if he was not sent away, he would soon be in his grave."

'This little scene has been described to me by her

who never afterwards forgot it. It was her first introduction to the evils and sorrows of actual life; but if it opened a view down that gloomy vista, it also lighted up the past with a glow such as she had never felt before. With somewhat of awe, and a mysterious chill, she awaited the arrival of this young stranger, so early initiated into grief; and as she soothed, and comforted, and wound herself into the recesses of his heart, she learned from the artless detail of all he had suffered, to appreciate her own more favoured lot, and all the self-denying affection her own dear parent had shown. With years and acquaintance with the world, this knowledge deepened, while closer and closer she was drawn to that earliest love that had smoothed her life-long path; and it became the constant purpose of her heart to return it devotedly, and to consider no sacrifice too great, could it insure the happiness of him who had only thought of hers.

'The trial came, deeper and sooner than perhaps she had expected; but, true to her resolve, she endured it with steadfast heart. Georgy had outlived his childish griefs, or found, whenever they returned, that loving friends and a happy home still remained in the haven that had sheltered him at first. No wonder that each succeeding year increased the attraction of these friends, and that at last he became conscious there was no happiness where they were not. Alas for poor Georgy! his lot was differently cast. A relative in India had written to his father offering honourable occupation and emolument to his son if he came out; and, engrossed by the interests and advancement of his second family—influenced perhaps also by his wife, who retained all her early unkindness—Georgy's father insisted that the offer should be accepted. Family ties were easily broken; but there was one sad, sad parting, though for a time young sanguine hearts had hope that there need have been no parting at all; but when older ones were consulted, arrangements were found incompatible; and sorrowfully but determinedly Cicely relinquished a desire that for the first time brought a furrow on her father's loving brow.

'I hasten over all those scenes—indeed to me they never were enlarged on; but looking at that countenance, so gentle, yet so steadfast, we well may imagine how her constancy was tried when she thus un murmuringly sacrificed an attachment that had grown with her growth, and had woven itself from childhood into a heart such as hers. But more was yet to come. Years passed away—long, sweet, tranquil years, cheered by filial love, and perhaps by some lingering distant hope—when, in one of those commercial revolutions which from time to time have occurred in this country, involving many who seemed to have no direct connection with such events, it was discovered that Cicely's father had long before become security for a mercantile friend, a circumstance almost forgotten until his ruin brought each past transaction to light.

'Slowly it dawned upon him and on her. In fortune and prospects both were irretrievably ruined. The memories, the hopes of years, in one hour were obliterated as things that had never been: that old demeane, those trees, those walls; each revered, each familiar object all to pass away, to become the property of a stranger, and the place that had borne their name to know them no more. So much for the past; but the future—oh, how to meet that, how even contemplate the obscurity that had suddenly settled on their lives! Their sun had gone down at noon, and in the midst of life's enjoyments they were surrounded by a darkness that could be felt.

'And now shone out the constant heart. At a meeting of pitying friends, who thought at first that something might be saved, one inconsiderately remarked, "Ah, if this girl had been a son, they couldn't touch a foot of your property! What a pity you never thought of marrying again!" He to whom the speech was addressed had not time to check its thoughtless utterance, but he opened his arms to the drooping flower that

sought shelter in his bosom, as again he reiterated the declaration of his earlier life—"No son could be so precious as this daughter is to me—dearer than houses or lands, or even a time-honoured name: while she is spared, I heed them not, nor feel the blow but for her sake."

'The drooping head was raised, the bright eyes glistened, no longer tearful and sorrowing, but full of holy confidence and joy. She was all in all to her father; she filled the place of every hope, every regret; she sufficed his entire heart, and life could have no dearer reward. Then with cheerful spirit she turned again to the future, and examined her own powers, to discover in what manner she best could alleviate the privations which must be expected, without forfeiting the independence of character so precious to them both.

'They left their beloved home, and took possession of a humble dwelling. We may well believe that wounded pride found no place or entrance there; and if Cicely was sometimes pained when, with the forgetfulness of advancing years, her father would ask for some once essential comfort, she almost found a balm in the placid tone of resignation with which, remembering himself, he would say, "Ah, that was left in our old home!"

'I said that she examined her own powers: that was not the age of accomplishments; but the fewer that possessed them, the more valuable they became, and Cicely was endowed with a talent for drawing, which even now may be enjoyed by only a gifted few. She had often for amusement, or prompted by affection, taken likenesses of her friends; they had been greatly admired and prized by those who had been thus favoured; and she determined now to test the sincerity of those encomiums, and, by increased diligence and cultivation, to deserve still higher approval. She consulted and placed herself under the tuition of a distinguished artist, who had already made a name and a fortune; and he, with the generosity and noble feeling of true genius, entered warmly into her plans, afforded her his instructions, promoted and enjoyed her success, and would receive, as his only fee and reward, the privilege of transmitting her features to his canvas, as you see them represented there. For many a year he regarded that portrait as the brightest ornament of his collection; and when, in an honoured old age, he still lived to survive her, he sent this valued relic to her children, as the most precious memorial they could receive.

'It is said that ill news flies fast; and even in those days of cumbrous travelling, the tidings of their ill fortune had reached the absent Georgy in a time that seemed incredibly short, at least to those that heard from him so quickly in return. But it was to Cicely he chiefly wrote, a letter glowing with affection and generous hope, asking her to come at once and share with him the fortune he was making. Years must pass away before he could leave his employment to return; but return he yet would, and restore her to her father; or if—and this was written less confidently—her father would encounter a change of climate for the sake of witnessing their mutual happiness, what could he say, but that he would welcome him as a son, and the old man should find that he had two children with one heart.

'None can tell how Cicely felt on reading that letter: that it opened a door for happiness and short-lived hope, we well may believe. I know that she consulted the physician who had always attended her father as to the consequences of his removal to that climate; but his answer was unhesitatingly given, "It would shorten his days." Again the constant heart faltered not; but in a letter full of beauty and calm affection, she transmitted her decision to her cousin, and extinguished his long-cherished hope for ever. A few more months brought the tidings of his having made another choice; and thus ended that mutual dream.'

An involuntary exclamation from Elizabeth for a moment interrupted Mrs. Monro; and then it was in a more hurried tone she resumed—"I was the child of

that union, and when it became necessary to remove me to a European climate, the love and the home that had fostered my father's earlier years again welcomed and sheltered me. But I am anticipating by many, many years. It was with a soft and tranquil smile Cicely acquainted her father with this marriage; he seemed to think it quite a natural circumstance, and no more was ever said. Already she had attained distinction in her favourite pursuit, and with her moderate wishes, the profits it realised left her almost without a pecuniary care: thus diligent, successful, useful, and beloved, could she, even amidst these reverses, have been otherwise than happy? Oh yes, that speaking countenance always reassures me; and whenever I gaze upon it, I delight in reminding myself that at this very period of her life it was drawn.

'But another change awaited her: in time her father's health and spirits began to fail—those treasures for which she had lived and sacrificed so much; his native air and scenery were prescribed for him; and though almost wondering how, under such altered circumstances, those scenes could do him good, she submitted the proposal to his decision, and he pronounced in favour of it at once. She had commissioned a friend to seek out a quiet cottage in their old neighbourhood, when she was one day surprised by a letter from the individual who had become the proprietor of their former home. He was a very distant relation, who had purchased it partly for the name; and though they knew him not, he now addressed them in language full of delicacy and respect, saying that he was going to travel for some time, and hearing they were seeking a temporary residence in the neighbourhood, ventured to ask them, would they honour him by occupying his house while he was away?

'Cicely looked at her father: again she wondered how he would decide; but he thought his days were numbered; and though he spoke it not to her, his heart swelled with pleasure at the prospect of ending them within those old familiar walls. The offer was accepted, frankly, cordially, even as it had been made. What more need I say? Mr. Monro did not travel, at least for a while; when he did, it was only to take a little tour, with Cicely as his bride, and then return with her to cheer her father through many a happy year in his old ancestral home.

'And now, Elizabeth, will you allow that constancy and happiness are not incompatible, and that it is a virtue not to be monopolised by one exclusive sentiment?'

'Oh yes, mamma: thank you for your little story. Much as I loved dear grandmamma, I never loved her half so well as now: forgive me, sweet picture, for my heedless words. But, mamma, though I admit you have given an example of constancy under trial—constancy to a principle of mingled duty and affection—do you think that if dear grandmamma had really loved her Georgy—you know, mamma, he was your own papa—had she truly loved him as you seemed to imply, even though she might have acted as nobly in sacrificing her own wishes, could she ever have been as content and happy as she was—as full of life and animation as even I remember her—as full of serenity and peace as she there looks down upon us now? Oh, mamma! give up that point: she loved him no longer; she was inconstant to Georgy: she had learned to forget him, and he troubled not her joy.'

There was a long pause of silence, during which Elizabeth somewhat repented of her remark, for she saw that her mother's downcast eyes had filled with tears; and when she raised them to answer her again, sad, and low, and broken was the tone in which she spoke. 'Long years had passed away, and blooming children were clustering about her, when I, a pale, puny, motherless little girl, was received amidst the group. Their noisy play was hushed, and we stood a charmed circle round her, when she, recalling old memories, told of the far-off day when a similar scene was acted in that very

room; and then intreated each young, loving heart to welcome me, even as she had done that lonely stranger then.

'Other years swept on, and that stranger once more returned, enfeebled by climate, and bowed with illness, to die where he had been once restored to life. Kind and true as ever was the welcome he received, gentle the eyes that watched beside his closing day; but before that solemn hour came, he had the joy, which I can well believe was unspeakable, of seeing his child united to the son of her he truly loved.

'And she—her life prolonged to see her children's children; the true wife; the warm friend; the tender mother, guiding and gladdening all, with a countenance so bright in age, none could think a youthful sorrow ever dimmed it—she, too, at length was about to be gathered to her fathers: parents, husband, even a loved child, were in that ancient tomb before her. And yet, Elizabeth, what was her last earthly wish? "When I am dead, lay me beneath the shadowing elms in Norton churchyard, close beside the grave of Georgy Hume!"

A PEEP AT THE TARTARS.

THERE is a book before us, which we wish somebody would take the trouble of working up into half-a-dozen books.* As it is, the value of its materials is lost from their being so densely packed. You can no more read it continuously throughout, than you can read a dictionary: at least if you do, you find, as in the case of a dictionary, that one word knocks another out of your head—one scene blending with what goes before, as in a series of dissolving views, till you have only a vague feeling of amusement or delight, without being able to recall specialities more distinctly than if all had been the phantasmagoria of a dream. The breathless haste of the travellers adds to the confusion of the reader. He is not permitted to lay down the volume for a moment to meditate on some beautiful picture, or some interesting group, while the artist is refreshing after his fatigue; but hey! presto! off he is whirled on the instant, to encounter other striking pictures, and other interesting groups. Even the costume of the fair author—for Xavier Hommaire de Hell writes ride and tie with his lady—serves still further to confound the mind, by presenting to us the picture of an amazon from the saloons of Paris scouring post haste, in male attire, through the steppes of the Tartarian desert.

But this book, while reminding one irresistibly of a kaleidoscope, is not all form, glitter, and colour. It contains much that is really valuable, and conveys a very distinct idea of the tribes that inhabit the country on the west of the Caspian and the north of the Euxine. The historical sketches that intervene here and there—the production, we presume, of the male pen—enable the reader to enjoy more completely the vivid descriptions of the lady; and, taking it as a whole, the volume wants only a little more quietness and expansion, to be one of the best of the kind we have met with for a considerable time.

It may be imagined that it is no easy matter to choose a specimen from such prodigious variety; but we were so much struck with the alleged progress of the Tartars in *refinement*, that we persuaded ourselves our readers will be glad to hear something on the subject. One is surprised to be told of the *salons* of Astrakhan! but in these salons there are now European manners and fashions that transport the visitor to the *Chausée d'Antin*. The Parisian novels of the

* Travels in the Steppes of the Caspian Sea, the Crimea, the Caucasus, &c. By Xavier Hommaire de Hell. With Additions from various Sources. London: Chapman and Hall. 1847.

day are read with as much avidity, and criticised with as much acuteness, on the shores of the Caspian, as on the banks of the Seine; and the names of Lamartine, Balzac, Dumas, Eugène Sue, George Sand, &c. are even as household words on the frontiers of the Kalmucks. This, however, it will be seen, applies only to the Russians of the higher classes, who read and speak French from one end of the empire to the other, and whose ladies are frequently well-informed and intelligent women. But from Astrakhan our travellers proceeded, with all the rest of the polite world, in a *steamboat*, to visit a Kalmuck prince; and here we obtain a view of the Tartars at home, which presents something more extraordinary.

'The little island belonging to Prince Tumene stands alone in the middle of the river. From a distance, it looks like a nest of verdure resting on the waves, and waiting only a breath of wind to send it floating down the rapid course of the Volga; but as you advance, the land unfolds before you, the trees form themselves into groups, and the prince's palace displays a portion of its white façade, and the open galleries of its turrets. Every object assumes a more decided and more picturesque form, and stands out in clear relief, from the cupola of the mysterious pagoda, which you see towering above the trees, to the humble kibitka glittering in the magic tints of sunset. The landscape, as it presented itself successively to our eyes, with the unruined mirror of the Volga for its framework, wore a calm, but strange and profoundly melancholy character. It was like nothing we had ever seen before; it was a new world, which fancy might people as it pleased: one of those mysterious isles one dreams of at fifteen, after reading the "Arabian Nights;" a thing, in short, such as crosses the traveller's path but once in all his wanderings, and which we enjoyed with all the zest of unexpected pleasure. But we were soon called back from all these charming phantoms of the imagination to the realities of life: we were arrived. Our boatman moored his little craft in a clump of thorn-broom; and whilst my husband proceeded to the palace with his interpreter, I remained in the boat, divided between the pleasure I anticipated from the extraordinary things to be seen in a Kalmuck palace, and the involuntary apprehension awakened in me by all the incidents of this visit.

'The latter feeling did not last long. Not many minutes had elapsed after the departure of my companions, when I saw them returning with a young man, who was presented to me as one of the princes Tumene. It was with equal elegance and good-breeding he introduced me to the palace, where every step brought me some new surprise. I was quite unprepared for what I saw; and really, in passing through two salons, which united the most finished display of European taste with the gorgeousness of Asia, on being suddenly accosted by a young lady, who welcomed me in excellent French, I felt such a thrill of delight, that I could only answer by embracing her heartily! In this manner an acquaintance is quickly made.'

On being conducted to her chamber, the enthusiastic Frenchwoman found there a toilet apparatus in silver, with other objects both rare and precious, as well as handsome furniture. But where was the *couleur locale*? where were the characteristics of the Desert? Was this the house of a Kalmuck prince, 'a chief of those half-savage tribes that wander over the sandy plains of the Caspian Sea, a worshipper of the Grand Lama, a believer in the metempsychosis; in short, one of those beings whose existence seems to us almost fabulous, such a host of mysterious legends do their names awaken in the mind?' Prince Tumene, it seems, is the first of his nomade people who has exchanged his kibitka (or felt tent) for a European dwelling. 'The position of the palace is exquisitely chosen, and shows a sense of the beautiful as developed as that of the most

civilised nation. It is built in the Chinese style, and is prettily seated on the gentle slope of a hill about one hundred feet from the Volga. Its numerous galleries afford views over every part of the isle, and the imposing surface of the river. From one of the angles the eye looks down on a mass of foliage, through which glitter the cupola and golden ball of the pagoda. Beautiful meadows, dotted over with clumps of trees, and fields in high cultivation, unfold their carpets of verdure on the left of the palace, and form different landscapes which the eye can take in at once. The whole is enlivened by the presence of Kalmuck horsemen, camels wandering here and there through the rich pastures, and officers conveying the chief's orders from tent to tent. It is a beautiful spectacle, various in its details, and no less harmonious in its assemblage.' The scene in the kibitka, however, is more interesting, where the prince's sister-in-law still resided. 'When the curtain at the doorway of the kibitka was raised, we found ourselves in a rather spacious room, lighted from above, and hung with red damask, the reflection from which shed a glowing tint on every object; the floor was covered with a rich Turkey carpet, and the air was loaded with perfumes. In this balmy atmosphere and crimson light, we perceived the princess seated on a low platform at the farther end of the tent, dressed in glistening robes, and as motionless as an idol. Some twenty women in full dress, sitting on their heels, formed a strange and partycoloured circle round her. It was like nothing I could compare it to but an opera scene suddenly got up on the banks of the Volga. When the princess had allowed us time enough to admire her, she slowly descended the steps of the platform, approached us with dignity, took me by the hand, embraced me affectionately, and led me to the place she had just left.' The lady proved to be extremely handsome, but for the obliquity of her eyes, and the prominence of her cheek-bones; and her expression was that of the utmost gentleness and good-humour, with an air, 'like all the women of her race,' of caressing humility.

The entertainments at this visit were dancing and music; but on leaving the kibitka, a scene more wildly national presented itself. 'The moment we were perceived, five or six mounted men, armed with long lances, rushed into the middle of the *tabour* (herd of horses), keeping their eyes constantly fixed on the young prince, who was to point out the animal they should seize. The signal being given, they instantly galloped forward, and noosed a young horse with a long dishevelled mane, whose dilated eyes and smoking nostrils betokened inexpressible terror. A lightly-clad Kalmuck, who followed them on foot, immediately sprang upon the stallion, cut the thongs that were throttling him, and engaged with him in an incredible contest of daring and agility. It would be impossible, I think, for any spectacle more vividly to affect the mind than that which now met our eyes. Sometimes the rider and his horse rolled together on the grass; sometimes they shot through the air with the speed of an arrow, and then stopped abruptly, as if a wall had all at once risen up before them. On a sudden the furious animal would crawl on its belly, or rear in a manner that made us shriek with terror; then plunging forward again in his mad gallop, he would dash through the tabour, and endeavour in every possible way to shake off his novel burden.' The next exhibition of the kind was that of a child of ten years of age on a young white stallion, as wild as the other, and without saddle or bridle. 'We finished our soirée with an extemporaneous ball, that lasted all night. The Armenian, who first proposed the scheme, had to undertake the business of getting up an orchestra. I know not how he set about it, but in a few minutes he brought us triumphantly a violin, a guitar, and a flageolet. Such instruments among the Kalmucks! Is it not really prodigious? We had quickly arranged a *soirée dansante*, as complete as any drawing-room could exhibit; and

the merriment soon became so contagious, that the princess and her daughter, after much hesitation, at last overcame all bashfulness, and bravely threw themselves into a heady gallop—in which, by the by, one of them lost her cap. The wondering and delighted princess stuck to me for the rest of the night, like my shadow, and incessantly assured me, through the Armenian, that she had never in her life passed so pleasant an evening, and that she would never forget it. She expressed a strong desire to hear me sing, and found the French *romances* so much to her taste, that I had to promise I would copy out some of them for her. On her part she gave me two Kalmuck songs of her own composition, and transcribed with her own hand. According to Russian custom, the officers did full justice to the champagne, which was sent round all night at a fearful rate. They took their departure from this Kalmuck palace in their host's elegant four-in-hand equipage, lined with white satin!

From Astrakhan they pursued their way into the Desert, and this is the description of their first halt. 'The britschka, unyoked and unladen, was placed a little way from the tent, on the carpet of which were heaped portfolios, cushions, and boxes, in a manner which a painter would have thought worth notice. Whilst we were taking tea, our men were making preparations for dinner: some plucking a fine wild goose and half-a-dozen kourlis; others attending to the fire, round which were ranged two or three pots for the pilau and the bacon soup, of which the Cossacks are great admirers; and Anthony, with a little barrel of brandy under his arm, distributed the regular dram to every man with the gravity of a German major-domo. As for the officer, he lay on his back under the britschka, for sake of the shade, amusing himself with his hawk, which he had unhooded, after fastening it with a stout cord to the carriage. Though the creature's sparkling eyes were continually on the look-out for a quarry, it seemed, by the continual flapping of its wings, to enjoy its master's caresses. The camels, rejoicing in their freedom, browsed at a little distance from the tent, and contributed by their presence to give an Oriental aspect to our first essay in savage life, wherein I myself figured in my huge bonnet, dressed as usual in wide pantaloons, with a Gaulish tunic gathered round my waist by a leathern belt. By dint of wondering at everything, our wonderment at last wore itself out, and we regarded ourselves as definitively-naturalised Kalmucks.

'My first night under a tent proved to me that I was not so acclimated to the steppe as my vanity had led me to suppose. The felt cone under which I was to sleep, the Kalmucks moving about the fire, the camels sending their plaintive cries through the immensity of the Desert; in a word, everything I saw and heard, was so at variance with my habits and ways of thought, that I almost fancied I was in an opium dream.'

We must conclude our extracts with the following portrait of a Tartar princess of the Crimea and her family. 'She advanced to me with an air of remarkable dignity, took both my hands, kissed me on the two cheeks, and sat down beside me, making me many demonstrations of friendship. She wore a great deal of rouge; her eyelids were painted black, and met over the nose, giving her countenance a certain sternness, that, nevertheless, did not destroy its pleasing effect. A furred velvet vest fitted tight to her still elegant figure. Altogether, her appearance surpassed what I had conceived of her beauty. We spent a quarter of an hour closely examining each other, and interchanging, as well as we could, a few Russian words, that very insufficiently conveyed our thoughts. But in such cases looks supply the deficiencies of speech, and mine must have told the princess with what admiration I beheld her. Here, I must confess in all humility, seemed to express much more surprise than admiration at my travelling costume. What would I not have given to know the result of her purely feminine analysis of my appearance! I was even crossed in this *tête-à-tête* by a

serious scruple of conscience for having presented myself before her in male attire, which must have given her a strange notion of the fashions of Europe.

'Notwithstanding my desire to prolong my visit, in hopes of seeing her daughters, the fear of appearing intrusive prompted me to take my leave; but checking me with a very graceful gesture, she said eagerly, "*Pastoy, pastoy!*" ("Stay, stay!") and clapped her hands several times. A young girl entered at the signal, and by her mistress's orders threw open a folding-door, and immediately I was struck dumb with surprise and admiration by a most brilliant apparition. Imagine, reader, the most exquisite sultanas of whom poetry and painting have ever tried to convey an idea, and still your conception will fall far short of the enchanting models I had then before me. There were three of them, all equally beautiful and graceful. Two were clad in tunics of crimson brocade, adorned in front with broad gold lace. The tunics were open, and disclosed beneath them cashmere robes, with very tight sleeves terminating in gold fringes. The youngest wore a tunic of azure blue brocade, with silver ornaments: this was the only difference between her dress and that of her sisters. All three had magnificent black hair, escaping in countless tresses from a fez of silver filigree, set like a diadem over their ivory foreheads. They wore gold-embroidered slippers, and wide trousers drawn close at the ankle.

'I had never beheld skins so dazzlingly fair, eyelashes so long, or so delicate a bloom of youth. The calm repose that sat on the countenances of these lovely creatures had never been disturbed by any profane glance. No look but their mother's had ever told them they were beautiful; and this thought gave them an inexpressible charm in my eyes. It is not in our Europe, where women, exposed to the gaze of crowds, so soon addict themselves to coquetry, that the imagination could conceive such a type of beauty. The features of our young girls are too soon altered by the vivacity of their impressions, to allow the eye of the artist to discover in them that divine charm of purity and ignorance with which I was so struck in beholding my Tartar princesses. After embracing me, they retired to the end of the room, where they remained standing in those graceful Oriental attitudes which no woman in Europe could imitate. A dozen attendants, muffled in white muslin, were gathered round the door, gazing with respectful curiosity. Their profiles, shown in relief on a dark ground, added to the picturesque character of the scene. This delightful vision lasted an hour. When the princess saw that I was decided on going away, she signified to me by signs that I should go and see the garden; but though grateful to her for this further mark of attention, I preferred immediately rejoining my husband, being impatient to relate to him all the details of this interview, with which I was completely dazzled.'

Our author's account of the Russians and their government is far from being favourable; but we can afford room only for this brief anecdote, which would appear to contain all the principles of political economy that are fashionable in that meridian. 'I was once in the house of a Moldavian landowner of Bessarabia, whose lands bring him in about ten thousand rubles a-year. The conversation turned on agriculture. "What!" exclaimed a Russian who was present; "your estate yields you but ten thousand rubles a-year? Nonsense: put it into my hands, and I warrant you twice as much." "That would be a very agreeable thing, if it could be done," said the landlord; "I flatter myself I am tolerably well-versed in these matters, and yet I have never been able to discover any possible means of increasing my income." "How many days do your peasants work?" said the Russian. "Thirty." "That's not enough: make them work sixty. What breadth of land do they till for you?" "So much." "Double it." And so he went on through the other items of the inquiry, crying, "Double it!—double it!" We could not help heartily laughing. But the Russian remained

perfectly serious, and I am sure he thought himself as great a man as Cancrine himself. I really regret that I did not ask him, had he taken lessons in economics in the office of that illustrious financier.'

A VISIT TO THE GOVERNESSES' INSTITUTION IN LONDON.

ONE of the latest efforts of benevolence in this superlatively benevolent age, has been the establishment of an institution in London, designed to be a species of home to governesses in intervals which may occur in changing situations. Supported partly by subscriptions, and partly by payments, the institution, however, has a number of objects in view, all contributing to the comfort of this class of individuals, and which may be summed up as follows:—

1. Temporary assistance to governesses in distress, afforded privately and delicately by a committee of ladies.
2. Elective annuities to aged governesses, secured on invested capital, and independent of the prosperity of the institution.
3. Provident annuities purchased by ladies in anyway connected with education, upon government security, agreeably to the act of parliament. Money is also received for the savings' bank.
4. The home.
5. The registration.

The above are all in full operation. 6. An asylum for aged governesses, for which a house and an endowment are both required. 7. A college for governesses, and arrangements for a diploma.

Should the institution fulfil these objects, there can be no doubt of its value. Charities often, we believe, do harm as well as good, from their tendency to supersede self-reliance. We would hope, therefore, that the institution in question, if not already self-supporting, will speedily be so. Much could we expatiate on the distresses of governesses, on the false position of governesses; but all that has been said a hundred times already. A thing more desirable to speak of is the possibility of governesses helping themselves while they have the ability to do so. Where there are parents or other relatives to support, saving is of course out of the question, and for such cases the warmest sympathy is due. But it may be asked, are there not hundreds of governesses who, with salaries of from twenty-five pounds and upwards per annum, could lay aside a determinate sum yearly, either to accumulate, or as the premium of an annuity? It can be done, for we know several instances in which it is done. Nor need there be any want of places of deposit. No part of the United Kingdom is many miles distant from a savings' bank or an insurance institution. That the establishment which forms the subject of the present notice will strengthen and confirm the principle of self-reliance, we would hold to be the best part of its design. Another matter of importance is the proposed examination and certification of competency by diploma; for this will not only diminish the number of governesses, by excluding from their body all who are not duly fitted for the task they undertake, but fix in a proper basis the position of this useful class of educators.

The institution was opened in May last, and is said nearly to support itself, by the ladies who resort to it paying fifteen shillings a-week for their board and lodging—a sum, we would have feared, so large, as to confine the benefit within too narrow limits. Nevertheless, we are told that 'the facilities for re-engagements are so great, on account of the office for registration being in the same house, and the arrangements are altogether so private and comfortable, that the

'home' is in much request.' We shall now proceed to give some account of the establishment in the words of a contributor.

It was a very bright spring day, and the streets looked gay and cheerful as we drove through them. My companion (to whose benevolent exertions the institution, as I hear, is in a great measure indebted for its existence) spoke to me of many touching cases of distress in which the ladies' committee had lately rendered assistance, and of the many more in which they could give no assistance, for want of larger funds.

At length we reached the 'home'—a good house in a good street (No. 66, Harley Street). The door was opened by a respectable servant in livery (!). We wrote our names in a large book which lay open in the hall, and then proceeded into a front room on the ground-floor. It was a sort of parlour or dining-room, to which a business-like air was given by some large writing or account-books which lay open on the table. This, I was told, was the registration office. Two ladies were in this room; they were inmates of the house, and superintended the registration. To the elder of these ladies I was introduced. Her office is that of housekeeper; or, to speak correctly, she is the mistress of the family, and is a kind friend and adviser to its numerous and ever-varying members. I soon discovered that she was an educated person—clever, active, and experienced in managing a large establishment; besides having a heart full of sympathy for those who are placed around her. She showed me the registration books, and explained the plan of their arrangement. It has been found necessary to classify the numerous governesses who want situations. Some teach many, and others few things. Some have much, others little or no experience. Some are nursery, some finishing, some daily, and some resident governesses. They have been divided into classes; and books have been printed accordingly on a very clear and easy plan. By referring to these, which are open to members and visitors, any lady who is in want of a governess obtains a list of persons possessing the qualifications she may require, together with their addresses and references, and she can appoint an interview with any of them. Books are also kept for the names, addresses, and requirements of those ladies who want to engage governesses; by looking over which, ladies who wish for engagements may find one likely to suit them. Having thus put the parties *en rapport*, the institution interferes no more, but leaves them to manage as they please. The advantages of this system of registration are great to the governess. It is entirely free of expense; it saves the payment of advertisements, and of entrance and commission fees to the professed agents for procuring governess situations, of whom the less that is said will be the better for them; it saves her the trouble and annoyance (and, we may add, the not unfrequent peril) of answering advertisements; and it gives her the advantage of the large connexion of the institution. Those governesses who are residing at the 'home' have of course the best chance of re-engagements, as they are on the spot, and can see any lady who applies for a governess, at the office, immediately. On the other hand, those who need governesses find this opportunity of selection very advantageous.

After seeing the registration books, and talking over their great usefulness, Mrs —, the housekeeper, proposed to show me over the house, as the ladies were, she believed, all absent; and thus I could see how she managed to make the establishment accommodate

twenty-five boarders. She took me across an inner hall to a handsome dining-room—I observed there two harps and a piano or two. These had been presented to the ‘home’ by some friends of the institution. Music and books, and various useful and ornamental articles, have been given for the ‘home’ by friends of the institution. This room, with its bay-window, looked remarkably cheerful in the bright sunlight: so free from noise or disquietude, it seemed to me that it must be a perfect Elysium to those who come here to rest a while from the worry of the school-room. The staircase is spacious, handsome, and well-lighted. The drawing-room is a large and plainly-furnished apartment, and it felt warm and comfortable. A lady was seated by the fire reading: I feared that our entrance had disturbed her, and we did not remain for more than an instant. Thence we proceeded to the bedrooms. The largest were divided by means of curtain-screens, so as to form several independent little rooms, each fitted up with every convenience necessary for one person. The smaller rooms were divided into two, and some were so small as not to be divided at all. They did not appear to the best advantage on this occasion, as it was what in domestic phrase is called ‘cleaning day.’ They were all being scoured, or otherwise set in order; but it was easy to see the air of comfort that would pervade the whole when in its proper state. In one of the upper rooms was an invalid—a girl of seventeen—for whom Mrs — told me every one in the house was interested. She could not rise from bed, and the other inmates vied with each other in attention to her. One lady was reading to her when Mrs — knocked at the door to inquire how the patient then was. She came out to speak to us, and I was charmed to see the strong interest which she felt for her young charge, whose illness is, alas! consumption. A few weeks ago these two beings did not know of each other’s existence—each came to this house for her own convenience—and now how strong is the bond between them! The kind nurse was anxious to obtain the visits of a clergyman for her patient; and finding that the lady who had brought me to the house was the wife of a clergyman connected with the institution, she made known her wish—which has, I am sure, been complied with. This amiable woman spoke to me cheerfully of her own prospects. She ‘hoped soon to get a situation; the registration office being in the same house, was a great advantage to all those who were at the “home.” Nothing could exceed the liberality with which all things there were conducted.’ She ‘wondered how the funds could pay for all’—thought ‘that governesses could not be grateful enough to the kind people who had exerted themselves in their behalf.’ As to Mrs —, the house-keeper, ‘she was all kindness and consideration for them.’

Mrs — told me afterwards that the arrival of a new inmate often occasioned some degree of uneasiness. Governesses, after a few years of their arduous life, are often soured in temper, and are not at all disposed to see things in a bright light. They are inclined to be selfish and discontented. Is this to be wondered at, when they have been always ill-treated and neglected? ‘When they first come here,’ said Mrs —, ‘some of them are cross and unsociable, and not disposed to join in the general circle at meal-times. I do what I can to comfort and reason with them; and somehow the cheerfulness of the rest in a short time prevails over them, and at the end of a fortnight, persons of the most ungenial temper become amiable, and willing to assist in the general amusement.’ Again, she said, ‘It was sad to see how worn and weak they often were when they entered the “home,” and how, by a few weeks’ rest, and by the care of the medical attendant of the institution, they would become strong and well, and able to undertake another situation.’

The hours for meals are—breakfast at eight; luncheon at one; dinner at half-past five; and tea at eight.

After having seen and heard much that interested

me concerning this house and its inmates, I came away with a pleasing impression of the effects of *judicious co-operation*. This house nearly supports itself. Why should not governesses have such an establishment of their own in every large town in the kingdom?

THE CONTRIBUTOR.

THERE are few persons about whom the world knows so little, and inquires so little, as those who supply that portion of the stream of thought which irrigates the public mind in our countless and ever-flowing periodicals. A few names, indeed, are put forward as those of the contributors, and being usually distinguished by means of separate works, they attract some attention; but the great mass of journalists lie hidden in impenetrable anonymity, and after a busy existence, fraught in the aggregate with important social results, sink into the grave, unnoticed and unknown.

An account of contributors, could sufficient materials be obtained, would form one of the most curious and interesting chapters in literary history. It would perhaps show that to periodicals we are in a great measure indebted for the increased and increasing respectability of letters as a profession. For a long time, authors mainly depended upon private patronage, and were, in consequence, either sycophants or desperadoes; so that at length habit and circumstance came to be confounded with nature and necessity, and an inseparable union was supposed to exist between literary genius and the follies and vices of its possessors. The system of patronage gave way before the spread of knowledge. The middle classes rose gradually in intelligence and wealth, and the love of reading became more general among the people. Books were multiplied; but books alone could not meet the intellectual demand, and periodicals, therefore, were launched in all directions. Literary employment thus became more plentiful and more steady; and although authors did not all at once change their character—nor did the system, in its infancy, admit of their doing so—a revolution was commenced, which has made literature a profession for the honourable and industrious, instead of a mere refuge for the idle and dissolute.

Twenty years ago, a young man who voluntarily embraced the literary profession, or was driven by the force of circumstances to do so, was supposed by his anxious friends to have devoted himself to inevitable starvation. Before then, Sir William Jones had eloquently denounced the suicidal step; and he was followed by Coleridge, and later still by Charles Lamb, in one of his choicest bits of eccentric pathos. This was addressed as a warning to Bernard Barton; but it neither met with attention nor fulfilment. In spite of many prophetic denunciations, the ranks of contributors became at once more dense and more extensive; and although literature, at the present moment, like every other crowded profession, affords instances both of bad conduct and bad fortune, it is impossible not to see that the sweeping censure applied to it, both morally and economically, refers to a state of things that has passed away.

The common advice to follow literature as a mere recreation in the pauses of business, is doubtless a sound one when addressed to the many; and it should likewise be given to aspirants in the fine arts. But for all that, we shall still continue to have professional authors, painters, and composers, in addition to those who write, draw, or play for amusement or pocket-money. The advantage of these professions is, that they afford the novice a trial and an option. For a student of law, medicine, or divinity, there is no retracting: he must follow the business he has so painfully acquired, or sink. But the juvenile author tries his wings before he flies, and is determined by the result as to whether or not he will adventure into the fields of air. It is incorrect to say that he miscalculates or can miscalculate; for the question simply is, as to whether or not he finds his

trial-articles worth money. As for his throwing himself into the profession without a trial—proceeding to London, for instance, and taking up his pen for the first time, with the declared intention of gaining a subsistence by it—this is an absurdity that seldom or never happens. He may find himself in the wide metropolis, it is true, without friend, calling, or money; and he may apply himself to literature, or anything else, and fail; but his destitution is quite irrespective of the employment, and the profession is not to be blamed—though it constantly is—for his disappointment.

We have remarked that the public know nothing, and inquire nothing, about anonymous contributors; and in fact their total want of sympathy is a very striking feature in the case of the latter. Many a young writer flatters himself that he has produced something which will draw him from his obscurity—which will excite curiosity, or personal interest—which will at least gain for him one agreeable friend, attracted by the mystic law of congeniality. It is not enough for him that he has struck a chord which he feels will vibrate in the human heart; he would fain have sensible evidence that he has done so; and he yearns for intercommunication with spirits that resemble his own. The dream is not soon over; but at length 'charm by charm unwinds,' and he finds that it is his mission and his fate to address the general mind, not the individual; and that the voice from his lonely room is like the voice of one crying in a wilderness to the aggregate of the human race. This is doubtless a proud thought; but it has frequently the effect of giving a certain coldness and solitariness of aspect to the man, thus cut off during a very considerable portion of his time from personal communication, even in idea, with his kind.

We remember one instance, however, in which anonymous articles influenced in rather an important way the fortunes of an individual; and as the anecdote throws some light upon the condition of contributors twenty years ago, it is sufficiently germane to the subject of this paper to warrant its introduction.

Twenty years ago, the Leith and London smacks were the finest passenger vessels in the world, and as such were in great demand, as a means of transit, by travellers between Edinburgh and London. The voyage was not a very unimportant one; frequently occupying, as it did, eight or more days, and occasionally favouring the wanderer with a not very distant view of the continent. But the vessel was trim, the mariners skilful, and the fare capital; and it sometimes happened, when the company were congenial, that even in the voyage from the poorer to the wealthier country, the heaving of the lead, as the smack neared the Thames, was considered a melancholy, rather than a welcome sound. It was so on the occasion now to be noticed—at least by three individuals of the party.

Two of these were young Scotsmen, proceeding to the metropolis to push their fortune in the ranks of literature. One of them was unusually well provided for such an adventure, inasmuch as he possessed a trifling capital to begin with; that is to say, as much money as would enable him, by the aid of rigid economy, to await the turn of events for a reasonable time. His forte was the useful and practical. The other, though rich in hope, and tolerably well off in point of wardrobe, had hardly a guinea more than was required for his passage; and he depended, even for immediate subsistence, upon the fate of some manuscript articles. His genius lay in what is called light literature—poetry, romance, sentiment; and already he, as well as the other, had received some trifling sums through the post-office for contributions to the periodicals.

The young men had met for the first time on ship-board, but were soon well enough acquainted to talk of their projects and aspirations; and they had speedily one central point in common, where their eyes, thoughts, hopes, and hearts could meet. This was the third passenger, a beautiful English girl; passionately attached to literature herself, and having likewise some family connec-

tion with it; her uncle (one of the passengers) being an author of considerable distinction in science. The young lady, we need hardly say, was more struck by the beautiful than the practical; and the dealer in poetry and romance very soon obtained almost a monopoly of her attention. The other felt her neglect, but without complaining. His was a calm, steady, and astute spirit, which may be baffled for a time, but cannot be subdued. He watched his opportunity with the young lady, and returned again and again, however pointedly dismissed, till at length she listened, at first as a matter of necessity, but eventually as a matter of course.

In the meantime, however, her intimacy with the more imaginative of the two went on, till it reached a point hardly consistent, in her ignorance of his family and prospects, with feminine prudence. But we do not take into account the shortness of their acquaintance; for time, in its artificial divisions, has very little to do with the question. Had they been in the habit of meeting for years in common society, at the dinner-table or in the ball-room, they could not possibly have obtained the insight into each other's character which they now possessed, after toying together on the vasty deep for a week. They appear, in short, to have been of what is called in romance 'congenial minds;' and if there was no positive plighting of troth before they separated, this was probably owing more to the pride or delicacy of the penniless adventurer, than to the coldness or caution of the wealthy damsel. She was indeed wealthy, in the true meaning of the word; for her fortune was large enough for comfort, without being so large as to render her the mere stewardess of her friends or the public. The young man, in spite of their increasing intimacy, felt the difference in their social position more and more deeply as the voyage drew to a close; and when at length the crowding sails, stretching from all parts of the horizon to one determinate point, showed where the majestic Thames opened to receive the tributary wealth of the world, he sank into a long and moody silence. His anxiety increased as they ascended the river; but when the confusion of landing came, rendered more distracting by the darkness of a dull and heavy evening, he felt as if he was in a dream. He clasped the small pale hand that trembled in his, as if dreading to let it go; and looked so wildly, by the fitful light of a lamp, into the young lady's eyes, that she caught the infection of his foreboding fear.

'You will not lose the address?' said she faintly.

'You will come—soon?'

'Yes; if—if—'

'If what?' At that moment her arm was drawn within her uncle's, who led her away with a cold 'good evening' to his fellow-passenger.

'If a miracle happens!' replied the adventurer inwardly.

The next morning the necessity for action restored in some degree his spirits; and it was with something not unlike a flutter of vanity that he took the way to the office of a journal by which his contributions had been received with some distinction. He now learnt, for the first time, that in London a literary article, however able, is not a personal introduction. His announcement of his identity with certain initials excited no interest. The gentleman he saw was polite and affable—hoped to hear from him 'occasionally'—and bade him good morning without asking his address. Of three letters of introduction with which he was provided, two procured him a general invitation to 'call as he was passing,' and the third an invitation to dinner. He accepted the last, and liked very much the frank and agreeable manners of the family and their guests; but when he made a forenoon visit at the house soon after, he found nobody at home, and heard nothing more from his new friends for a month, when he received an engraved ticket for an evening party.

The adventurer found himself, in short, as all adventurers do at first, a hermit in London: but it was not for society he had come, but for employment—not for

amusement, but subsistence; and smothering his disappointment as well as he was able, he applied himself with energy and industry to his task. But this, it must be remembered, was twenty years ago, when journalism was only rising into a business. Articles, more frequently than otherwise, were at that time inserted through favouritism; and one editor, of a very flourishing periodical, was so indiscreet as to say, that although he liked *his* offered contributions prodigiously, he could not afford to pay for them, receiving, as he did, so many (of less merit, no doubt, but still fit enough for the purpose) without the expense of a shilling! In other cases, the prices paid were very small; and in others still, the contributor, after waiting in vain for the appearance of his articles, could obtain neither manuscript nor money. The young Scotsman worked hard, lived poorly, and at length dressed meanly; but all would not do; and in a very few months after his arrival in London, starvation stared him in the face.

The miracle had not happened! Frequently had he gone to the young lady's house; but he never entered it. Often had he haunted her steps in the street; but when she turned round, he vanished in some blind alley, like a shadow, as the poor poet said to himself with a bitter smile, exorcised by the sun.

At this period of his metropolitan history, when sitting one day in his mean apartment, brooding over the destruction of his hopes, he received the following note through the post:—

'Mr — is advised to send contributions to the — magazine, with the signature of "Frederick." They will be paid for monthly by a cheque through the post-office. If Mr — wishes to preserve this employment, he will do well to observe the strictest mystery as to the authorship of the articles.'

It was not without a flutter of the heart he read this communication; for he knew that *she* was the only human being in the whole city who felt the slightest interest in his welfare. Was it not possible—nay, certain—that this opening might have been obtained for him through the interest of her uncle? As for the injunction to mystery, this was easily enough understood, since his ill-starred name might damage, but could impart no value to what he wrote. At anyrate he resolved to comply with the instructions; and in due time he reaped the fruits of his obedience in the promised cheque.

The current of his thoughts, it may be supposed, influenced the productions of his pen; and in fact his articles may now be said to have been addressed to the young lady. He took extreme pleasure in elaborating some ideas she had herself thrown out on the voyage; and he took care, in his descriptions of natural objects, to use such language as would convince her how deeply even her lightest words had sank into his heart. Occasionally his unknown correspondent accompanied the monthly cheque with some suggestions as to the subjects that would be most successful; and it so happened that the advice always corresponded with his own feelings and wishes, tending to lead him still farther into intellectual communication with one whom he now hoped to meet again in more fortunate circumstances.

It may be imagined that his contributions to a single periodical could have no extraordinary effect upon his fortunes in themselves; but they served to give him a *point d'appui* in his struggles with the world, an anchor wherewith to steady himself in the tide. The result was soon obvious. He became more independent with other journals, and therefore more prosperous. He extended the sphere of his labours, and rendered himself competent to do so by study. Although aware that, by the aid of some rare natural gifts, even ignorance itself may obtain popularity, he had learnt that knowledge was necessary to the working literary man, and he set himself to the task of acquiring it. In due time he had reached a certain status as a general contributor; and he then began to ponder upon the prudence of throwing aside the mysterious 'Frederick.'

His own name was no longer unknown. He had reached that point where the contributor ripens into the author, and he was already engaged in negotiations which were to terminate in the production of his first book. The injunction to secrecy had reference of course only to his own interest; and by breaking it, he would merely announce that the necessity for mystery was at an end—that his own name would secure the insertion of his articles. But it was necessary, before taking any step in the matter, to make that venturous call, on which he had been hesitating for nearly a year.

It will seem to some readers not a little absurd that a serious passion should have survived so long without the sustenance even of a word or a smile. But it must be recollected that our contributor passed his life in a world of shadows. The idea of the young lady mingled with his labours as well as his dreams. He wrote not only of her, but to her; and in his small and silent study, he heard her replies as distinctly in his imagination, as if they had been whispered in his ear on that moonlit deck, cadenced by the waves of the German Ocean!

It was with a trembling hand he knocked at the door of her house, and with a fluttering heart that he found himself actually waiting in the drawing-room for her appearance. This was delayed for a considerable time; but at length Miss — entered the room. She seemed to have grown taller and fuller: there was a stateliness in her step, a pride in her eye, and a cold gravity in her whole manner, which awed and chilled him; and instead of bounding forward to meet her, which he felt inclined to do when he saw the door move, he bowed formally. An awkward silence ensued.

'May I beg to know,' said the lady at length, 'to what I am indebted for the honour of this visit?'

'I was in hopes,' replied he, in a tone of deep mortification, 'that you would have recognised the name on my card.'

'I do so. I remember you as a fellow-voyager; and I have pleasure in congratulating you on your success so far in literature.'

'It ought indeed to give you pleasure, since you are yourself the cause of my good fortune.'

'Sir!' said the lady in great surprise.

'I repeat, that it is to you I owe my capability of appearing before you as I do now, even so far as dress is concerned; but since I perceive that your kindness arose from mere charitable feeling, and that you are not inclined to accord to me the privilege of personal acquaintanceship, I shall content myself with now returning you my grateful thanks for your benevolent interference in my favour.'

'What interference? Nay, you must not go. Tell me what you mean?'

'I will tell you—and all! I was poor when I first saw you—desperately poor; but I had hope, and something more than hope—something I once dared to name in your ear! My plans, however, miscarried: I had no friends, no money, no knowledge of the world: I was ashamed to redeem the promise I had made to you to call; and by and by my dress was such as would not have been admitted by your servants. At that moment you stepped in to my rescue. You furnished me with regular literary employment; and, rising from this vantage ground, I have attained to a certain degree of independence. The mystery, however, you considered prudent is no longer necessary; and I come to resign the name of "Frederick" into your own hands.'

'Frederick!' the young lady almost shrieked. 'Surely you do not know what you say! You cannot be mean enough to assume the authorship of another's articles: but no—you are not; and without hearing another word, I know that I am lost!' He put the packet of anonymous letters into her hand; but a glance at the first was enough: she dashed them upon the ground, and throwing herself into a chair, covered her face with her hands, and wept convulsively.

So far we might go in a novel or a play; but the sequel

of this anecdote must be differently treated, as it contains nothing of the romantic, but, instead, a very remarkable instance of literary fraud.

During the voyage, the more practical of the two young men had made acquaintance with the uncle, and had afterwards called on him by invitation. His admiration of the niece was not lessened when he learned that she possessed a competent fortune at her own disposal; and being himself a gentlemanlike person in his appearance, and possessed of very fair literary talents, his acquaintance was by no means disagreeable to the young lady. He had learned, however, by his experience at sea, the key to her fancy, if not her heart, and suffered her gradually to indoctrinate him in the mysteries—mysteries to him—of poetry and sentiment. How or when the idea of arraying himself in borrowed plumes first occurred to him, is not known; but the fact is certain, that, up to the moment of his discovery, he passed as 'Frederick' not only with Miss —, but with the editor of the magazine. And this, not by downright falsehood, but rather by feint, well-managed denials (although his own name was Frederick); so that at length, in all but the eyes of the young lady herself, he withdrew from his awkward position, not only without loss of honour, but with some praise for his benevolence, in contriving, by means of his influence with the editor, to bring forward a famishing man of genius!

The extreme emotion betrayed by Miss — was caused by a feeling in which the enamourata of the voyage had very little part; for in fact arrangements had so far advanced between her and the other, that he at length threatened to expose her by bringing an action for breach of promise! The young lady, however, was firm. She would not wed the literary impostor; and the sentimental feelings of the 'Frederick' of the magazine were so much shocked by her contemplated infidelity, that he never asked her to wed him.

This, however, is the only instance we have known, in the course of a somewhat lengthened experience, of the speculations of the contributor attracting special attention to the man; and we mention the fact, in order to dispel one of the most painful and heart-wearing delusions of the literary life. The talents of a contributor, and the skill of a cabinetmaker, render parties engaged in the particular business anxious to secure their services: but there the personal interest ends. What, then, is to be said of the sympathy of the public when a successful contributor dies? That he has become a *subject* instead of a *writer*—one of the heroes, however humble, of literary history; and that the same attention is bestowed upon himself which, during his life, would have been accorded to one of his articles. It may be that his fugitive pieces are collected, and that he thus takes rank as an author; but in general, he passes away like a number of the journal on which he was engaged; the individual lost and forgotten, but his influence—great or small, harmful or injurious—left, an unavoidable legacy, to the public mind.

THE PALM FAMILY.

PALMS—keeping altogether out of view the scientific question of their organisation—are well entitled by Linnaeus 'the princes of the vegetable world,' a rank to which nature herself gives her countenance in their majesty of stature, and in the right regal crown with which she has decorated their summits. From time immemorial, the palm has been recognised by Eastern nations as an emblem of triumph, and as such was used in triumphal processions, of which a familiar example is found in the sacred text. Among ourselves, it is known only in a metaphor; and we speak of awarding the palm, without the privilege, in most cases, of a personal acquaintance with the exalted originals from which the expression sprung. In the words of the enthusiastic Von Martius, they 'hardly range beyond 35 degrees in the southern, and 40 degrees in the northern

hemisphere. The common-world atmosphere does not become these vegetable monarchs; but in those genial climes, where nature seems to have fixed her court, and summons round her of flowers, and fruits, and trees, and animated beings, a galaxy of beauty, there they tower up into the balmy air, rearing their majestic stems highest and proudest of all. Many of them at a distance, by reason of their long perpendicular shafts, have the appearance of columns, erected by the Divine Architect, bearing up the broad arch of heaven above them; pillars one hundred and fifty, and one hundred and eighty feet high, crowned with a capital of gorgeous green foliage!' The palm is thus the leading characteristic of the Eastern landscape.

Palms are commonly unisexual trees, although occasionally their flowers contain both classes of organs. By this expression is meant—and the botanical reader will pardon the explanation—that the flowers of the seed-vessel is usually found on one tree, and the flowers containing stamens on another; wherefore it is necessary that the pollen dust should be conveyed from the one to the other, otherwise the fruit will not be matured. This has been long known among the inhabitants of the East, who cultivate certain species with care and assiduity. In the spring, if one of the palm-trees with flowers containing stamens is not to be found amongst their palm plantations, they set out in the search for one, ascend the tree, and cut down its flowers; these they then carry to their plantations, and fasten a bunch of them upon the summit of the female palms, from whence the dust falls upon the flowers containing seed-vessels, and by this means the future perfection of the seed or fruit is successfully provided for. When attention to this custom is interrupted by some accident, the inevitable result is a complete failure of the crops, so to speak, for that season.

The aspect of the palm family, while there prevails a considerable 'family likeness,' is extremely various. No two trees could be apparently more opposed to one another than the curious palm the *Chamerops humilis*, with a short, squat trunk, and having the general aspect of a colossal fan, and the towering *Ceraxylon andicola*, which rears up its exalted summit to the very clouds; but the most inexpert botanist would, by a comparison, recognise the family resemblance, though compressed and flattened in the one, and surprisingly elongated in the other. The attribute of grandeur is the most prominent characteristic of this family of trees, whether taken collectively or as individuals. Some of the palms are very thin, graceful, rope-like trees: the calami and rattan palms are of this kind. The *Calamus rudentem* is sometimes four or five hundred feet in length, forming a complete vegetable cable. Rumphius says they are even from twelve to eighteen hundred feet long! These kinds of palms have occasionally curious appendages in the form of hooks, which fringe the edge of their fronds, and materially assist them in hanging themselves on to the taller inhabitants of the forests in which they are found. They abound in the Indian Archipelago. The rattan palms—held in equal estimation by fops and chimney-sweepers—delight in the densest jungles, and are found dangling in enormous lengths of stem from tree to tree, and tying together, in nooses of the most fantastic kind, even trees considerably distant from one another; their cord-like stems being also made even more graceful by the addition of a lovely foliage.

Other palms, on the contrary, are remarkable for their bulk, having stems three or four feet in diameter. The trunk of some bulges out in a curious manner in the middle, tapering off above and below. The surface of the trunk is often marked in a singular manner by spiral grooves, caused by the leaves falling off as the tree increases in age and stature. The surface of others is smooth and polished, and covered with a glittering siliceous coat; that of others presents the strange appearance of a dense clothing of bristling hairs, especially near the summit, where they are often-

times most remarkable. Then, again, in their native forests, their stately trunks will be seen completely matted over with a verdure and profusion of flowers not their own: a great orchid will in some unaccountable manner get a firm seat upon their summit, and thence drop down its outlandish roots, and leaves, and marvellous flowers in rich profusion; or some of the wild-wood creepers will clasp round them, and, as it were, tie them on all sides to the earth, somewhat like the cordage of a ship's mast; while occasionally man himself makes the same use of them, and trains up their stems the plants which he has pressed into his own service: the common black pepper plant is thus trained up the trunk of the palm known as the *Areca catechu*.

The foliage of these noble trees is one of their most wonderful characteristics; it is on so gigantic a scale. Ten, fifteen, or twenty feet is by no means an uncommon length for some of the leaves to attain to. Those of the talipat palm, which is found abundantly in the island of Ceylon, are frequently upwards of eleven feet long, and sixteen broad, and have been used to cover the entire freight and crew of a small boat, fifteen or twenty men finding a complete shelter under this colossal leaf. Others of smaller dimensions are used as *punkhas*. Their shape is exceedingly remarkable. Some are sword-like, and jut out on every side of the palm like a palisade of long spikes; others resemble large fans; and others are fringed like an ostrich feather, but on an immense scale. It is this enormous foliage which contributes so much grandeur to this family of trees.

The effect upon the mind of the great traveller before mentioned was such, that he despaired of finding words to convey it, although every now and then breaking out into strains of the most eloquent admiration. Along the banks of the Orinoco, the palms are found in the most picturesque spots, growing upon the granite rocks over which the river rolls in some parts of its course, or adorning the vast plains through which it drags its way. At certain seasons, Humboldt has seen these vast plains flooded, and has been astonished to observe fire and smoke issuing from the summit of a tall palm surrounded by the swollen waters. He found that the Guanacas are in the habit at these seasons of taking up their dwelling in the summit of the palm known as the *Mauritia flexuosa*; they prepare a kind of fireplace by means of mats, lined with a thick coating of clay, and here they kindle fires for cooking their food and other purposes. Though less imposing, the date plantations are described as forming very beautiful scenes; their summits perpetually fresh and green, and upheld in a majestic succession of colonnades, they have been happily compared to a temple of nature, representing an eternal spring. Under the refreshing shade of these palms grow in astonishing luxuriance the pomegranate, orange, lemon, olive, almond, and vine, producing the most delicious fruit, in a perfection which, considering the amount of shade in which they grow, could scarcely have been predicted.

As to the economical properties of the palms, nature seems to have condensed in one family the gifts she has more sparingly bestowed upon many others. The sugar of the cane, the wine of the grape, the flour of the cereals, the oil of the olive, the wax of the bee, and the salt of the earth—six of the most valuable articles for the support of human existence—have met together to enrich the palm family with their presence. In attempting to give a short account of the properties and products of the palms, it will be expedient to arrange them under two divisions: the first comprising such as are directly useful to man, as for his sustenance, &c.; and the second, such as are more indirectly serviceable to him, as weapons, &c.

Under the guidance of this rule, let us first commence with the article sugar. Sugar is yielded by many species of palms, such as the invaluable cocoa-nut, the *Arenga saccharifera*, and *Phoenix sylvestris*. Incisions

are made into the trunk and other parts of the tree, from which the sap exudes in abundance, and is collected into vessels. It is then boiled down, and forms a kind of sugar, said to be very good in its way, known as date-sugar or 'jagery.' Though not so much esteemed as the production of the sugar-cane, it is, nevertheless, exported into England in large quantities from Bengal. Some years ago, it was calculated by Dr Roxburgh that 100,000 hundredweight of such sugar was annually made in Bengal from the juice of one species of palm only. Each tree yields annually from one hundred and twenty to two hundred and forty pints of the juice, which, on an average, makes about seven or eight pounds of good sugar. The inhabitants of the Indian Archipelago derive the principal part of their sugar from the evaporated juice of the *Arenga saccharifera*, a small palm, replete with valuable properties. The jagery, while still warm and semifluid, is poured into coconut shells, and left to cool, when it forms a solid mass, and in this state is used by the natives. Singularly enough, jagery itself seems to partake of the universally useful character of the trees from which it is procured. When mixed with lime, it forms a cement, which resists moisture and solar heat, and is employed by the natives of Ceylon as we use stucco. In this condition it is employed for flooring, and coating of columns; and as it is capable of a fine polish, for imitating marble.

Palm wine, better known under the more familiar title of 'toddy,' is a second important produce of this family. It is simply the sweet juice which flows from the wounded trees, allowed to stand a little while and ferment, when it becomes highly intoxicating. The extraction of this wine is performed by regular professional operators, under the title of 'toddy-drawers.' Their implements are a broad knife and the shell of a large gourd; but the ascension of a tree fifty or sixty feet in height, is an undertaking not to be accomplished without some risk and difficulty. The toddy-drawer proceeds in this way: he procures the stem of some creeping plant of sufficient strength and pliability, with which he forms a kind of hoop around the trunk; into this he thrusts both his feet, and then by alternately using his hands and feet in a peculiar manner, he reaches the top of the tree without much difficulty or fatigue. When there, he phlebotomises his vegetable patient in a very scientific manner. The stump of the flower-sheath is firmly tied round with a ligature, and the point is cut off. It is then beaten soundly with a stick, and very soon the liquid begins to exude in abundance, being received into an earthen vessel suspended beneath the bleeding surface. A good tree, in a favourable soil and season, will yield daily from three to four pints for each blossom; but the *Carzota urens* has been said to yield, during the hot season, the amazing quantity of one hundred pints of toddy in twenty-four hours, or a little more than a pint every quarter of an hour! The same juice, when distilled, yields the fiery spirit well known as *arrack*, the ruin of the European soldier in India. When fresh, it forms a cool and inexpressibly grateful beverage to him who, as Darwin says, can sit beneath the broad shadow of the palm, and quench his thirst with its delightful produce. The palms yielding toddy are cultivated also in clumps, known as 'toddy-topes.' And the toddy is here collected in a peculiar manner. The palms are all connected by ropes, tied to their summits, and hauled tight. The toddy-drawer then ascends a tree about the centre of these, and proceeds from one to the other by means of the connecting ropes, collecting the exuded juice, and lowering his vessel down, when filled, to an assistant below.

Sago forms a third valuable article afforded by the palm, of which about 36,000 hundredweight finds its way into England every year. It is produced in wonderful quantities by many species of palms, individual trees of some kinds yielding between six and seven hundred pounds of sago. It not unfrequently happens, that when the unhappy palm has been drained of its

life-juice, it is cut down, and from its pith and the softer portions of the trunk, when pounded in water, several hundred pounds of sago are extracted. The finest sago comes principally from the Moluccas, where it is procured from a palm which grows in vast forests. This substance forms frequently the sole support of the natives, and is at all times a most essential portion of their diet; its dietetic value among ourselves need not be dwelt upon.

In the year 1841, the enormous quantity of 168,528 hundredweight of palm-oil was imported into this country, and the consumption is probably considerably greater at the present moment. It is obtained from a species of palm called the *Elais*. This substance is extensively employed in the manufacture of candles, which, however, have a disagreeable colour, though the light is pure and bright. It enters also largely into the composition of some kinds of soap, and is used in immense quantities as a lubricant for machinery. Cocoa-nut oil is, strictly speaking, a palm-oil also; but it presents several distinct features from the substance known under that name. It is obtained principally by expressing the soft part of the nut, and is coming into extensive use for the table-lamp. What a remarkable sight the wax palm mentioned by Humboldt and Martius must be, its trunk all covered over with a layer of wax exuded from the surface of the trunk, and in some cases thrown off in great scales by the leaves! Of a different kind of use is the great 'cabbage palm,' the *Oreodoxa oleracea*, according to Dr Royle. The large green top of the trunk of this palm is eaten, both raw and cooked, in the West Indies, where it is considered a great delicacy, an expression which is doubly correct. The unexpanded terminal bud of the cocoa palm is also a very choice article of food; but it has been stated that the trees die if it is removed. The *Mauritia Vinifera*, a gorgeous palm, sometimes a hundred and thirty feet high, besides yielding ropes, and oars, and a pleasant acidulous wine, contains within its fruit a pulpy mass, which, when prepared with sugar, forms a sort of preserve named 'sajetta,' so highly esteemed, as to sell for one hundred and sixty reals the pound. Martius mentions the curious circumstance, that a certain number of these noble palms forms the marriage portion of a bride, among the nations where the tree grows, and is by no means a despicable dowry.

The cocoa-nut, however, is the palm of palms, and has been well selected as a type of the useful endowments of the family. That learned traveller was right who said, it seemed as if nature had epitomised in the cocoa-nut the whole of the invaluable properties she had diffused among the family of palm-trees. The cocoa palm seldom fruits to any abundance before its eighth or tenth year, when it enters upon its career of unexampled usefulness to man. It yields fruit for sixty, seventy, or even one hundred years, producing from eighty to one hundred nuts annually. In good soils this wonderful tree will blossom every four or five weeks, and may be found almost perpetually adorned with flowers and fruit, and sometimes with both at once. The natives say the cocoa-nut is a tree delighting in the society of man; and it is certain it thrives best near his dwellings, since it is the custom of the people to deposit the refuse of their huts at the foot of the tree. The nuts, writes Mr Marshall in an elaborate paper upon this palm, are brought hither as wedges to fill in the interstices between the merchandises of our vessels: thus the freight costs nothing. Our supply is principally from the West Indies. A few years ago, it was estimated that six hundred thousand cocoa-nuts were thus annually imported into England, and this number must be greatly increased now. From the kernel of the cocoa-nut a pleasant kind of cake is prepared, which is a good substitute for bread. Puddings are also made of it; and with its milk, and the grated kernel, the incomparable Indian dish, curry, is prepared. Besides the value of the cocoa-nut as an article of diet, there is a kind known as the Maldivé cocoa-nut, the fruit of a

palm growing in the Isle of Palma, one of the Sychelle islands, which used to be valued at L.400 each, on account of its supposed medicinal virtues.

The fruit next in importance to the cocoa-nut is the date. The palm which yields it is the *Phoenix dactylifera*: it is cultivated very extensively along the edge of the great African and Arabian deserts; in one portion of this region to such an extent as to have conferred upon it the title of Bilduljerid, 'The Land of Dates.' The date-tree is the palm of the Scriptures: it was the emblem of Judæa, and will be remembered by the reader to have been figured as such in the well-known coin representing 'Judæa capta.' The date forms the principal support of the inhabitants of Arabia, Egypt, and the northern parts of Africa; with us, it is a luxury found chiefly upon the tables of the wealthier classes. This important tree grows slowly, but is said to live and bear fruit from two to three hundred years. The fruit grows in clusters, weighing from twenty to thirty pounds each, and is collected by the date-gatherer, who ascends the trees somewhat in the same manner as the toddy-drawer. From the value of the fruit, the culture of the date has received much attention; and the date plantations, whose majestic aspect has been mentioned, are carefully tended, and watered by artificial means. About one thousand hundredweight of dates is said to be imported into England, principally from Barbary. The Taflat date is also much esteemed amongst us. The fruit, after being well baked in the sun, and dried, is made into a kind of flour, which frequently forms the entire sustenance of the caravans of the Desert, and will keep for a length of time if preserved from damp. Besides the fruit, the peduncle of the flowers is eaten, and with great avidity, especially by children. The traveller in the south of France will find that the date palm has wandered even there, and is cultivated not for its fruit, but for the leaves, which are sold for the celebration of Palm Sunday, at six or seven sous a leaf.

The wood of palm-trees is in many countries used for building purposes, and is said to possess a durability, and to offer a resistance to insects and weather, which that of no other trees can boast of. There are at this moment old houses constructed with it, which are in every respect almost as sound now as on the first day of their erection. The outer layers of the trunk of some species are so hard, as to have been used instead of iron for weapons, and drums are made from sections of the trunk. Mr Marshall says he has seen pieces of palm-wood so dense and hard as to resemble agate, and they have been cut and polished, and set as brooches. Cooking vessels, capable of containing several pints of water, and of enduring a considerable degree of heat, are made out of the spathe of other palms, and are extensively employed by the Caribbee islanders for evaporating salt water, and obtaining its saline ingredients. The great leaves of the palm-trees form an admirable thatch for houses, and frequently large temporary buildings are constructed in India with no other materials. By soaking the leaves in water, a fibrous material is extracted, which is made into cloths, carpets, &c. Baskets and buckets, close enough to hold water, are also made out of the leaves. The young leaves are formed into beautiful lanterns. The leaves are also a tolerable substitute for paper, the writing being executed with an iron style. They require a peculiar preparation for this purpose, and are then called *ollars*. The woody ribs of the leaflets are used as brooms, pins, toothpicks, and torches. Other portions of the leaves form pens, and the sharp arrows which are blown from tubes by the Indians. Bristles of different kinds, used as needles, and as a substitute for hair in brooms, are derived from the leaf-stalks, and the midrib forms a capital oar. The substance known as coir, and now imported in large quantities into our country, is derived principally from the fibrous husk which envelopes the cocoa-nut. When this has been macerated in sea water, it is teased out, and then is

manufactured into an admirable kind of cordage and cable, very elastic, durable, and strong. Soaking in sea water is even said to improve them! The same material is largely employed as a stuffing for mattresses, being as elastic as hair, and less friendly to the presence of vermin. It is also woven into different kinds of matting for lobbies and churches, which are surprisingly durable, resisting for a length of time the effects of the very hardest wear. The trunk of many palms is made into boats, the leaf supplying the oar. Fans and punkhas are constructed out of the leaves. The stems of others are used to make bows; and the rattan, so well known among us, has been mentioned as derived from a palm of Brazil. The baskets and sacks in which the Java coffee is imported, are made from the leaves of a palm, which also affords material for hats, fishing-nets, shirts, and ropes. The wood is sometimes singularly marked and veined, and is hence largely used by our cabinetmakers for marquetry-work, and inlaying generally. Our toy-warehouses have been inundated lately with a variety of toys manufactured out of the substance called 'vegetable ivory,' stated by Humboldt to be the produce of a tree growing upon the banks of the river Magdalena, and resembling a cocoa-nut palm. Dr Lindley quotes the following particulars about it from some Spanish botanists:—'The Indians cover their cottages with the leaves of this most beautiful palm. The fruit at first contains a clear insipid fluid, by which travellers allay their thirst; afterwards this same liquor becomes milky and sweet, and it changes its taste by degrees as it acquires solidity, till at last it is almost as hard as ivory. The liquor contained in the young fruits becomes acid, if they are cut from the trees, and kept some time. From the kernels the Indians fashion the knobs of walking-sticks, the reels of spindles, and little toys, which are whiter than ivory, and as hard, if they are not put under water; and if they are, they become white and hard again when dried. Bears devour the young fruit with avidity.' The comparatively small size of these kernels precludes the possibility of using them for many purposes to which ivory is applied, but within the sphere of their dimensions they promise to play a useful subsidiary part. Even in their very destruction the palm-trees are our benefactors, for their ashes furnish the washermen of Ceylon with sufficient potash to enable them to dispense with soap.

Enough, in our opinion, has now been said to place the palm family in its proper position. The question concerning them is not, What do they afford us? But what is there that they do not? Utilitarians to the very last, it might be said of them, that were there now no other vegetation in the world but a universal palm family, mankind would hardly have any cause for regret.

EFFECTS OF MACHINERY.

Notwithstanding the manufacturing power of our country, there is scarcely any manufactured commodity which is not produced by some other realm of a superior quality, excepting heavy machinery and cutlery. The carpets of Persia are yet unrivalled—one lately imported was thought worthy to be made the cover of the privy-council table when royalty presided. The cashmeres of India are not yet equalled by the looms of France or Scotland. The leathers of Morocco and Russia are superior to our own. The finest cloth of Saxony has yet to be equalled in colour and durability by the clothiers of our country. The silks of China and France in colour and quality of material are found to wear better. The damasks of the continent, and the broad cloth of Holland, bear a higher price, and are more esteemed than our corresponding manufactures of Ireland and Paisley. Yet England produces all those and many more commodities at so cheap a rate, that she sells her inferior commodities to the nations of the world at a price so much less than similar and superior commodities can be produced by themselves, that they find it more profitable to purchase the commodities manufactured by us from their raw materials, than to use their

own. Thus a considerable portion of the muslin worn by the inhabitants of British India is manufactured in Scotland.—*British and Foreign Review.*

THE CRY OF THE EARTH.

'Weep on—weep on, ye April skies!'
Cries mother Earth in glee;
'Like drops from pitying angels' eyes
Their freshness falls on me.
Oh let the genial dews of spring
Be on my bosom shed!
To bring rich Plenty following
Gaunt Famine's iron tread.
Day after day in pain subdued
I hear my children moan,
'We faint—we die for lack of food!'
And I can give them none.
Fall soft, fall fast, ye welcome rains,
Upon the thirsty ground;
And be my dry and barren plains
With golden harvests crowned,
Till far and wide, from strand to strand,
The valleys laugh and sing,
And o'er a rich and plenteous land
Glad, grateful voices ring.'

D. M. M.

CRIMINALITY OF SINGING IN GREECE.

It must be observed that no woman of the island ever sings; and the Sfakian women, whose seclusion and reserve is greater than that of the other female Cretans, never even dance, except on some great religious festivals, and then only with very near relations. Maniás, who thinks that the readiness with which the women of Mylopótamo and other parts of the island join in the dance is hardly creditable to them, was greatly horrified at the idea of any respectable female ever singing; and assured me that it was quite impossible for a Greek woman to disgrace herself by doing anything so disreputable.—*Pashley's Travels in Crete.*

THEORY OF HUMAN ACTION.

Every human action has three aspects: its *moral aspect*, or that of its *right and wrong*; its *aesthetic aspect*, or that of its *beauty*; its *sympathetic aspect*, or that of its *loveableness*. The first addresses itself to our reason and conscience; the second to our imagination; the third to our human fellow-feeling. According to the first, we approve or disapprove; according to the second, we admire or despise; according to the third, we love, pity, or dislike. The *morality* of an action depends upon its foreseeable consequences; its beauty and its loveableness, or the reverse, depend upon the qualities which it is evidence of. Thus, a lie is *wrong*, because its effect is to mislead, and because it tends to destroy the confidence of man in man: it is also *mean*, because it is cowardly; because it proceeds from not daring to face the consequences of telling the truth; or, at best, is evidence of that want of power to compass our ends by straightforward means, which is conceived as properly belonging to every person not deficient in energy or in understanding. The action of Brutus in sentencing his sons was *right*, because it was executing a law essential to the freedom of his country against persons of whose guilt there was no doubt: it was *admirable*, because it evinced a rare degree of patriotism, courage, and self-control: but there was nothing *loveable* in it; it affords no presumption in regard to loveable qualities, unless a presumption of their deficiency. If one of the sons had engaged in the conspiracy from affection for the other, his action would have been loveable, though neither moral nor admirable. It is not possible for any sophistry to confound these three modes of viewing an action, but it is very possible to adhere to one of them exclusively, and lose sight of the rest. Sentimentality consists in setting the last two of the three above the first; the error of moralists, in general, is to sink the two latter entirely.—*Mill's Estimate of Bentham's Philosophy.*

A RALLY FOR THE MANY-CHILDED.

WE have received the following communication from our friend and cousin Mr John Balderstone—a gentleman formerly introduced to our readers, in a paper entitled *The House of Numbers* :—

'I wish you could make an effort in your journal in behalf of the many-childed. It cannot fail to have occurred to your observant mind that there is a disposition to look upon large families as a kind of misfortune to their parents, without, however, any inclination to pity it as such, but rather a tendency to treat it as a matter of mirth. To me, as one of the sufferers, this appears, to say the very least, too bad. For society both to accept of the new members brought up at so much expense, and to laugh at those who bear that expense, is surely "most tolerable, and not to be endured." Yet this has been the mood of the public mind for many years past.

'It did not use to be so. There was a time when men in general felt much like worthy Dr Primrose—that he who married and reared a large family was a more deserving person than he who remained single, and only talked of population. Unluckily, those who talk of population got the upper hand about fifty years ago, and have ever since maintained it. I don't know if their talk has done much to keep down the numbers of mankind; but certainly they have succeeded in raising a sort of odium on the subject. It is too bad. For only see how the case really stands, as between the many-childed and the world.

'The farmer requires a constant supply of fresh hands to carry on the work of his farm. He takes no care, incurs no expense, on this account. Those who now serve him have the whole charge upon themselves of rearing, out of their narrow incomes, the sturdy swains who are to drive plough and harrows after them. The poor mother has suffered and toiled, the father has been held in poverty, that the work of the world might not slacken when their sinews are no longer tensible.

'Genteel families require maid-servants. Whence do maid-servants come? Not one penny have they cost the middle classes. They have been entirely reared at the expense of the poor. Monuments are they of hardship and privation of all kinds, which humble parents have endured, that ladies and gentlemen might be served.

'The manufactures by which our country gains so much wealth, and keeps so high a place among nations, can only be carried on by means of endless relays of hardy artisans. Whence comes this so needful enginery? It is not bought, as machines are, by the money of the masters. No; it comes, without purchase or price, wholly from the humble homes of the poor fellows who have already given their own strength to the world's

work. Each new hand represents at least a dozen years' board, lodging, care and nurture of all kinds, which have been furnished solely, or perhaps all but solely, out of the limited gains of parents. Sometimes a little is repaid to the expeditors by the work of the new hand during a few of his juvenile years; but seldom does this go far to serve as a remuneration, and in no case is it certainly to be depended on. Justly regarded, the duty which the parent pays to his child, though only what nature demands, and not to be neglected without the most shameful guilt, is not fulfilled without becoming an obligation on society, and a claim upon public gratitude and respect, rather than a subject for its ridicule.

'Look again at the middle classes. The public requires young men to fill shops, counting-rooms, the army, the bar, the pulpit, and so forth. Were these wanting, society would become disorganised. It must have them: it gets them too; but it never pays anything for them. As a general case, the youth have been reared for these situations solely at the expense of their parents, though, as far as social objects are concerned, parents have no more interest in seeing the situations filled than bachelors have, who contribute no benefit of the kind to the public, and are never expected to spend a penny in the nurture of their neighbours' children. Burns thought it the most piteous of all things to see a man asking his brother worm for "leave to toil." Is it not a peculiarly piteous phase of this picture to see a mother, in respectable but not affluent circumstances, going about with a stout raw-boned scion of her house, for whom she is anxious to obtain a situation? God only knows what she has suffered and done for this babe before he came to his present steeple-like height; but just think for a moment of the troubles she has had in seeing him through the horrid series of children's diseases—her cares in getting him to avoid lying, and prepare his lessons for school—the stockings and other gear she has mended for him—the frights she has got about his falls, his drownings, his batteries, his scrapes of all imaginable kinds—with all this, a continual fight with poverty, in consequence of having him and others to feed and clothe out of a narrow income; and then think of what it is she is looking for or claiming in behalf of her progeny—nothing but that he may be allowed to take his place in the Great Loom, to give the world the toil which it needs, and get but his mouthful in return; and it must appear as just about the greatest hardship in the world, that the poor woman should have to consider herself as the obliged party, if the world takes her son in any degree off her hands. Why, instead of being the obliged party, it seems to me that the world stands indebted to the woman for the whole cost of her son, anxieties and stocking-darnings included. She is one who has deserved well of the republic; and if any gross reward could

reward her, such a reward ought to be hers. She is at the least entitled to such an acknowledgment from the community as kings have been known to pay to those who furnished forth a fully-accounted warrior for their service. A flourish of gallant compliments and thanks ought to be rendered to her.

View also the case of marriageable daughters. There is nothing which has excited more merriment in our literature for many years, than the real or supposed manoeuvres of mothers to get their girls disposed of. It seems now to be a settled matter, that the parents of unmarried young ladies must feel them as a dreadful burden, and must therefore be ever eager to get them cantoned out in the houses of their bachelor acquaintance. Now, perhaps some persons of no very exalted feelings, and, I may add, no very profound wisdom, have used expedients to obtain matches for their daughters; but not less certain is it that others shrink from everything of the kind. I protest against the whole strain of mind which we find in the merry world on this point. It is founded on injustice, and tends to de-grade human nature. I claim a wholly different kind of consideration for an honest couple who have reared daughters in a fitting manner to encounter, if God wills, the responsibilities of matrimony. Here, as before, I take my stand on this—that the young persons are required by society, and the trouble and expense of presenting them is incurred by the parents alone. To take a particular case. A man wishes to have a wife. It is a presumable advantage to him, or he would not wish for it: it is a presumable benefit to society, or society would not be so eager to sanction matrimony. He gets the wife from her parents, with probably a trousseau and a square pianoforte into the bargain. Sink these externals, and think of what the young lady represents, altogether over and above what she is. How much must she have cost to her parents in feeding, clothing, and educating, before she became the bewitching, accomplished creature which her papa has to give away at the altar! Do we not, in reality, see here one man obtaining from another, as a free gift, one of the most valuable things which exist in the world—a favour almost too great to be reasonably taken by one man from another? I hold that nothing prevents it from being regarded in this light but the spirit of civilisation. In primitive society, where a wife represents work or service, the savage father sees it as only reasonable that he should be reimbursed for his outlay upon his daughter; he therefore sells her to her lover for articles of exchangeable value, as horses or bullocks. We do not act in this manner, because, being advanced in social humanity, we are content that the favour should be handed down from one generation to another—the obliged lover of to-day being the obliging father of twenty years hence. But surely, when the father or mother of many daughters is acting in this spirit, it is but a coarse and uncivilised kind of jocularly which represents them in the mean and unworthy light of manoeuvrers for the settlement of their daughters. In sustaining the young ladies up to this point, and fitting them out as moral and enlightened beings, they have undoubtedly performed a duty towards society as well as towards their offspring; and when they render up these young creatures to other keeping, they clearly are the obliging, and not in any way the obliged parties. Why, then, should there be any feeling of a derogatory nature indulged in respecting them? Are they not rather entitled to some degree of honour above their fellows?

There is no rank or class of society respecting which it could not equally be shown that the rearer of the large family is a kind of creditor to the community. Everywhere it is useful to have fresh human beings rising up; everywhere is the duty of bringing them up partially borne. To put the matter into its grossest

and most palpable form: of two men of equal income and grade, the one with a family, and the other not, the former must be a poor man in comparison. And yet society at large is benefited by what renders him poor. Ergo, society is his debtor. It owes him sympathy, if not money. And surely it is no small presumption in favour of this view, that children obtained veneration for their parents in all ages and states of society but our own. Does it not imply something wrong in the spirit of our age, or in its actual circumstances, that it should witness the reversal of a feeling which had previously seemed the dictate of nature from the beginning of the world? What is the matter? It certainly is not that the world, being over-peopled, looks on the fresh family as a set of unwelcome intruders; for, after all, Dr Malthus's fears have proved visionary, and men in general never entertained them with any earnestness. It seems to me rather that we look on things now somewhat less in connection with the primitive domestic feelings than formerly. We regard the numerous family too exclusively as affecting the mere worldly circumstances of their parents, and slight the many-childed house for the same reason that poverty has been slighted throughout all ages. Base idea! To look on those young vessels of the human soul as only so much trouble or embarrassment. Perish such mean considerations—as perish everything that can lead to low views of human nature, that brightest effluence of Divinity here below! On this point society could not do better, as it appears to me, than look for a lesson to those who have the immediate care of the young at the earliest and most painful stage. Beautiful patience!—adorable tenderness!—hopes that wing ever on and on into a delightful future! How the cold disdain of the childless is put to shame by this mother feeling, even when exemplified where there is not conscious maternity to give it its last and truest intensity! No sense of poverty is here entertained, but rather the contrary, as if the lap where lies the breathing babe were filled with opulence unspeakable. Let society look on the young as its best and truest wealth, which nature says they are, and the many-childed will take their true position as the monied men of the state.

Bravo, our good cousin! You plead your own cause too well to need any backing.

LIFE IN THE PACIFIC.

SOME time ago the public were amused by a work called 'Typee,' purporting to be the real adventures of an American in the Marquesas islands in the South Sea. There was a certain originality about the book, both in its manner and matter, which was very captivating in the present state of our literature; and besides this, the things in the narrative were evidently true, whatever might be said of the persons; so it is no wonder that the author has been encouraged to make a second appearance. The new work is called 'Omoo' (The Rover, or Island-Wanderer);* and without any farther connection with its predecessor, continues the autobiography from the escape of the adventurer from Typee.

The narrative opens with his being taken on board of a whaler about a league from the land, 'the only object that broke the broad expanse of the ocean.' Here he gladly ships as one of the crew, for a single cruise, and regales with infinite delight, after his vegetable diet in the Marquesas valley, on salt junk and its platter of hard biscuit.

The vessel was a beautiful, but very elderly barque of 200 tons, and had already been condemned while serving as an English government-packet in the Australian seas. She was rotten to the core; with a fore-castle

* Omoo: or Adventures in the South Sea. Murray's Home and Colonial Library. London. 1847.

(the lodging of the crew) that looked like the hollow of an old tree going to decay, from the walls of which slices were taken unceremoniously by the cook to kindle his fire, and by the others out of mere frolic. The principal personages on board were the captain; a slender young Cockney, whose soubriquets of 'Cabin-boy' and 'Paper Jack' designate his character, and the estimation in which he was held; the mate, a regular old sea-dog—short, thickset, and pockpitted, his hair curled in little rings of iron-gray round his bullet head, a fiercely-squinting eye, a twisted nose, and a large mouth, set off by great white sharkish-looking teeth; the ex-surgeon, called the Long Doctor, or Doctor Long Ghost, who, in consequence of a quarrel with the captain, had given in his resignation, and taken up his abode in the fore-castle; and a harpooner, a wild New Zealander—a dark moody savage, who, in the sequel, endeavoured to run the ship on the reefs, in order to drown himself and everybody else. With these materials, it may be supposed, our author contrives to divest the voyage of anything like tameness; and indeed we have some idea that the portion of the narrative in which he is afloat will be found more interesting than that in which he assumes the character of an *omoo*, or wanderer among the Society Islands. The worst of it is, however, that, in order to preserve its character of reality, the narrative parts with its best personages without the least ceremony. For our part we longed to know what became of this strange crew when they sailed away from Tahiti; and we do not care to hide our discontent at having palmed upon us, as substitutes for the whole batch, merely Doctor Long Ghost and the author.

The fore-castle—the parlour and bedroom of the men—was a triangular apartment in the extreme bows of the ship, five feet high, and floored with the chests of the crew, over which it was necessary to crawl, walking or standing being out of the question. The provisions dispensed here were not much more inviting than the parlour. 'When opened, the barrels of pork looked as if preserved in iron rust, and diffused an odour like a stale ragout. The beef was worse yet; a mahogany-coloured fibrous substance, so tough and tasteless, that I almost believed the cook's story of a horse's hoof with the shoe on having been fished up out of the pickle of one of the casks. Nor was the biscuit much better; nearly all of it was broken into hard little gun-flints, honeycombed through and through, as if the worms usually infesting this article in long tropical voyages had, in boring after nutriment, come out at the antipodes without finding anything.' These delicate viands had been bought at an auction of condemned navy stores in Sydney. The lodgings, as well as the fare, were so successfully disputed with the crew by myriads of cockroaches and regiments of rats, that 'they did not live among you, but you among them;' and 'so true was this, that the business of eating and drinking was better done in the dark than in the light of day.' All this, however, was taken very easily, and the sailors passed their leisure time in such good-humoured jokes as fastening a rope to the leg of a sleeper, and running him suddenly up to the yard-arm by means of a pulley. On one occasion the object was frustrated in a manner both amusing and consonant with poetical justice.

'One night, when all was perfectly still, I lay awake in the fore-castle; the lamp was burning low and thick, and swinging from its blackened beam; and with the uniform motion of the ship, the men in the bunks rolled slowly from side to side, the hammocks swaying in unison.

'Presently I heard a foot upon the ladder, and looking up, saw a wide trousers leg. Immediately Navy Bob, a stout old Triton, stealthily descended, and at once went to groping in the locker after something to eat.

'Supper ended, he proceeded to load his pipe. Now, for a good comfortable smoke at sea, there never was a better place than the Julia's fore-castle at midnight. To enjoy the luxury, one wants to fall into a kind of dreamy

reverie, only known to the children of the weed. And the very atmosphere of the place, laden as it was with the snores of the sleepers, was inducive of this. No wonder, then, that after a while Bob's head sunk upon his breast; presently his hat fell off, the extinguished pipe dropped from his mouth, and the next moment he lay out on the chest as tranquil as an infant.

'Suddenly an order was heard on deck, followed by the trampling of feet and the hauling of rigging. The yards were being braced; and soon after the sleeper was missed, for there was a whispered conference over the scuttle.

'Directly a shadow glided across the fore-castle, and noiselessly approached the unsuspecting Bob. It was one of the watch with the end of a rope leading out of sight up the scuttle. Pausing an instant, the sailor pressed softly the chest of his victim, sounding his slumbers; and then hitching the cord to his ankle, returned to the deck.

'Hardly was his back turned, when a long limb was thrust from a hammock opposite, and Doctor Long Ghost, leaping forth warily, whipped the rope from Bob's ankle, and fastened it like lightning to a great lumbering chest, the property of the man who had just disappeared.

'Scarcely was the thing done, when lo! with a thundering bound, the clumsy box was torn from its fastenings, and banging from side to side, flew towards the scuttle. Here it jammed; and thinking that Bob, who was as strong as a windlass, was grappling a beam and trying to cut the line, the jokers on deck strained away furiously. On a sudden the chest went aloft, and striking against the mast, flew open, raining down on the heads of the party a merciless shower of things too numerous to mention.

'Of course the uproar roused all hands, and when we hurried on deck, there was the owner of the box, looking aghast at its scattered contents, and with one wandering hand taking the altitude of a bump on his head.'

The next incident that relieved the monotony of the voyage was the death and burial in the sea of two men who had been for some time sick. Still the vessel went on its course, no soul on board knowing whither they were steering, or what they were to be about, except the mate. At length the men, who were accustomed to keep a look-out for whales from the mast-head, declared off from the duty; but the mate considered this of little consequence, observing carelessly, that the whales they would soon get among 'were so tame, that they made a practice of coming round ships and scratching their backs against them.' The projects, however, of this officer, whatever they may have been, were put an end to by the likelihood there appeared to be of the captain dying, for he had been ailing for some time; the ship's course was now at length changed for Tahiti, where she arrived in due time. Here the author, Doctor Long Ghost, and others, were desirous of parting company with the rats and cockroaches; but the authority of the British consul being invoked in favour of the vessel, they were offered their choice between the jail on shore and the fore-castle of the 'Little Jewel': they of course preferred the former.

Tahiti, except in the external aspect of nature, is by no means described as the paradise it was once reputed to be. All the vices of civilisation are here under a different form—and even all the miseries, including poverty and hunger. The author, however, and Doctor Long Ghost, had an opportunity, in the course of their adventures, of seeing the interior, where life presents itself in a different aspect. On one occasion, 'with whoop and halloo, we ran down the hills, the villagers soon hurrying forth to see who were coming. As we drew near, they gathered round, all curiosity to know what brought the "karhowries" into their quiet country. The doctor contriving to make them understand the purely social object of our visit, they gave us a true

Tahitian welcome; pointing into their dwellings, and saying they were ours as long as we chose to remain.

'We were struck by the appearance of these people, both men and women, so much more healthful than the inhabitants of the bays. As for the young girls, they were more retiring and modest, more tidy in their dress, and far fresher and more beautiful than the damsels of the coast.

'That night we abode in the house of Rartoo, a hospitable old chief. It was right on the shore of the lake; and at supper, we looked out through a rustling screen of foliage upon the surface of the starlit water.

'The next day we rambled about, and found a happy little community, comparatively free from many deplorable evils to which the rest of their countrymen are subject. Their time, too, was more occupied. To my surprise the manufacture of tappa was going on in several buildings. European calicoes were seldom seen, and not many articles of foreign origin of any description.'

The adventurers now resolved to proceed to the court of Queen Pomare, in hopes of being promoted to some post of honour and profit near her majesty.

'Nor was this expectation altogether Quixotic. In the train of many Polynesian princes, roving whites are frequently found; gentlemen pensioners of state, basking in the tropical sunshine of the court, and leading the pleasantest lives in the world. Upon islands little visited by foreigners, the first seaman that settles down is generally domesticated in the family of the head chief or king, where he frequently discharges the functions of various offices, elsewhere filled by as many different individuals. As historiographer, for instance, he gives the natives some account of distant countries; as commissioner of the arts and sciences, he instructs them in the use of the jack-knife, and the best way of shaping bits of iron hoop into spear-heads; and as interpreter to his majesty, he facilitates intercourse with strangers; besides instructing the people generally in the uses of the most common English phrases, civil and profane, but oftener the latter.

'These men generally marry well; often, like Hardy of Hannamanoo, into the blood-royal. Sometimes they officiate as personal attendant, or first lord in waiting to the king. At Amboi, one of the Tonga Islands, a vagabond Welshman bends his knee as cupbearer to his cannibal majesty. He mixes his morning cup of "arva," and, with profound genuflections, presents it in a cocoa-nut bowl, richly carved. Upon another island of the same group, where it is customary to bestow no small pains in dressing the hair—frizzing it out by a curious process into an enormous pope's-head—an old man-of-war's-man fills the post of barber to the king.'

This journey was not attended by tavern bills. 'The Polynesians carry their hospitality to an amazing extent. Let a native of Waiurur, the westernmost part of Tahiti, make his appearance as a traveller at Par-toooye, the most easterly village of Imeeo, though a perfect stranger, the inhabitants on all sides accost him at their doorways, inviting him to enter, and make himself at home. But the traveller passes on, examining every house attentively, until at last he pauses before one which suits him, and then exclaiming, "*Ah, ena maitai!*" ("This one will do, I think!"), he steps in, and makes himself perfectly at ease, flinging himself upon the mats, and very probably calling for a nice young cocoa-nut, and a piece of toasted bread-fruit, sliced thin, and done brown.'

This is the description of a dinner:—"First, a number of "pooroo" leaves, by way of plates, were ranged along on one side; and by each was a rustic nut-bowl, half-filled with sea-water, and a Tahitian roll, or small bread-fruit, roasted brown. An immense flat calabash, placed in the centre, was heaped up with numberless small packages of moist steaming leaves; in each was a small fish, baked in the earth, and done to a turn. This pyramid of a dish was flanked on either side by an ornamental calabash. One was brimming with the

golden-hued "poeë," or pudding, made from the red plantain of the mountains; the other was stacked up with cakes of the Indian turnip, previously macerated in a mortar, kneaded with the milk of the cocoa-nut, and then baked. In the spaces between the three dishes were piled young cocoa-nuts, stripped of their husks. Their eyes had been opened and enlarged, so that each was a ready-charged goblet.

'There was a sort of side-cloth in one corner, upon which, in bright buff jackets, lay the fattest of bananas; "avees," red-ripe; guavas, with the shadows of their crimson pulp flushing through a transparent skin, and almost coming and going there like blushes; oranges, tinged here and there berry-brown; and great jolly melons, which rolled about in very portliness. Such a heap! All ruddy, ripe, and round, bursting with the good cheer of the tropical soil from which they sprang!'

The wanderers at length find themselves comfortably housed with a native family, whose abode was so fine, that they were at first afraid to enter.

'While standing irresolute, a voice from the nearest house hailed us, "*Aramai! aramai, harhowree!*" ("Come in! come in, strangers!")'

'We at once entered, and were warmly greeted. The master of the house was an aristocratic-looking islander, dressed in loose linen drawers, a fine white shirt, and a sash of red silk tied about the waist, after the fashion of the Spaniards in Chili. He came up to us with a free frank air, and striking his chest with his hand, introduced himself as Ereemear Po-Po; or, to render the Christian name back again into English, Jeremiah Po-Po.

'We gave our names in return, upon which he bade us be seated; and sitting down himself, asked us a great many questions in mixed English and Tahitian. After giving some directions to an old man to prepare food, our host's wife, a large, benevolent-looking woman, upwards of forty, also sat down by us. In our soiled and travel-stained appearance, the good lady seemed to find abundant matter for commiseration; and all the while kept looking at us piteously, and making mournful exclamations.

'But Jeremiah and his spouse were not the only inmates of the mansion.

'In one corner, upon a large native couch, elevated upon posts, reclined a nymph, who, half-veiled in her own long hair, had yet to make her toilet for the day. She was the only daughter of Po-Po, and a very beautiful little daughter she was. They called her Loo—a name rather pretty and genteel, and therefore quite appropriate; for a more genteel and lady-like little damsel there was not in all Imeeo.

'When we first entered, Po-Po was raking smooth the carpet of dried ferns which had that morning been newly laid; and now that our meal was ready, it was spread on a banana-leaf, right upon this fragrant floor. Here we lounged at our ease, eating baked pig and bread-fruit off earthen plates, and using, for the first time in many a long month, real knives and forks.

'Arfreetee, Po-Po's wife, was a right motherly body. The meal over, she recommended a nap; and upon our waking much refreshed, she led us to the doorway, and pointed down among the trees, through which we saw the gleam of water. Taking the hint, we repaired thither; and finding a deep shaded pool, bathed, and returned to the house. Our hostess now sat down by us; and after looking with great interest at the doctor's cloak, felt my own soiled and tattered garments for the hundredth time, and exclaimed plaintively, "*Aa nuce nuce ole manee! ole manee!*" ("Alas! they are very, very old! very old!")'

'Going to a chest filled with various European articles, she took out two suits of new sailor-frocks and trousers; and presenting them with a gracious smile, pushed us behind a calico screen, and left us. Without any fastidious scruples, we donned the garments; and what with the meal, the nap, and the bath, we now came forth like a couple of bridegrooms.

'Evening drawing on, lamps were lighted. They were very simple—the half of a green melon, about one-third full of cocoa-nut oil, and a wick of twisted tappa floating on the surface. As a night-lamp, this contrivance cannot be excelled; a soft dreamy light being shed through the transparent rind.

'As the evening advanced, other members of the household, whom as yet we had not seen, began to drop in. There was a slender young dandy in a gay striped shirt, and whole fathoms of bright figured calico tucked about his waist, and falling to the ground. He wore a new straw-hat also, with three distinct ribbons tied about the crown; one black, one green, and one pink. Shoes or stockings, however, he had none.

'There were a couple of delicate olive-cheeked little girls—twins—with mild eyes and beautiful hair, who ran about the house half-naked, like a couple of gazelles. They had a brother somewhat younger, a fine dark boy, with an eye like a woman's. All these were the children of Po-Po.

'Then there were two or three queer-looking old ladies, who wore shabby mantles of soiled sheeting; which fitted so badly, and withal had such a second-hand look, that I at once put their wearers down as domestic paupers—poor relations, supported by the bounty of My Lady Arfreetee. They were sad, meek old bodies; said little, and ate less; and either kept their eyes on the ground, or lifted them up deferentially. The semi-civilisation of the island must have had something to do with making them what they were.

'Before retiring, the entire household gathered upon the floor; and in their midst, Po-Po read aloud a chapter from a Tahitian Bible. Then kneeling with the rest of us, he offered up a prayer. Upon its conclusion, all separated without speaking. These devotions took place regularly every night and morning. Grace, too, was invariably said by this family both before and after eating.

'The house itself was built in the simple but tasteful native style. It was a long, regular oval, some fifty feet in length, with low sides of cane-work, and a roof thatched with palmetto leaves. The ridge-pole was, perhaps, twenty feet from the ground. There was no foundation whatever, the bare earth being merely covered with ferns; a kind of carpeting which serves very well, if frequently renewed; otherwise, it becomes dusty, and the haunt of vermin, as in the huts of the poorer natives.

'Beside the couches, the furniture consisted of three or four sailor chests; in which were stored the fine wearing-apparel of the household—the ruffled linen shirts of Po-Po, the calico dresses of his wife and children, and divers odds and ends of European articles—strings of beads, ribbons, Dutch looking-glasses, knives, coarse prints, bunches of keys, bits of crockery, and metal buttons. One of these chests—used as a handbox by Arfreetee—contained several of the native hats (coal-scuttles), all of the same pattern, but trimmed with variously-coloured ribbons. Of nothing was our good hostess more proud than of these hats and her dresses. On Sundays, she went abroad a dozen times; and every time, like Queen Elizabeth, in a different robe.'

The visit of the adventurers to court is unsuccessful, and the author at length determines upon going again to sea. 'The next day I paddled off to the ship, signed and sealed, and stepped ashore with my "advance"—fifteen Spanish dollars tasselling the ends of my neck-handkerchief.

'I forced half of the silver on Long Ghost; and having little use for the remainder, would have given it to Po-Po as some small return for his kindness; but, although he well knew the value of the coin, not a dollar would he accept.'

The following is the conclusion of this amusing and original book:—'I prevailed upon Po-Po to drink a parting shell; and even little Loo, actually looking conscious that one of her hopeless admirers was about

leaving Partoowye for ever, sipped a few drops from a folded leaf. As for the warm-hearted Arfreetee, her grief was unbounded. She even besought me to spend my last night under her own palm-thatch; and then, in the morning, she would herself paddle me off to the ship.

'But this I would not consent to; and so, as something to remember her by, she presented me with a roll of fine matting, and another of tappa. These gifts placed in my hammock, I afterwards found very agreeable in the warm latitudes to which we were bound; nor did they fail to awaken most grateful remembrances.

'About nightfall we broke away from this generous-hearted household, and hurried down to the water.

'An hour or two after midnight, everything was noiseless; but when the first streak of the dawn showed itself over the mountains, a sharp voice hailed the fore-castle, and ordered the ship unmoored. The anchors came up cheerily; the sails were soon set; and with the early breath of the tropical morning, fresh and fragrant from the hill-sides, we slowly glided down the bay, and were swept through the opening in the reef. Presently we "hove to," and the canoes came alongside to take off the islanders who had accompanied us thus far. As he stepped over the side, I shook the doctor long and heartily by the hand. I have never seen or heard of him since.

'Crowding all sail, we braced the yards square; and the breeze freshening, bowled straight away from the land. Once more the sailor's cradle rocked under me, and I found myself rolling in my gait.

'By noon, the island had gone down in the horizon; and all before us was the wide Pacific.'

ALL FOR THE BEST.

A TALE.

I do not think there could be found in the three kingdoms a blither little old maid than Miss Mellicent Orme, otherwise Aunt Milly, for so she was universally called by her nephews and nieces, first, second, and third cousins—nay, even by many who could not boast the smallest tie of consanguinity. But this sort of universal aunthood to the whole neighbourhood was by no means disagreeable to Miss Milly, for in a very little body she had a large heart, of a most India-rubber nature; not indeed as the simile is used, in speaking of female hearts, that 'never break—but always stretch.' But Miss Milly's heart possessed this elastic nature in the best sense—namely, that it ever found room for new occupants; and, moreover, it was remarkable for its quality of effacing all unkindness or injuries as easily as India-rubber removes pencil marks from paper.

Aunt Milly—I have some right to call her so, being her very nephew, Godfrey Estcourt—was an extremely little woman. She had pretty little features, pretty little hands and feet, a pretty little figure, and always carried with her a pretty little worked bag, in whose mysterious recesses all the children of the neighbourhood loved to dive, seldom returning to the surface without some pearl of price, in the shape of a lozenge or a sugar-plum. Her dress was always neat, rather old-fashioned perhaps, but invariably becoming; her soft brown hair—it really was brown still—lay smoothly braided under a tiny cap; her white collar was ever smooth; indeed Aunt Milly's whole attire seemed to have the amazing quality of never looking worn, soiled, or dusty, but always fresh and new. Yet she was far from rich, as every one knew; but her little income was just enough to suffice for her little self. She lived in a nutshell of a house, with the smallest of small hand-maidens; indeed everything about Aunt Milly was on the diminutive scale. She did not live much at home, for she was everywhere in request—at weddings, chris-

tenings, and, to her credit be it spoken, Aunt Milly did not turn her feet from the house of mourning. She could weep with the sorrowful, yet somehow or other she contrived to infuse hope amidst despair. And in general her blithe nature converted all life's minor evils into things not worth lamenting about.

Every one felt that Aunt Milly's entrance into their doors brought sunshine. She was a sunbeam in herself: there was cheerfulness in her light step, her merry laugh: the jingling of the keys in her pocket, dear little soul! was musical. She had a word of encouragement for all, and had an inclination to look on the sunny side of everything and everybody. No one was more welcome in mirthful days, no one more sought for in adversity, for she had the quality of making even trouble seem lighter; and her unfailing motto was, 'All happens for the best.'

All my schoolboy disasters had been deposited in Aunt Milly's sympathising ear; and when I grew up, I still kept to the old habit. I came to her one day with what I considered my first real sorrow: it was the loss, by the sudden failure of a country bank, of nearly all the few hundreds my poor father had laid up for me. My sad news had travelled before me, and I was not surprised to see Aunt Milly's cheerful face really grave as she met me with, 'My dear boy, I am very sorry for you.'

'It is the greatest misfortune I could have,' I cried. 'I wish that wretch Sharples—'

'Don't wish him anything worse than he has to bear already, poor man, with his large family,' said Aunt Milly gently.

'But you do not know all I have lost. That—that Laura——' and I stopped, looking, I doubt not, very silly.

'You mean to say, Godfrey, that since, instead of having a little fortune to begin the world with, you have hardly anything at all, Miss Laura Ashton will not consider that her engagement holds. I expected it.'

'Oh, Aunt Milly, she is not so mean as that; but we were to have been married in two years, and I could have got a share in Mortlake's office, and we should have been so happy! All is over now. Her father says we must wait, and Laura is to be considered free. Life is nothing to me now. I will go to America—or shoot myself.'

'How old are you, Godfrey?' asked Aunt Milly with a quiet smile that rather annoyed me.

'I shall be twenty next June,' I said. Young people always put their age in the future tense, it sounds better.

'It is now July, so that I may call you nineteen and a month. My dear boy, the world must be a horrible place indeed for you to get tired of it so soon. I would advise you to wait a little while before you get so very desperate.'

'Aunt Milly,' I said, turning away, 'it is easy for you to talk—you were never in love.'

A shadow passed over her bright face, and her eye glanced sadly at a mourning ring on the little hand; but Aunt Milly did not answer my allusion.

'I do not think any boy of nineteen is doomed to be a victim to loss of fortune or hopeless love,' she said after a pause. 'My dear Godfrey, this will be a trial of your Laura's constancy, and of your own patience and industry. Depend upon it, all will turn out for the best.'

'Oh!' I sighed, 'you talk very well, Aunt Milly; but what can I do?'

'I will tell you. You are young, clever, and have been for two years in a good profession. It will be your own fault if you do not rise in the world. Every man is in a great measure the architect of his own fortunes: and where, as in your case, the foundation of a

good education is laid, so much the easier is it to raise the superstructure. You may be a rich man yet by your own exertions, and money earned is ten times sweeter than money received by gift or legacy.'

This was the longest and gravest speech I had ever heard from Aunt Milly's lips. Its truth struck me forcibly, and I felt rather ashamed of having so soon succumbed to ill-fortune: it seemed cowardly, and unworthy the manly dignity of nearly twenty years. Aunt Milly, with true feminine tact, saw her advantage, and followed it up.

'Now, as to your heart-troubles, my dear nephew. To tell the truth, I hardly believe in boyish love; there is generally more of fancy and romance than real affection in it. Do not be vexed, Godfrey, but I should not be surprised if, five years hence, you tell me how fortunate it was that this trial came to prove the steadiness of Miss Ashton's regard, or your own, before you married her. Men rarely see with the same eyes at nineteen and twenty-five.'

I began with good old Will Shakespeare's declaration—

'Doubt that the stars are fire,
Doubt that the sun doth move,
Doubt truth to be a liar,
But never doubt my love.'

Aunt Milly laughed. 'As both these astronomical facts are rather questionable, you must excuse my doubting a little still. But time will show. Meanwhile do not despair; be diligent, and be careful of the little you have left. Matters might have been worse with you.'

'Ah, Aunt Milly, what a cheerful heart you have! But trouble never comes to you as it does to other people.'

'You are a little mistaken, Godfrey. At this moment I am in greater distress than you. By Sharples's failure I have lost every farthing I had in the world.'

I was struck dumb with surprise and regret. Poor dear Aunt Milly! when she was listening to my lamentations, and consoling me, how little did I know that she was more unfortunate than myself! And yet she neither complained nor desponded, but only smiled—a little sadly perhaps—and said she knew even this disaster was 'all for the best,' though she could not see it at the time. She calmly made preparations for quitting her pretty home, confided her little handmaid to one cousin, in whose kitchen Rachel was gladly admitted, gave her few household pets to another, and prepared to brave the wide world as she best could. Some unfeeling people forgot Aunt Milly in her trouble; but the greater part of her friendly circle proved how much they esteemed and valued her. Some asked her to visit them for a month, three months, a year: indeed, had she chosen, Aunt Milly might have spent her life as a passing guest among her friends; but she was too proud to do so.

At last a third or fourth cousin—a widower of large fortune—invited Miss Milly to reside at his house, as chaperon to his two daughters, young girls just growing up into womanhood. This proposal, kindly meant, was warmly accepted; and Aunt Milly set forward on her long journey, for Elphinstone Hall was some hundred miles off—a formidable distance to one who had never been a day's journey from her own home; now, alas! hers no more! Still, neither despondency nor fear troubled her blithe spirit, as little Miss Milly set out with her valorous nephew; for I had pleaded so earnestly my right to be her squire to Mr Elphinstone's door, that the concession was yielded at last.

Of all the gloomy-looking old avenues that ever led to baronial hall, the one we passed through was the gloomiest. It might have been pretty in May, but on a wet day in October it was most melancholy. Poor Aunt Milly shivered as the wind rustled in the trees, and the dead leaves fell in clouds on the top of the post-chaise. We alighted, and entered a hall equally lugubrious, and not much warmer than the avenue. The solemn old porter was warming his chilled hands at the

tiny fire: he and the house were in perfect keeping—dreary, dull, and melancholy. The master was much in the same style: a tall black figure, with a long face and a white neckcloth, was the personified idea left behind by Mr Elphinstone. When he was gone, I earnestly intreated Aunt Milly to return with me, and not stay in this desolate place; but she refused.

'My cousin seems kind,' she said: 'he looked and spoke as though he were glad to see me.' (I was too cold to hear or see much certainly, but I did not notice this very friendly reception.) 'My dear Godfrey,' Aunt Milly continued, 'I will stay and try to make a home here: the two girls may be amiable, and then I shall soon love them: at all events, let us hope for the best.'

My hopes for poor Aunt Milly all vanished into thin air when, at the frigid dinner-table, where the very estates seemed made of stone, I saw two young ladies of fifteen or thereabouts: one the wildest and rudest hoyden that ever disgraced feminine habiliments; the other, a pale stooping girl, with sleepy blue eyes, and lank fair hair, who never uttered a word, nor once lifted her eyes from the tablecloth.

'What will become of poor Aunt Milly?' I thought internally. Yet there she was, as cheerful as ever, talking to that solemn old icicle Mr Elphinstone; listening patiently to the lava-flood of Miss Louisa's tongue; and now and then speaking to Miss Euphemia, whose only answer was a nod of the head, or a stare from her immense blue eyes. 'Well!' I mentally ejaculated. 'Aunt Milly's talent for making the best of everything will be called into full requisition here, I suspect.'

Nevertheless, when we parted, she assured me that she was quite content; that she would no doubt be very comfortable at the Hall.

'But those two dreadful girls, how will you manage them, Aunt Milly?' and a faint vision of the tall stout Louisa knocking my poor little aunt off her chair, in anger, came across my mind's eye.

'Poor things! they have no mother to teach them better. I am sorry for them: I was a motherless child myself,' said Aunt Milly softly. 'They will improve by and by: depend upon it, Godfrey, all will turn out well for both you and me.'

'Amen!' said I in my heart; for I thought of my own Laura, how different she was from the Miss Elphinstones! And the image of my beloved eclipsed that of desolate Aunt Milly. I fear, before I had travelled many miles from the Hall.

Aunt Milly's epistles were not very frequent; for, like many excellent people, she disliked letter-writing, and only indulged her very particular friends with a few lines now and then, in which she fully acted up to the golden rule, 'Say what you have to say in as few words as you can, and then say no more.' Thus my information as to how matters were going on at Elphinstone Hall was of a very slender nature. However, when a few months had rolled by, chance led me into the neighbourhood, and I surprised Aunt Milly with a visit from her loving nephew.

It was early spring, and a few peeping primroses brightened the old avenue. Underneath the dining-room windows, too, was a gay bed of purple and yellow crocuses, which I thought bore tokens of Aunt Milly's care; she was always so fond of flowers. I fancied the Hall did not look quite so cheerless as before; the bright March sunbeams enlivened, though they could not warm it. In a few moments appeared Aunt Milly herself, not in the least altered, but as lively and active as ever.

She took me into her own little sitting-room, and told me how the winter had passed with her. It had been rather a gloomy one, she acknowledged: the girls were accustomed to run wild; Louisa would have her own way; but then she was easily guided by love, and her nature was frank and warm. Phemie, the pale girl, who had been delicate from her cradle, was rather

indolent, but—(oh what a blessing these charitable *buts* are sometimes!)—but then she was so sweet and gentle. I own when I again saw the young damsels, thus described by Aunt Milly, I did not perceive quite such a marvellous change: Louisa seemed nearly as talkative, and her sister nearly as insipid, as ever; still there was a slight improvement even to my eyes, and I gladly allowed Aunt Milly the full benefit of that loving glamour which was cast by her hopeful creed and sweet disposition.

'But now, Godfrey, how fares it with you?' said my good aunt. 'How is Laura? and how are you getting on in the world?'

I could give but a melancholy answer to these questions; for I had to work hard, and law was a very dry study. Besides, many people looked coldly on me after they knew I was poorer than I had been; and even Laura herself was not so frank and kind. Vague jealousies were springing up in my heart for every smile she bestowed elsewhere; and these were not few. I was, in truth, far from happy; and so I told Aunt Milly, adding, 'If Laura does not love me, I don't care what becomes of me.'

Aunt Milly smiled, and then looked grave. 'My dear Godfrey, if Laura married to-morrow, you would recover in time from her loss.'

'No, never! To lose the girl I love, is to lose everything.'

'You do not yet know what real love is, my dear boy. I never believed that Laura Ashton was capable of exciting the lasting affection of a true heart, or worthy to retain it. But we shall see. Once more, have a good courage; work hard at your profession, and think as little of Laura as you can. If she ever did love you, she does so still, and will as long as you keep constant to her. Alas for the one whose love survives his who first awakened it! If Laura's affection be not of this firm nature, it is not worth the winning, and its loss will soon be no pain at all.'

I did not agree with Aunt Milly's theory; but I said no more; my heart was too sore. She took me over the house and grounds: both looked cheerful under the influence of the soft spring; and then she told me how kind Mr Elphinstone was, and how he had been gradually weaned from his solitary life to take pleasure in the society of his daughters.

'And I hope he is grateful to you, who have made them at all endurable?' I said.

Aunt Milly smiled. 'Yes, I believe he is: but I have done only what I ought: the girls both love me so much; and it is sufficient reward to see them improved.'

I did not see Mr Elphinstone, but I earnestly hoped the solemn, coldly polite, middle-aged gentleman had shared in the general amelioration and reform effected by the cheerful-hearted Miss Milly.

Months had glided into years ere I again saw Aunt Milly. Everything had changed with me: from a boy, I had grown a man, struggling with the world. I had followed Aunt Milly's advice, and had begun to reap the fruit of it, in the good opinion of those whose opinion was worth having. I had proved also the truth of her old saying, 'How sweet is the bread of one's own labour!' Another of her prophecies, alas! had come but too true. Laura Ashton was lost to me: she had married an officer of dragons, and had left the country. But I will not speak of this, for I did love her very much once; and in spite of Aunt Milly's sage speeches, no one can quite forget his boyish fancy. However, the cares of life left me no time to ponder mournfully over my first love.

When I next visited Elphinstone Hall, it was in the golden days of midsummer. I thought I had never beheld a more lovely place. The old trees were so shady and full of leaves; the grassy lawn so very green; the flower-garden so bright with blossoms. Age and youth were not more different than the old cheerless Hall of former times and the beautiful spot I now looked

upon. Even Aunt Milly seemed to share in the general rejuvenescence. The two years which had changed me so much, had not made her look a day older. She had the same clear, fresh, cheerful face, and neat little figure; both perhaps a little rounder, the result of a happy life and few cares. Her dress was as tasteful as ever, but not quite so precise, and it was of richer materials. She wore, too, various handsome articles of jewellery; a remarkable circumstance for unpretending Aunt Milly. I thought her pupils must be at least kind and generous in presents.

We had not sat talking long, when a very graceful girl crossed the lawn to the French window of Aunt Milly's room.

'I will come soon: go and take your walk, Phemie dear,' said Aunt Milly.

Wonder of wonders! Could that beautiful fair face and golden ringlets which I saw through the open window belong to the lackadaisical Miss Euphemia of old? I absolutely started from my chair.

'You don't mean to say, Aunt Milly, that that lovely girl is Miss Elphinstone?'

'Most certainly,' said Aunt Milly, laughing heartily—her own musical laugh.

'Well, if ever I saw such a transformation! You are as much a fairy as Cinderella's godmother.'

'Not at all; I only did as a gardener does with uncultivated ground; I pulled up the weeds, and planted flowers. As for Phemie's beauty, I never thought her ugly, though you were too much occupied with your disgust at the place to perceive that she really had a fair skin and pretty features. I have only made the best of what I found.'

'And how has Miss Louisa turned on your hands?'

I asked smiling.

'Look at her; she is coming up the avenue on horse-back.'

And a very graceful fearless horsewoman the quondam hoyden seemed: her wildness was subdued into gay, but not unladylike manners: in short, Louisa had become what many men would admire as a fine lively girl.

'Why, Aunt Milly,' I said, 'you must have grown quite attached to these girls; it will really be painful for you to leave them.'

'I do not think of leaving them very soon,' said Aunt Milly, casting down her eyes, and playing with her gold watch-chain, while a very faint deepening of her still fair cheek, and a scarcely perceptible smile hovering round her mouth, were distinctly visible.

'Indeed!' said I inquiringly.

'Yes; Mr Elphinstone is very kind; he does not wish me to go: the girls love me; and my cousin—'

'Loves you quite as much, dear Aunt Milly!' I cried, at last arriving at the truth. 'I don't see how he could possibly help it; and so I wish you joy.'

Aunt Milly muttered something in return, blushed as prettily as a girl of fifteen, and at last fairly ran out of the room.

'After all, everything *was* for the best!' thought I, as I attended the quiet wedding of Mr Elphinstone and his second wife. He did not look half so grave and austere as I fancied, and really was a very fine-looking man, in spite of his fifty years; and if his winning little wife trod only ten years behind him in the road of life, why, I have seen many older-looking brides who were not thirty by the church register: and, after all, what matter years when the heart is still young? Mr Elphinstone did right to give his daughters a second mother in her who had already been such to them; and Aunt Milly, too, what was there ludicrous in her having found a worthy husband, and a happy home against her old age?

I have nothing more to add, except that I have been for these two years a married man myself; and therefore fully sympathised with Aunt Milly's keeping of her seventh wedding anniversary last week. I may just mention *en passant* that I do not call her Aunt

Milly now, happening to be her son-in-law as well as nephew. Perhaps, to clear up all mysteries, I had better confess that my wife has fair hair, sweet blue eyes, and that her name is Euphemia.

'THE ANCIENT WORLD.'

IN the progress of science, it must of necessity happen that a desire will prevail for a general view of the advances made—for a *resumé* of all the scattered facts contributed by isolated workers, their bearing upon each other, and the new views to be deduced from them. This has just been done for geology, by the publication of a work* well calculated to convey a clear idea of the physical history of the earth as connected with this science. But few persons are possessed of any well-defined knowledge of this interesting subject—of the mighty changes which have taken place in the earth's crust—of the deposition of its various strata—of its animal and vegetable inhabitants in remote times; and the work now under consideration will go far to supply the existing want, and perhaps incite a closer attention to this portion of the vast field of natural knowledge.

Professor Ansted sets out by observing that the value of geological knowledge cannot be less than that of geographical; that, if it be desirable to know something of the position and climate of different countries, it is equally essential to have an acquaintance with their underlying strata, seeing that on the latter so many physical advantages depend. He further compares his position as natural historian of the earth with that of a writer about to give a history of a people whose chief evidences lie in the remains, whether architectural or otherwise, which a nation may leave behind them; and he observes that 'it is possible to make out an account of the successive events that have taken place in various parts of the world, not only before the earth was inhabited by civilised men, but even when man had not yet been created.'

The memorials or archives of the ancient world exist in the shape of fossils, and their value, as positive evidence of what has taken place on the earth, is insisted on by nearly every writer who has paid any attention to the subject. Fossils are to the geologist what a half-effaced inscription is to the antiquary, or a fragment of an old book to the bibliographer—something on which they can reason back to complete and definite conclusions. A recent writer has called them 'medals of creation,' so clearly do they mark the various reigns of different races on the earth. But we have to begin with a period prior to their existence. It is generally known that granite is considered 'as the foundation and the main solid framework of our globe;' and the manner in which it contributes to the formation of other rocks is highly interesting. 'If we imagine common granite coarsely pounded and thrown into a vessel of water, it will arrange itself in the bottom of the vessel in a condition very much like that of gneiss, which is indeed nothing else than stratified granite. If the water in which the pounded rock is thrown is moving along at a slow rate, and that part of the granite called *felspar* happens to be somewhat decomposed, as it often is, then the felspar (which is so truly *clay*, that it makes the best possible material for the use of the potteries), and the thin shining plates of mica, will be carried farther by the water than the lumps of white quartz or flint sand, which, with the other two ingredients, made up the granite; and the two former will be deposited in layers, which, by passing a galvanic current through them, would in time become mica-schist. If the mica were absent, or if the clay were deposited without it, owing to any cause, then a similar galvanic current would turn the deposit into something like *clay-slate*.' We have thus the existence of these three 'mechanically-arranged' rocks accounted for: they are always

* The Ancient World; or Picturesque Sketches of Creation. By D. T. Ansted. M.A. London: Van Nostrand, 1847.

found in connection with the granite, and belong to the period antecedent to the appearance of animal life. In a succeeding series, the silurian rocks, whether in Europe or other parts of the world, we meet with the first proofs of the existence of living beings. Amongst these were species partaking so largely both of the animal and vegetable character, that naturalists were for a time at a loss under which head to classify them. The little coralline animals have been at work for ages, separating carbonate of lime from the sea-water, and building up our present mountain masses of limestone. 'The prodigious extent of the combined and unintermitting labours of these little world-architects,' writes Professor Ansted, 'must be witnessed in order to be adequately conceived or realised. They have built up four hundred miles of barrier reef on the shores of New Caledonia; and on the north-east coast of Australia, their labours extend for one thousand miles in length; and these reefs may average perhaps a quarter of a mile in breadth, and one hundred and fifty feet in depth; and they have been built amidst the waves of the ocean, and in defiance of its fiercest storms!' The ocean at that period presented greater differences of depth than at the present day: it was peopled with trilobites, polypæ, and several others of the same class, among which were the 'crinoids or stone-flowers, more beautiful, perhaps, and more picturesque, than the sea-anemones of our own coast, even when these latter are seen in all their beauty, and with their tendrils and fibres widely expanded and brilliantly coloured.'

In the next stage we find the first traces of fishes, some of which are of the most extraordinary structure and appearance when compared with those with which we are at present familiar. Small at first, the new species increased in size as circumstances favoured their development, and were succeeded by the gigantic *sauroids*, or lizard-fishes. Together with these the ocean abounded with sharks, and millions of invertebrate. 'Imagine,' says the author, 'one of these monstrous animals, a *plesiosaurus*, some sixteen or twenty feet long, with a small wedge-shaped crocodilian head, a long arched serpent-like neck, a short compact body, provided with four large and powerful paddles, almost developed into hands: an animal not covered with brilliant scales, but with a black slimy skin. Imagine for a moment this creature slowly emerging from the muddy banks, and half-walking, half-creeping along, making its way towards the nearest water. Arrived at the water, we can understand from its structure that it was likely to exhibit greater energy. Unlike the crocodile tribe, however, in all its proportions, it must have been equally dissimilar in habit. Perhaps, instead of concealing itself in mud, or among the rushes, it would swim at once boldly and directly to the attack. Its enormous neck stretched out to the full length, and its tail acting as a rudder, the powerful and frequent strokes of its four large paddles would at once give it an impulse, sending it through the water at a very rapid rate. When within reach of its prey, we may almost fancy that we see it drawing back its long neck as it depressed its body in the water, until the strength of the muscular apparatus with which this neck was provided, and the great additional impulse given by the rapid advance of the animal, would combine to produce a stroke from the pointed head which few living animals could resist. The fishes, including, perhaps, even the sharks, the larger cuttle-fish, and innumerable inhabitants of the sea, would fall an easy prey to this monster.'

'But now let us see what goes on in the deeper abysses of the ocean, where a free space is given for the operations of that fiercely carnivorous marine reptile, the *ichthyosaurus*. Prowling about at a great depth, where the reptilian structure of its lungs, and the bony apparatus of the ribs, would allow it to remain for a long time without coming to the air to breathe, we may fancy we see this strange animal, with its enormous eyes directed upwards, and glaring like globes of fire: its length is some thirty or forty feet, its head being

six or eight feet long; and it has paddles and a tail like a shark: its whole energies are fixed on what is going on above, where the *plesiosaurus*, or some giant shark, is seen devouring its prey. Suddenly, striking with its short but compact paddles, and obtaining a powerful impetus by flapping its large tail, the monster darts through the water at a rate which the eye can scarcely follow towards the surface. The vast jaws, lined with formidable rows of teeth, soon open wide to their full extent; the object of attack is approached—is overtaken. With a motion quicker than thought, the jaws are snapped together, and the work is done. The monster becoming gorged, floats languidly near the surface, with a portion of the top of its head and its nostrils visible—like an island covered with black mud—above the water.'

According to Professor Ansted, that portion of the Mexican Gulf bounded by the West India islands and the Isthmus of Darien, covers a tract of land in which operations are going on corresponding to those that produced the secondary formations in various parts of Europe and America—comprising wealden and oolite. Vast additions were made to the tenants of the ocean during the oolitic period: reptiles of an enormous size, and insects, made their appearance; those singular creatures, the belemnite and the ammonite, were then in existence; and the first mammals, creatures about the size of rats, began to run in the forests. We extract another 'picture,' recalling 'the scenes once enacted near some tract of low flat land—a sandy shore of the oolitic period—on which, at a distance, a few solitary palm-trees stand out against the blue sky, but which is backed by a more luxuriant growth of pines and ferns, extending towards the interior, and crowning the tops of distant high ground.

'The first object that attracts attention might be one of the crocodilian animals, with its long slender snout, and with extremities admirably adapted for swimming, combining those peculiarities of structure which distinguish the *teleosaurus*. This animal might be seen moving slowly, and not without difficulty, towards the water; but when there, abruptly darting along, pursuing and devouring the small fishes that swarmed about the shallows; these fishes—sluggish in their nature, and chiefly feeding on the molluscs which inhabit near the shore—falling a ready and abundant prey.... The long-snouted and other crocodiles, which have gorged themselves with fish in the shallow water, now sleep half-buried in the muddy and naked plains on shore. Some of them, eighteen or twenty feet long, advance on land with difficulty, their extremities being far better adapted to swimming than walking.

'Presently a noise is heard, and a large animal advances, whose true nature and habits we are at first at a loss to understand. In its general proportions it is far longer, and also taller, than the largest elephant; its body hangs down near the ground, but its legs are like the trunks of great forest trees, and its feet form an ample base for the vast columns that press upon them. Instead of long tusks, large grinding teeth, and a trunk like that of the elephant, this animal has an exceedingly elongated and narrow snout, armed throughout with ranges of sharp and strong knife-like teeth. The monster approaches, and trodden down with one of its feet, armed with powerful claws, or caught between its long and narrow jaws, our crocodile is devoured in an instant.'

The newest portion of the secondary strata is the chalk, which appears to have been produced by countless millions of the animalcules called *Foraminifera*, by a process analogous to that of the polypes in the formation of coral islands. It has been suggested by Professor Owen, that these minute creatures, existing in such inconceivable numbers, tend to check the superabundance of organic matter which might otherwise become injurious. 'And it is not,' he observes, 'difficult to understand in what way this result is produced; for when the organic matter is in that state of comminution and decay which

immediately precedes its return from the organic to the inorganic world, these wakeful members of nature's invisible police are everywhere ready to arrest the fugitive particles, and turn them back into the ascending stream of animal life. Becoming the food of the smaller infusorial animalcules, they, again, supply the voracity of the larger ones, and of numerous other small animals, which in their turn are devoured by larger ones; and so, by degrees, the substance fit for the nourishment of the most highly-organised classes is brought back by a short route from the extremity of the realms of organised matter.' On reading these observations, it is impossible not to be struck with the extreme simplicity of the means by which nature produces some of her greatest effects: these little animals, so small as not to be seen without the aid of a microscope, have helped to form a large and important part of the material of which our island is composed.

This secondary period opens to us a much wider and higher view of animated nature than that afforded by the primary. Creeping, swimming, and flying reptiles made their appearance; the varieties of radiated animals, molluscs, and encrinetes have increased to an almost bewildering extent; and mammals and traces of birds have been met with. To use Mr Ansted's words, 'There is scarcely any freak of the imagination, however wild or vague, that does not seem surpassed by some reptilian reality during this remarkable period.'

During the 'coal period,' the northern hemisphere is supposed to have consisted of one immense ocean, interspersed with shallows, reefs, and islands, alternately changing their character as they were raised or depressed. Our next 'picture' shows us the appearance of the vegetable kingdom at that interesting period:—'The whole of the interior of the islands may have been clothed with thick forest, the dark verdure of which would only be interrupted by the bright green of the swamps in the hollows, or the brown tint of the fern covering some districts near the coasts. We should see there, for instance, the lofty and widely-spreading lepidodendron, its delicate, feathery, and moss-like fronds clothing in rich luxuriance branches and stems, which are built up like the trunk of the tree-fern, by successive leaf-stalks, that have one after another dropped away, giving, by their decay, additional height to the stem, which might at length be mistaken for that of a gigantic pine.

'There also should we find the sigillaria, its tapering and elegant form sustained on a large and firm basis; enormous matted roots, almost as large as the trunk itself, being given off in every direction, and shooting out their fibres far into the sand and clay in search of moisture. The stem of this tree would appear like a fluted column, rising simply and gracefully without branches to a great height, and then spreading out a magnificent head of leaves like a noble palm-tree. Other trees more or less resembling palms, and others like existing firs, also abounded, giving a richness and variety to the scene; while one gigantic species, strikingly resembling the *alingia*, or Norfolk Island pine, might be seen towering a hundred feet or more above the rest of the forest, and exhibiting tier after tier of branches richly clothed with its peculiar pointed and pear-like leaves, the branches gradually diminishing in size as they approach the apex of a lofty pyramid of vegetation.

'Besides all these, other lofty trees of that day, whose stems and branches are now called *calamites*, existed chiefly in the midst of swamps, and bore their singular branches and leaves aloft with strange and monotonous uniformity. All these trees, and many others that might be associated with them, were perhaps girt round with innumerable creepers and parasitic plants, climbing to the topmost branches of the most lofty amongst them, and enlivening, by the bright and vivid colours of their flowers, the dark and gloomy character of the great masses of vegetation.' Forests such as here described were submerged by some

tremendous convulsion of nature, and by the operation, through long ages, of pressure and other agencies, became converted into coal. Wherever it is found, we meet with most interesting specimens of primeval vegetation.

As we have seen, the appearance of mammals was preceded by the existence of gigantic reptiles; so the period immediately antecedent to the appearance of man on the earth was the era of gigantic quadrupeds, including the well-known megatherium, who furnishes the subject of another striking 'picture.' Nature seems to have done her utmost as regards the size and development of one species before introducing another to the world. These enormous animals belong to the tertiary, or modern period, when the latest change of surface took place, adapting it to the various races of animals by which it was to be inhabited. After many interesting particulars respecting the distribution of quadrupeds in various countries, and in all climates—the *Sivatherium*—the *Dinornis*, a bird, by the side of which the ostrich is a dwarf—the glyptodon, or monster armadillo—we come to our concluding 'picture:—'Presently,' writes Mr Ansted, 'the megatherium himself appears, toiling slowly on from some great tree laid low, and quite stripped of its green covering. The earth groans under the enormous mass; each step bears down and crushes the thickly-growing reeds and other plants; but the monster continues to advance towards a noble tree, the monarch of this primeval forest. "For a while he pauses before it, as if doubting whether, having resisted the storms of so many seasons, it will yield even to his vast strength. But soon his resolution is taken. Having set himself to the task, he first loosens the soil around the tree to a great depth by the powerful claws on his fore-feet, and in this preliminary work he occupies himself for a while; and now observe him carefully. Marching close to the tree, watch him as he plants his monstrous hind-feet carefully and earnestly, the long projecting claw taking firm and deep hold of the ground. His tail is so placed as to rest on the ground and support the body. The hind-legs are set, and the animal, lifting itself up like a huge kangaroo, grasps the tree with its fore-legs at as great a height as possible, and firmly grapples it with the muscles of the trunk, while the pelvis and hind-limbs, animated by the nervous influence of the unusually large spinal cord, combine all their forces in the effort about to be made. And now conceive the massive frame of the megatherium convulsed with the mighty wrestling, every vibrating fibre reacting upon its bony attachment with the force of a hundred giants: extraordinary must be the strength and proportions of the tree, if, when rocked to and fro, to right and left, in such an embrace, it can long withstand the efforts of its assailant."* The tree at length gives way; the animal, although shaken and weary with the mighty effort, at once begins to strip off every green twig.'

Although, at first, there may appear to be a great deal of unnecessary waste and cruelty in the destruction that prevailed both in the animal and vegetable kingdoms, yet, as has been shown in some recent papers in this Journal on 'Nature at War,' wherever there is indefinite increase, the proper balance can only be maintained by indefinite decrease; and the philosopher, while pushing his investigations into the operations of nature, finds that every event, every action, takes place in obedience to some law—often beyond our comprehension, but yet ordained for the wisest ends.

Mr Ansted's book is far from exhausting the subject: he considers it but as an outline of the vast field of study which it comprehends. We commend the work as one, from its style and mode of treatment, likely to do good service to the cause of science, to dispel some of the darkness with which it has been shrouded, and lead to exalted views. To conclude in the author's words: can more wonderful proofs of Creative Power be found than

* Owen on the *Mytodon*.

'that in this great plan, according to which our globe was created, everything should be foreseen and provided against, that everything should succeed in its time and place, that each organised being should perform the task allotted to it, and retire when its work was done, having assisted to carry on, without interruption, and without interference, the great and uniform system? The perfect relation of each animal and vegetable to the time and place allotted to it, is no less marked and certain than that admirable adaptation of every part in the individual, which is known to be so necessary to its comfort, and even its existence. The whole system is one: it is the result of one Mind, of one Will, of one Power. It is governed by a few simple laws, which no power but that which instituted them can possibly interfere with, and which, so far as we can judge, never have been interfered with. It is permitted to man to become acquainted, by careful observation, with some of the methods thus adopted, and the laws imposed; and the power being given, it is surely incumbent on him to employ it—humbly indeed, and cautiously, but earnestly, and with an honest desire to discover truth, whatever that truth may be, or however it may clash with his preconceived opinions.'

AN EXTRAORDINARY LINGUIST.

AN aptitude for acquiring languages is frequently possessed by individuals who show no other symptoms of mental superiority; and sometimes this talent exists where the other faculties are even below mediocrity. A remarkable case of this kind occurred in a character who was well known in Liverpool about a dozen of years ago, and of whom a description has been given by the late William Roscoe.

Richard Roberts Jones was the son of a poor man, who was born in the year 1780, and resided at Aberdaron, on the wildest part of the coast of Wales. His father was by trade a carpenter; but availing himself of his situation, he sometimes engaged in fishing, and occasionally made trips in a small boat to Liverpool. Richard was the second of three children, and as his father's circumstances did not permit of idleness, he attempted to bring him up to his own business. But Richard was not fitted, either bodily or mentally, for regular daily labour. He had a weakness of eyesight, and evidently a deficiency of mental capacity, and that want of ordinary discretion which is necessary for discharging the most common duties of life. At the age of nine his mother taught him to read the Welsh Bible. He then attempted to learn the English Bible, but found it very difficult; and indeed he never acquired that facility in English which he did in other languages. At fifteen years of age he began to study Latin with the assistance of a boy in the parish school of Aberdaron. Although he never had an opportunity of attending the school with other children, he frequently contrived to get into it when the other boys had left it; and from the use of the books he found there, he is said to have learned more in one month than any other boy could learn in six. About the same time he taught himself to write. The hand is peculiar, but very distinct, and he applied it with facility to every language with which he became acquainted. When about nineteen years of age he purchased a Greek grammar from a Welsh poet of the district, and, by assiduous study, speedily acquired as much knowledge as enabled him to read the language with tolerable facility. By further application he easily mastered many of the Greek writers, particularly the poets, together with their commentators. In the following year he happened to meet with an epitome of Buxtorf's Hebrew Grammar, which gave him the first idea of studying that language. Of the ardour with which he engaged in this pursuit, some idea may be formed from the following extract from his own note-book:—'If it had not been the reverse of fortune, I would study a little of Hebrew music. A short

time before I commenced to study Hebrew, I dreamed, and saw in my dream Johan. Buxtorfius singing Hebrew psalms to the harp; namely, as he sung psalms, he played the harp with his hands, and sang with his voice. He stood upon a mound opposite to my father's house.' On being asked by a friend how he could have known the language in which he sang if he had not then commenced the study of Hebrew, he replied that he knew very little of Hebrew when the dream occurred to him; that Buxtorf sung the twelfth chapter of the Psalms, the whole of which he himself repeated from memory; that the person who appeared to him, whoever he was, had a Hebrew book with points lying near him; and that his harp was a very large one, of the ancient Welsh description. All these learned acquisitions were made under most disadvantageous circumstances. He had few books, no teachers, and no examples or inducements to stimulate him. He seemed to labour by an instinctive impulse in this mental toil, while his circumstances demanded the labour of sawing timber, working in the fields, fishing, and other employments. His inaptitude for these brought down upon him the anger of his father, who, not content with remonstrances, had frequently recourse to blows whenever he found him pursuing his studies when he ought to have been at work. In 1804, he paid his first visit to Liverpool along with his father, where he made an acquisition of some Greek and Hebrew books; but unfortunately, on his voyage home, the vessel was driven ashore, and the greater part of his volumes were either lost or spoiled. To add to his distresses, the harsh treatment of his father now became such as obliged him to leave home, and become a wanderer in the world. One by one his favourite lexicons and grammars were obliged to be sold to procure him subsistence. When at Bangor, he had the good fortune to attract the notice of the bishop of that see, Dr Cleaves; and this prelate, perceiving that his acquisitions in languages were very uncommon for a person in his situation, provided him with decent clothing, gave him some books, and took him into his service by employing him in working in his garden. Here he remained for two months; but his listless inaptitude for any steady manual labour induced him to accept another invitation from a clergyman who resided in the Isle of Anglesey. He lived with Mr Williams at Treffors for half a year; but some ill-usage from the servants, or some whim of his own, appears to have rendered this hospitable roof intolerable to him; and at last he had a dream which decided him to quit. 'I dreamed,' says he, 'at Treffors, and I saw in my dream the head of Herod brought into the parlour, and the hair thereof bearing three colours mixed—namely, black, red, and the colour of brimstone burning; and I heard that the death of Herod was sadly lamented, wherefore his head was received with great veneration and honour. And I heard that Herod was beheaded in the battle against the *Galatai Allobroges*, when fighting against them at the head of one of the Roman armies; consequently my welfare was changed at Treffors!' Such was the lame conclusion at which the limited intellect of this extraordinary linguist arrived!

During his residence at Anglesey, Richard met with some French refugees, who supplied him with a grammar of their language, by the aid of which, and by their assistance, he acquired such a knowledge of it as enabled him to read and speak with a good accent. He subsequently acquired the Italian language, so as to converse in it with great fluency. On leaving Anglesey, he again made his way to Liverpool. Mr Roscoe thus describes his appearance:—'His person and dress at this time were extremely singular. To an immense shock of black hair he united a bushy beard of the same colour. His clothing consisted of several coarse and ragged vestments, the spaces between which were filled with books, surrounding him in successive layers, so that he was literally a walking library. These books all occupied their proper stations, being placed higher or lower according as their sizes suited the conforma-

tion of his body, so that he was acquainted with the situation of each, and could bring it out when wanted without difficulty. When introduced into a room, he had not the least idea of anything that surrounded him; and when he took his departure, he appeared to have forgotten the entrance. Absorbed in his studies, he had continually a book in his hand, to which he frequently referred, as if to communicate or receive information, and apparently under a conviction that every person he met with was as much interested as himself. His sight was imperfect, his voice sharp and dissonant, and, upon the whole, his appearance and manners grotesque in the highest degree. Yet under all these disadvantages, there was a gleam in his countenance which marked intelligence, and an unaffected simplicity in his behaviour which conciliated regard.

His friends in Liverpool endeavoured to procure him some suitable occupation; and, as a preliminary, consigned him to the care of a person, in order to accustom him to habits of cleanliness and regularity of conduct. He had not, however, been under this discipline more than half a year, when he became restless and tired of his situation. He was tried at his own trade of a wood-sawyer, and afterwards as a printer; but he had not the necessary abilities for either. With a small sum of money, and a collection of Arabic and Hebrew books, he once more returned to his father's house. As long as his money lasted, he was allowed to live in some degree of peace; but when it was gone, dissensions again arose; and after parting with some books, and one especially—a Hebrew Bible with points—which he sold with deep regret, he found his way again to Liverpool.

He now determined to undertake a journey to London, for the purpose of buying another Hebrew Bible, and at the same time of obtaining some instructions in the Chaldee and Syriac tongues. In the summer of 1807, Richard accordingly set out from Liverpool, furnished with a small knapsack on his back, a long pole in his hand, round which was rolled a map of the roads, and his few remaining books deposited in the various folds of his dress. This journey did not, however, answer the purpose intended; and what was still worse, he could neither find employment, nor obtain assistance by any means whatever. From London he made his way to Dover, probably not without some intention of making his way to the continent. Here fortune smiled upon him. He was engaged in sifting ashes in the king's dockyard, under the direction of the superintendent, who benevolently allowed him his breakfast every morning, furnished him with a chest to keep his books, and also paid him 2s. 4d. a-day as wages. From this time he was not only able to provide for his personal wants, but also to pay the Rabbi Nathan, a celebrated proficient in Hebrew, for instruction in that language. In this situation he continued for nearly three years, which seem to have been passed more happily than any other period of his life. During his stay at Dover he had another dream, which he thus noted down:—"Before my continual disappointments and troubles in learning, I dreamed, and saw myself in my dream upon the plain near the river of Babylon, where I saw the harps of the captives of Israel hung upon the willows, and I saw the willows grown to an exceeding great height, and the harps were hung upon them in the night, when being rainy weather." To illustrate this dream, he made a rude drawing of some half-a-dozen tall willows growing in a row, with a harp placed among the branches of each.

In 1810, Richard, perhaps stimulated by other dreams or constitutional restlessness, quitted Dover, and returned to London. He obtained an introduction to the Society for Promoting Christianity among the Jews. They appear to have paid some attention to him; but finding him perhaps useless for their purposes, he broke with them, and after suffering many privations, by the aid of some funds from the Welsh Bardic Society in London, he took his passage in a small vessel to Barmouth, whence he made his way to Bangor. For some time he

seems to have led a wandering and precarious life, with the exception of two or three years which he spent at Bagillt in Flintshire, where, being supplied by some kind individual with the necessities of life, he enjoyed a degree of ease and rest; still, however, intensely occupied in his philological studies, and amusing his leisure hours in blowing a ram's horn, with such loud and unharmonious blasts, as proved no inconsiderable nuisance to the neighbourhood. A handsome French horn having been presented to him, however, he threw aside the ruder one, and by constant practice, qualified himself to play a few tunes, not altogether devoid of some pretensions to harmony. On leaving Bagillt, for what reason is not known, he again took up his residence in Liverpool. 'Here,' says Mr Roscoe, writing in 1822, 'he may be seen at times walking with a book under his arm, without noticing or speaking to any one, unless he be first spoken to, when he answers in any language in which he is addressed with great readiness and civility; and it is remarkable that he never changes the language in which the conversation is begun, as long as any other person is inclined to continue it. If any gratuity be offered him, he receives it with a degree of hesitation, generally using the words, "I am not worthy." To any ridicule to which his dress and appearance may give rise, he is totally insensible. At one time he chose to tie up his hair with a large piece of green ferret, which gave him the most ludicrous appearance possible. Some time since one of his friends gave him a light horseman's jacket of blue and silver, which he immediately put on, and continued to wear, and which, contrasted with his hair and beard, gave him the appearance of a Jewish warrior, as represented in old prints, and consequently attracted after him a crowd of children. In his personal appearance he strongly resembles some of the beggars of Rembrandt; yet there is some expression of dignity in his countenance, which cannot be observed without a feeling of respect. A short time ago one of his friends gave him the frame of an old broken Welsh harp, which he repaired with greater ingenuity than might have been expected, and supplied it with strings. This he occasionally carries with him, and accompanies his repetition of some of the Psalms in the original in a manner not altogether displeasing. In his diet he is particularly frugal, or rather careless, drinking only water, or milk if it comes in his way. He is generally the master of a few shillings, which he husbands with infinite caution, taking care lest they should be totally expended, even if he should be compelled to sell some of his books for his immediate support. His religious opinions are not easy to ascertain, as he declines answering any direct questions of this kind; but that he entertains a deep reverence for the Supreme Being, sufficiently appears from his frequent extempore quotations from the Hebrew Scriptures, and by numerous extracts in Hebrew and Greek, and other languages, in his memorandum books. For some time he associated much with the Jews, and attended their synagogue, with a view of improving himself in Hebrew; but having given some offence, a quarrel took place between them, which he heightened with some sarcastic remarks on their ceremonies, that terminated their intercourse. His disposition is mild, and his general manner civil and respectful. He is remarkable for his adherence to truth on all occasions; nor is he addicted to any manner of vice. He exhibits also much liberality of character, as he frequently gives, or offers to give, books which he values very highly, either in return for any kindness shown him, or as a mark of his esteem and good-will. Even the works which he has compiled with great labour he feels no hesitation in parting with. In this respect he has truly described his own character in one of those scraps in which he frequently commits his thoughts to writing. "If any kindness or favour should be done to me by any person or persons, a friend or friends, &c. my will and natural inclination of my heart is to return the same also to them in virtue and good works, not by evil; and if I should be employed in any

laborious work, I would endeavour to do such a work according to the best of my abilities."

That Richard's literary acquirements extended only to the mere investigation of words, and the grammatical construction of languages, without comprehending the facts which he read, is illustrated by an interview which he had with a learned member of the university of Oxford. After the introduction, and the surprise occasioned by his appearance, he was asked whether he understood Latin and Greek; and having answered in the affirmative, he was desired to read a passage in Homer. Richard accordingly thrust his hand into his bosom, and diving down to the residence of the Greek poet, dragged him from his depths, opened the book, and read the first passage that occurred, commenting on the lines, as he proceeded, with many judicious critical remarks, showing, to the surprise of the gentleman, a thorough knowledge of the language. The following dialogue then took place:—

'Very well, Richard; you have translated this passage very well. Pray have you read the *Iliad*?'

'Yes I have.'

'And what do you think of the character of Andromache?'

(*After a pause.*) 'Andromache?'

'Yes; what do you think of the character of Andromache?'

(*After another pause.*) 'It is a *fight of men*.'

'Yes, yes; that is certainly the derivation of the name. But what do you think of Andromache, the wife of Hector?'

'I know nothing about that!'

After the gentleman had departed, Richard was asked how it happened that he could have been so stupid as not to give a more rational answer. To which he very unconcernedly replied, 'I thought he was asking me about the *word*, and not the *woman*.'

On another occasion he exhibited more rationality in his explanation of the manner in which he obtained his knowledge of languages. 'If it was any modern language,' said he, 'such as the Spanish, I would take a vocabulary of the language, and examine what words corresponded with or resembled the words in any other language with which I was acquainted—as, for instance, the Latin, French, or Italian—and these words I would strike out of the vocabulary, leaving only such as were the original or peculiar words of the Spanish tongue; and then, by the assistance of a grammar, I should soon be able to attain a knowledge of that language.'

The enthusiasm of this strange being for the acquisition of languages led him to an equally eager desire to communicate his acquirements to others. He was ever ready to teach, notwithstanding his many rebuffs and disappointments. He also employed himself in making laborious compilations for a Greek and English lexicon; a collection of Hebrew extracts, followed by a vocabulary in Hebrew and English; as also a lexicon in Hebrew, Greek, and English. Richard continued to live in Liverpool up to 1833; but we know not anything of his subsequent history.

THE BRITISH COLONIAL TRADE.

In a recent number we presented a series of, we hope, not uninteresting particulars respecting the foreign commerce of Great Britain. It was necessary in that article to take only a passing glance at the trade carried on with the colonies, intending to treat the subject more deliberately afterwards. We now attempt to do so.

The United Kingdom owns upwards of forty dependencies; but the greater part of these are little else than military or naval stations, and those entitled to be considered as countries suitable for a miscellaneous population are comparatively few in number. The principal colonies of this latter kind are Canada, Nova Scotia, and New Brunswick, the West India Islands, British Guiana, the Cape of Good Hope, the Mauritius,

Ceylon, and the Australian continent and islands, including New Zealand. Hindostan is also, in great part, a British settlement; but not being a crown colony, it stands in a peculiar relationship to the mother country.

Taking them altogether, the great question is continually obtruding itself—What is the use of these colonies to Britain—what does she make of them? The answer perhaps is, that they were acquired, and are sustained, at a great cost, for the sake of their trade. The next question, then, is—Have they realised our expectations in this respect—are they found to pay? The people of Great Britain are surely concerned in knowing the truth on such a subject: and this we propose to tell them. It is easy to estimate a foreign trade, the balance of which is simply the difference between the net imports and the net exports; but in the case of colonies, in addition to the usual charges, we have the expense of their protection and home management to place against the commerce. And this expense, be it observed, is not, so far as England is concerned, merely a part of the general expenditure defrayed in equal proportions by the whole body of the people. The colonies are not taxed. They contribute nothing, in a direct manner, to the revenue of the mother country, who defends them with her fleets and armies at her own proper charge. Sir Robert Peel's recommendation, in 1842, 'that colonies should, as far as possible, be treated as if they were integral parts of the kingdom,' is a mere rhetorical flourish; unless he would admit them to the right of sending home representatives to parliament—a plan which distance, and other circumstances, would render impracticable in most cases, and inconvenient in all.

The following is an outline of the colonial trade of Great Britain, made up in round figures from the returns for 1842:—From the Cape of Good Hope we receive wool, wine, hides, ivory, skins, aloes, &c. to the amount of L.280,000; remitting, on our part, L.369,000 in cotton, woollen and linen manufactures, apparel, earthenware, hardware, iron and steel, soap and candles, stationery, &c. On the western coast of Africa, where we have Sierra Leone, Gambia and Gold Coast, the exports are chiefly cotton goods, firearms, hardware, and salt; and the imports palm-oil, with some ivory, teakwood, wax, hides, dyewoods, &c.; the former amounting to L.132,000, and the latter to L.90,000.

From Mauritius, the imports are now almost wholly sugar, L.960,000; and its exports L.245,000 in cotton goods, linens, iron and steel, machinery, &c.

Ceylon supplies coffee, cinnamon, cocoa-nut oil, ivory, &c. L.1,012,000; and takes cotton goods, linens, woollens, earthenware, copper, hardware, iron and steel, &c. L.249,000.

From New South Wales and Van Diemen's Land, the principal import is wool—L.298,000 for the former, and L.134,000 for the latter; with the comparatively large export of our own manufactures of L.599,000 and L.261,000. Western and South Australia are as yet quite insignificant; and New Zealand purchases from us to the extent of only L.42,000.

The West Indies, with British Guiana and Honduras, remit chiefly in sugar, coffee, rum, cotton, pimento, molasses, mahogany, logwood, fustic, cocoa, cochineal, ginger, hides, &c. L.6,000,000; and purchase cotton stuffs, linens, woollens, apparel, &c. L.2,591,000. In commercial importance, they stand as follows:—Jamaica, British Guiana (Demerara, Essequibo, and Berbice), Honduras, Barbadoes, Trinidad, Antigua, St Vincent, St Kitts, Grenada, St Lucia, Dominica, Tobago, Bahamas, Montserrat, Bermudas, Tortola, and Anguilla.

The American colonies supply us with timber, wheat, ashes, furs, fish, turpentine, &c. L.1,391,000; and take woollens, cottons and linens, hardware, iron and steel, soap and candles, earthenware, apparel, &c. L.2,280,000. Of these sums, the Canadas have L.923,000 for imports, and L.1,589,000 for exports; the others standing thus in importance: Newfoundland with Prince Edward's Island, New Brunswick, and Nova Scotia with Cape Breton.

In the Mediterranean there are Gibraltar and Malta; from which we import L.40,000 and L.232,000, and to which we export L.938,000 and L.289,000 respectively.

If to these we add, as too unimportant for classification, the Falkland Islands, Hong Kong, and St Helena, we have a grand total of L.3,088,000 imports, and L.3,199,000 exports, forming the whole of the British colonial trade.

The expenditure by which we keep up these establishments was given as follows in an authoritative paper for 1836. We have not seen a more recent statement; but this, we presume, will afford a sufficiently correct idea of the cost, with the exception of one important item, to be mentioned presently.

	Total Expenditure incurred by Great Britain.
Gibraltar,	L.139,630
Malta,	110,818
Cape of Good Hope,	242,907
Mauritius,	78,284
Bermuda,	91,446
Fernando Po,	510
Ascension,	4,807
Heligoland,	1,016
Ionian Islands,	118,965
St Helena,	87,558
Jamaica, Bahamas, Honduras, Barbadoes, Grenada, St Vincent, Tobago, An- tigua, Montserrat, St Christopher's, Nevis, Anguilla, Virgin Islands, Dominica, St Lucia, Trinidad, British Guiana,	373,242
Lower Canada, Upper Canada, Nova Scotia, New Brunswick, Prince Edward's Island, Newfoundland,	221,441
Sierra Leone, Gambia,	161,294
Ceylon,	38,347
Western Australia,	133,808
New South Wales, Van Diemen's Land,	12,745
General charges,	533,501
	23,449
Total, omitting fractions,	L.2,806,483

The item alluded to as an exception to the correctness of the above account, is the sum of L.221,441, set down for the Canadas. On this point McCulloch says in his newly published work—'Our ascendancy in Canada, at this moment, is wholly dependent on the presence of a large military force, occasioning, one way and another, a direct outlay of little less than L.1,500,000 a year; and all this heavy expense is incurred without any equivalent advantage, and with a full conviction on the mind of every man of sense in the empire that, at no very distant period, Canada will be independent, or an integral portion of the United States!' To all this may be added upwards of L.20,000 for the expense of the colonial office at home; and thus we see that the expense of keeping up our colonies is greater—not than the mere profits—but than the entire gross amount of the colonial trade, by more than L.900,000 a year! Let it, in short, be distinctly understood that, in order to do business to the extent of *three millions annually*, we spend pretty nearly *four millions annually*. To save money and trouble, would it not be better to pension every colonial merchant to the extent of his profits, and devote the remainder of the four millions to some useful purpose? What a splendid system of national education could be supported for two millions annually!

Some persons answer that the use of colonies is *passive*: that we must retain them in our own hands, even at the enormous sum they actually cost, in order to prevent their getting into the hands of other nations. If this notion has reference to trade, it is, considering the plain and obvious facts of experience, nothing less than absurd. By the United States, since they acquired their independence, we have been prodigious gainers; and how the extension of a territory so profitable to us—supposing this to take place through the manumission of our North American colonies—can be reckoned injurious, it is difficult to imagine. But if we are determined, by *political jealousy* (no doubt the true reason), to prevent the States from extending their available line of coast, this would be quite as well accomplished by

the conditions of that treaty which should give national freedom to our colonies, exchange the bonds of force for those of gratitude, and render Great Britain no more the rival or the mistress, but the friend and ally, of the new world. As for the advantage of such establishments with reference to our shipping and seamen, which has been so much insisted upon by the press, this will vanish, as a matter of course, with the repeal of the navigation laws. There can be no real freedom of commerce while a single shackle remains on the carrying trade; and it is impossible to conceive why the ships of Great Britain should not take the same chance as her manufactures.

To come to the point, however: colonies are, in our opinion, neither commercially nor politically useful; they are simply the means appointed by nature, and unconsciously adopted by mankind from the beginning of time, for peopling the desert places of the earth, by offshoots from countries where the population has increased so far as to draw too heavily upon the sources of subsistence or comfort. It has been the destiny of our island to accomplish more in this way than any other nation, ancient or modern. To say nothing of our military and maritime stations, which dot the globe throughout, a great part of the new world is already English, and the germs of English empires are now planted round the coasts of a still newer world in the vast expanse of ocean between India and America. But the misfortune is, that we have never been satisfied with this legitimate exercise of our energies; indeed we have never given ourselves to the task but by fits and starts, as if colonisation was not one of the great and regular duties of government in an old and crowded country, but merely a casual necessity imposed by temporary circumstances. On the other hand, when the true objects of the colony are accomplished; when our offspring has grown old in turn, and comes, in the common course of nature, to have duties and interests of its own apart from ours; when, in fact, it is no longer a source of convenience and comfort, but of anxiety and weakness—then do we cling to it with an insane pertinacity which can only be loosened by blood!

It would be difficult to say whether our follies of omission or commission in this respect are the more remarkable; but, in point of fact, our whole colonial system—if a tissue of puerile crotchets, wrought out by petty expedients, can be called a system at all—is quite unworthy of the age and the nation. The splendid countries which have fallen into such incapable hands, have advanced, in those few cases in which any real advance has been made, in spite of us; but, generally speaking, they present an unbroken aspect of ruin and desolation.

But let us not be understood to blame the government exclusively, in a case in which the people are likewise only too obviously in fault. In fact, we do not know that in England a minister could hold his place for a month who appeared willing to abandon even a useless colony! 'Ships, colonies, and commerce,' are inseparably associated in the national mind; and he who attempts to sever them, is looked upon as a parricide, who would destroy, if he could, our trade and our very maritime existence. This is an instance of the constancy which is real inconsistency; for the foundation of our faith in colonies has crumbled away before our eyes, leaving behind only an empty prestige. Our colonies were *ours*, in the closest and most selfish meaning of the expression; hence the exorbitant value we attached to them. They were snug little farms, cultivated for our own supply, and the wages of the labourers paid upon the *truck* system. But all would not do. It was in vain that we mulcted ourselves to keep up these pet establishments. We were at length tired of eating dearer sugar than we could purchase in the general market, and of circumscribing the sale of our manufactures to avoid dealing with other people; and what is more, we found that the monopoly worked in quite another way

than we supposed, being injurious to colony and mother country alike. Year after year our colonies are ceasing more and more to be *ours*, in the meaning we once attached to the expression; yet we do not regard them the less fondly, or cling to them the less frantically. We repeat, that it is not the executive who are to be blamed for maintaining these expensive toys. The people are the party in fault. If the whistle must be had, it must be paid for.

Is it, then, our wish to dissolve the existing attachment between England and her colonies? Far from it. It is the duty and the fate of this great country to colonise; but in doing so, she should proceed according to reason, instead of following, as heretofore, a blind instinct. The real use of a colony is to absorb the excess of population at home; and the real use of a colonial minister is to conduct this great object in a manner which will benefit alike the new and the old country. As things are conducted at present, our splendid possessions in Canada—to say nothing of the glaring mismanagement at a greater distance—are a mere emigration highway into the United States. The emigrant, of all men in this world, is the most dependent upon certainty in his pecuniary calculations; but this is altogether out of the question in the former country. In the States, where there is a fixed price, land is bought like any other commodity, and the intending purchaser knows what he is about, and can take his measures accordingly; but in Canada, when he has made his selection, the lot is put up to auction, and after all his trouble, expense, and anxiety, may be sold over his head! In fact the constant failures of our emigration system betray a want, not only of great talents, but of the most ordinary capacity; and we bring forward the above details with the view of inducing the people to be satisfied no longer with debating on minor points, but to proceed, from the groundwork thus laid down, and seriously inquire into the whole question.

We must not conclude, however, without suggesting that, in an examination of the system, it will be proper to discriminate between colonial settlements and political points *d'appui*. We have included, for instance, the expenses of Gibraltar, Malta, Heligoland, &c. in the general account, because we have likewise stated the amount of the trade carried on through them; but the importance of such stations is in a great measure irrespective of commerce, and must be estimated by other rules than those of arithmetic.

TRUTH AND HONESTY.

A LESSON FOR LITTLE BOYS.

A REVOLUTION of opinions is taking place in the present day; sectarian and national prejudices are giving way to a holy feeling of universal brotherhood; military conquests are robbed of their tinsel, and appear in their native deformity; and moral dignity, though discovered amid poverty and ignorance, is raised to its legitimate place, exciting the respect and admiration of all capable of estimating true worth. This latter remark will plead an apology for introducing to the reader a young hero, filling a station no higher than that of a pupil in a parochial school.

Two boys, of nearly the same age, were one day amusing themselves with that dangerous, though not uncommon pastime, pelting each other with stones. They had chosen one of the squares for their playground, thinking by this means to avoid doing mischief. To the consternation of the thrower, however, a missile, instead of resting on the shoulders of the boy at whom it was aimed, entered the library window of one of the lordly mansions forming the quadrangle.

'Why don't you take to your heels, you blockhead? you will have the police after you whilst you are standing staring there,' was the exclamation of his companion, as he caught him by the arm in order to drag him from the spot. The author of the mischief still retained his thoughtful position.

'If your father is obliged to pay for this, you will stand a chance of having a good thrashing, Jack,' the other boy urged.

'Never mind, Tom; leave me to myself,' was the reply; and the young delinquent moved, with unflinching step, towards the door of the mansion, the knocker of which he unhesitatingly raised. The summons was answered by a footman.

'Is the master of the house at home?' he with some diffidence inquired.

'He is.'

'Then I wish to see him, if you please.'

'That you can't do, my man; but I'll deliver any message for you.'

'No, that will not do. I must—indeed I must see the gentleman himself.' The earnestness and perseverance of the boy at length induced the man to comply with his request, and opening the door of the library, he apologised for asking his master to see a shabby little fellow; adding, that he could neither learn his business nor get rid of him.

'Bring him in,' said the gentleman addressed, who, having witnessed the transaction, and overheard the conversation, was curious to know the object of the boy's visit. The poor child, whose ideas had never soared above his father's second floor, stood for several moments in stupefied amazement when ushered into an elegant apartment; but remembering the painful circumstance which had brought him into this scene of enchantment, he in some measure regained his self-possession.

'I am very sorry, sir,' he began in a faltering voice, 'but I have broken your window. My father is out of work just now, and cannot pay for it; but if you will be kind enough to take the money a little at a time, as I can get it, I will be sure to make it up; and as he spoke, he drew a few halfpence from his pocket and laid them on the table.

'That's an honest speech, my lad; but how am I to be sure that you will fulfil your engagement?' Mr Cavendish returned. 'Do you know that I could have you sent to the station-house till the money is made up?'

'Oh don't send me there, sir; it would break my dear mother's heart! I will pay you up—all—indeed I will, sir; and the poor boy burst into a flood of tears.

'I am glad that you have so much consideration for your mother's feelings; and for *her* sake, I will trust to your honesty.'

'Oh thank you, sir—thank you!'

'But when do you expect to be able to make me another payment? This is a very small sum towards the price of a large square of plate glass;' and as he spoke, he glanced at the four halfpence which the boy had spread out.

'This day week, sir, if you please.'

'Very well, let it be so. At this hour I shall be at home to see you.' Poor Jack made his very best bow, and retired.

True to his appointment, our high-principled boy appeared at the door of Mr Cavendish's mansion. As the footman had previously received orders to admit him, he was immediately shown into the library.

'I have a shilling for you to-day, sir!' he said exultingly, and his countenance was radiant with smiles.

'Indeed! That is a large sum for a boy like you to obtain in so short a time. I hope you came by it honestly?' A flush of crimson mounted to the cheek of poor Jack, but it was not the flush of shame.

'I earned every penny of it, sir, excepting one my mother gave me, to make it up,' he energetically replied; and he proceeded to say that he had been on the look-out for jobs all week; that he had held a horse for one gentleman, and had run on an errand for another; in this way accounting for elevenpence.

'Your industry and perseverance do you credit, my lad,' Mr Cavendish exclaimed, his benevolent countenance lighting up with a smile. 'And now I should like to know your name and place of residence.'

'I will write it, sir, if you please. Indeed I brought a piece of paper for the purpose of putting down the money. I hope I shall be able to make it all up in a few weeks, for I am trying to get a situation as errand-boy.'

'You can write then? Do you go to school?'

'Oh yes, sir. I go to a free school.' And Jack stepped forward to take the pen, which Mr Cavendish held towards him.

'You write a tolerably good hand, my little man. You may, I think, do better than take an errand-boy's place. Let me see if you have any knowledge of arithmetic.' Jack stood boldly up, and unhesitatingly replied to the various

questions which were put to him. 'That will do, my good boy. Now, when do you think you will be able to come and bring me some more money?'

'I will come again this time next week, if I'm alive and well, sir.'

'That was wisely added, my lad; for our lives are not in our own keeping. This, I see, you have been taught.'

Another week passed, and again Jack appeared, but his countenance now wore an aspect of sadness.

'I am very sorry, sir,' he said, 'I have been unfortunate, and have only a small sum to give you.' And as he spoke, he laid three pennyworth of halfpence before Mr Cavendish. 'I assure you, sir,' he earnestly added, 'I have offered my services to every gentleman on horseback that I could see.'

'I believe you, my boy: I am pleased with your honest intentions. Perhaps you will meet with better success another time. Let me see; you have now paid one shilling and fivepence: that is not amiss for the time; and with an encouraging smile Mr Cavendish suffered him to depart.

Though Mr Cavendish had, from the first, concealed his intentions, his heart was planning a work of benevolence, which was nothing less than to befriend the poor boy, whose noble conduct had won his admiration. For this end he, a few days subsequently, paid the parents a visit when he knew that the son would be at school. He related the incident which had brought him under his notice, and proceeded to ask whether his conduct towards themselves was equally praiseworthy.

'Oh yes, sir,' exclaimed the mother, her eyes filling with tears. 'He has ever been a dutiful child to us, and always acts in this honest, straightforward manner.'

'He has indeed a noble spirit, sir,' the father rejoined; 'and I am as proud of him as if he were a prince.'

'Would you part from him?' Mr Cavendish asked. 'I have something in view for his future benefit.'

'Undoubtedly we would, for his benefit,' was the reply of both.

'Well, then, purchase him a new suit of apparel with these two guineas, and bring him to my residence this day week. I will then acquaint you with my views for him for the future.'

Language cannot describe the heartfelt gratitude which beamed in the eyes of the happy parents, nor could they find words to give it utterance.

When next our young hero came into the presence of his benefactor, his appearance was certainly altered for the better, though no disadvantages of dress could rob his noble countenance of its lofty expression. Mr Cavendish had previously made arrangements for him to become an inmate of his own house, and had also entered his name as a pupil in a neighbouring school. John Williams is now receiving a liberal education, and enjoying all the advantages which wealth can procure. Such a sudden change of position and prospects would, in many instances, prove injurious to the moral character; but with a mind based upon the solid principles which our young friend possesses, little fear may be entertained that such will be the result.

The above little sketch is authentic in every respect, excepting the names of the parties concerned. The events occurred a few months ago, and are here made public, with the hope that the truth and honesty, and judicious benevolence exhibited, may stimulate others to 'go and do likewise.'

COMPARATIVE STATISTICS OF PAUPERISM.

A paper delivered with the votes on the 9th of April, presents us with some comparative statistics of pauperism in the three kingdoms, which are at this moment of practical interest:—**ENGLAND**—Population in 1841, 15,906,741; annual value of property rated to the poor rates (return of 1841), L.62,640,039; expenditure for the relief of the poor (1844-45), L.5,039,703; rate per pound on value of property, 1s. 7½d.; total number of paupers relieved, including casual poor, 1,470,970; proportion per cent. to population, 9·2; rate of expenditure per head on paupers relieved, L.3. 8s. 6½d. **SCOTLAND**—Population in 1841, 2,620,184; annual value of property rated to the poor rates (return of 1843), L.9,320,784; expenditure for the relief of the poor (1844-45), L.292,685; rate per pound on value of property, 7½d.; total number of paupers relieved, including casual poor, 96,326; proportion per cent. to population, 3·7; rate of expenditure per head on paupers relieved, L.3. 0s. 9½d.

IRELAND—Population in 1841, 8,175,125; annual value of property rated to the poor (return of 1845), L.13,204,234; expenditure for the relief of the poor (1844-45), L.298,813; rate per pound on value of property, 5½d.—this calculation is made on the annual value of 113 unions, or L.12,305,784; total number of paupers returned, including casual poor, 125,774; proportion per cent. to population, 1·5; rate of expenditure per head on paupers relieved, L.2. 7s. 9½d.—*Caledonian Mercury*, 15th April 1847.

THE MOTHER'S CALL.

[THE smaller poems and songs of Allan Cunningham have very properly been presented by his son, in a small volume calculated for wide circulation. (Murray, London.) The editor accompanies the collection with an account of the manner in which Allan first came before the world as an author. Finding an English stranger roaming through Dumfriesshire in quest of ancient ballads and songs, the young poet imposed his own compositions upon him, and thus they were published as antiques. From peculiar habits of feeling, we never have been able to look on this proceeding *quâ* in the sportive light in which it is usually regarded; but, at the worst, it was no heavy subtraction from the really estimable character of Cunningham, while of the merit of the poetry concerned in the case there can be no manner of doubt.

The best of 'honest Allan' is here. His strength lay in his *Bonnie Lady Anne*, his *Hame name*, *Carriale Yett*, &c. and in his short poems. For greater literary efforts his defective education, and want of due intellectual discipline, not to speak of heavy worldly duties, unfitted him. It was early in life that he wrote the bulk of the present volume, which, being mainly the expression of a glowing youthful mind, is best fitted to give pleasure to minds at the same stage and in the same condition. With such minds, however, it should be a bosom book.

The following poem is a specimen of the English verses of Cunningham.]

COME, sweet ones, come to the fields with me,
I hear the hum of the honey bee,
I hear the call of the gray cuckoo,
I hear the note of the shrill curlew;
I hear the cry of the hunting hawk,
The sound of the dove in our 'customed walk,
The song of the lark, the tongue of the rill,
The shepherds' shout on the pasture hill.

My sweet ones, all come forth and play,
The air is balm, and I smell new hay;
Come, breathe of the flowers, and see how neat
The milkmaid trips on her scented feet;
Young folks come forth all joy, and run
Abroad as bright as beams of the sun;
Old men step out with a sadder grace,
And matrons come with a graver pace.

The smoke streams up, and the air is rife
With joy, and all is light and life;
From east to west there's not a stain
In all the sky, and the birds are fain,
And the beasts are glad, while man in song
Breaks out, for rain has larded long,
And earth has drunk more than her need
To fill her flowers and nurse her seed.

Now, now ye come, my little ones all,
As the young doves come at their mothers' call;
One run to yon tall foxglove, and see
At his breakfast of balm the golden bee;
Another go hunt from bud to bloom
The worm that flies with a painted plume,
Or see the doe solicitous lead
Her twin fawns forth to the odoriferous mead,
Or mark the nestlings newly fawn,
With their tender wings and their crests of down.

But stay, my children. Ere ye run,
Who made the sky and yon glorious sun?
Who framed the earth, and strewed it sweet
With flowers, and set it 'neath mankind's feet?
'Twas **OWN** in heaven. Kneel down, and lay
Your white foreheads to the grass, and pray;
And render **HIM** praise, and seek to be
Pure, good, and modest—then come with me.

THE HIGH AND THE HUMBLE.

THE grand outcry of the present day is for an improvement of the condition of the humbler classes—improvement in their homes, their gains, their social position, everything concerning them. It is well there should be a straining to this end—let it have free way in every legitimate channel. Let us guard, however, against every mode of propelling this cause which seems likely, by raising bad feeling between class and class, or by exciting an over-impatient discontent, to retard the safe and sure progress which it is actually making. Occasionally we find views propounded on the subject which seem to us of this obstructive kind; they would represent the present position of the labouring class as unusually degraded, and the amount of wretchedness at the base of society as unprecedented; they would mark capital as the enemy of labour, and fix a kind of stigma upon every well-replenished pocket, as if there were a criminality on the part of the rich in the fact of any other persons being poor.

Our tendency to poetise the past is perhaps the chief cause of the error in comparing the former and present condition of the labouring orders. Reposing on the old phrase *Merry England*, and dwelling on the sports and holidays of past times, we imagine that the lot of the ancient English peasant was one of uninterrupted sunshine and merriment, as if the earth had then yielded her fruits almost spontaneously. When we consult the actual documents of the past, something very different appears. For example, as to the amount of labour expected from a farm-servant, take the simple unvarnished account presented by Gervase Markham in his *Farewell to Husbandry*, dated 1653. It refers to the season immediately following Christmas, when of course there is no daylight till eight o'clock. 'At this time the ploughman shall rise before four o'clock in the morning, and after thanks given to God for his rest, and the success of his labours, he shall go into his stable, and first he shall fodder his cattle; then he shall curry his horses, rub them with cloths and wisps, and make both them and the stable as clean as may be; then he shall water both his oxen and horses, and housing them again, give them more fodder, and to his horse by all means provender, as chaff and dry peas or beans, or oats. And whilst they are eating their meat, he shall prepare his plough-gear, and to these labours I will also allow full two hours—that is, from four o'clock till six; then shall he come in to breakfast, and to that I allow him half an hour, and then another half hour to the gearing and yoking of his cattle, so that at seven o'clock he may set forward to his labour; and then he shall plough from seven o'clock in the morning till betwixt two and three in the afternoon; then he shall unyoke and bring home his cattle, and having

rubbed and dressed them, he shall give them meat; then shall the servants go in to their dinner, which allowed half an hour, it will then be towards four o'clock, at which time he shall go to his cattle again, and give them more fodder; which done, he shall go into the barns, and provide and make ready fodder of all kinds for the next day. This being done, and carried into the stable, ox-house, or other convenient place, he shall then go water his cattle, and give them more meat, and to his horse provender, as before showed; and by this time it will draw past six o'clock, at what time he shall come in to supper; and after supper, he shall either by the fireside mend shoes, both for himself and their family, or beat and knock hemp or flax, or pick and stamp apples or crabs for cider or verjuice, or else grind malt on the querns, pick candle rushes, or do some husbandly office within doors till it be full eight o'clock. Then shall he take his lantern and candle, and go see his cattle, and having cleansed and littered them down, look that they be safely tied, and then give them food for all night; then giving God thanks for benefits received that day, let him and the whole household go to their rest till the next morning.'

Here, it will be observed, is sixteen hours' work, abated only by three half-hours or so for meals—surely no improvement upon the peasant's lot in our own times!

With regard to the food of farm-labourers in those days, Tusser in his *Points of Good Husbandry* speaks of an abundance of fish and flesh, chiefly salted; but we know from Markham that oats were then the bread of the English peasantry, as they continued to be in the early part of the last century. Tusser, too, says expressly, 'Give servants no dainties.' Food is, however, the point in which past times show best in contrast with the present.

As to the social condition of the peasantry, and the treatment they received from their employers, we believe that great misapprehension prevails. It is supposed, because the working-man sat in the same apartment, and ate at the same table with his master, that he was his friend and companion. There could not be a greater mistake. The presence of the master was a constant restraint on the servant. A severe discipline was kept up. Tusser says, 'Keep servants in awe,' and elsewhere adds—

'No servant at table use * sauc'ly to talk,
Lest tongue set at large out of measure do walk.'

Nay, it appears from this quaint author that beating was a recognised piece of discipline with the housewife in the management of her servants. A maid that beats her clothes in washing, deserves, he says, to be beat

* That is, accustom or permit.

herself. 'Make maid to be cleanly, or make her cry creak; that is, make her run into a corner for safety. And, as a general advice,

'A wand in thy hand, though ye fight not at all,
Makes youth to their business better to fall.'

Where corporal punishment existed, there could of course be no real sense of equality, nor, one would suppose, any great amount of good feeling, between the parties.

The admirers of the past also overlook the actual degradations which attended the system of a common table in old times. In a gentleman's house, the salt-vat indicated the point where gentility ended and servility began; a distinction which would now be pronounced odious and intolerable by both parties. Nor was the fare uniform. Fynes Morison, who travelled in Elizabeth's time, tells us of his being present at the table of a Scottish knight, where the servants had porridge with a bit of sodden meat, while the gentlefolk ate pullet broth with prunes. More lately, Lord Lovat assigned different beverages to his different classes of retainers—wine to himself and immediate friends, ale to his troop of Highland cousins, beer or water to the common men. Is it not simply a reform in point of taste, that, if the different classes are to fare differently, they should each enjoy it apart, so as at least to shut out the view of those comparisons which are justly said to be odious?

Past misdeeds, it is said, are easily forgotten. Thus it is, perhaps, that we lose sight of the vast extent of popular misery which every now and then attracted attention in former times, as it does now. 'The poor you shall have with you always,' was pronounced nearly two thousand years ago. To keep, however, nearer our own time—hear how Jeremy Taylor described the sufferings of the many in what are thought to be the better days of England. 'If we could,' says he, 'from one of the battlements of heaven spy how many men and women at this time lie fainting and dying for want of bread, how many young men are hewn down by the sword of war, how many poor orphans are now weeping over the graves of their father, by whose life they were enabled to eat; if we could but hear how many mariners and passengers are at this present in a storm, and shriek out because their keel dashes against a rock, or bulges under them; how many people there are that weep with want, and are mad with oppression, or are desperate by too quick a sense of constant infelicity—in all reason we should be glad to be out of the noise and participation of so many evils! This is a place of sorrows and tears, of great evils, and a constant calamity,' &c. Certainly, whatever be the present condition of the agricultural labourers of England, it is no falling off from the past. Arthur Young, the Rev. Mr Howlett, and the Rev. Dr Davies, who wrote about this class at various times during the latter half of the last century, invariably describe their condition as one of great wretchedness. Arthur Young considered it as inferior to that of the Irish peasant. Stephen Duck, the poet, tells us that he worked at threshing in Wiltshire, about 1730, at 3s. a-week. In former times, there were not those masses of wretched people in the large towns which form so appalling a feature of our time; but this does not imply that the wretched were then fewer in proportion to the population. We forget, when we hear of the miserable huddings of the poor in the Cowgate of Edinburgh, the wynds of Glasgow, the cellars of Liverpool, the rookeries of London, that for thirty years past vagrancy has been everywhere sternly put down. The poor are only driven off the roads and out of the country into the large towns, which, in such circumstances, have become their sole refuge. At the beginning of the last century, the vagrants of Scotland alone were estimated at a hundred thousand, or about a twelfth of the whole people. About 1770, they continued to be so numerous, that a relative of the present writer, who occupied a large pastoral farm on Tweedside, seldom passed a night without having to entertain half-a-dozen beggars, wool-gatherers, wandering idiots, and other misera-

bles on Sunday he has often had from twenty to thirty quartered in his outhouses. Now, it was perhaps better for the poor to wander about the country than to be pent up in the darkest recesses of our large cities; but still it is only an evil shifted in its locality—it is not one generated of new. We may also remind the reader that, about fifty years ago, so pressing were the hardships of the rural labourers of England, that the legislature was compelled to adopt the Allowance System; that is, to make them partially the stipendiaries of the public, which they continued to be till 1834.

One of the most telling charges against our present social state is, that it embraces such violent inequalities—some excessively rich, some excessively poor, as if the good things of fortune underwent a kind of polarisation. And yet there is no country where so vast or so affluent a middle class fills up the space between the opposite poles—where, indeed, the gradation of conditions is so nicely shaded; neither is there anywhere such free and frequent movement from one step in the scale to another. The middle class, with its wealth and its comforts, is a body mainly composed of the children of the classes below it—promoted in consequence of industry, enterprise, and general merit. The higher class, again, is continually recruited from the middle one. Even in the classes below the latter, there is a continual movement upward, the child of the unskilled labourer becoming the ingenious well-paid artisan of the next age. Many transitions there are even more startling; and certainly it is not uncommon to see men in the high position of legislators, whose fathers were poor men all their days.

But the high, it is said, are now divided from the humble, and keep them at a distance, which was not the case in former times. We have shown that much fallacy exists regarding the associations of the rich with the poor in past ages. It was attended by distinctions which would have made their separation preferable. As far as *local residence* is concerned, there is a greater division than there was. The advance of taste in their habits of life has also placed the rich *personally* more apart from the poor than they once were. In these respects the alleged separation is a truth. As far as real feeling on the part of the rich towards the poor, and actual exertion of benevolence in their behalf, are concerned, we believe the allegation to be the reverse of the truth. The fact is, that, till the present time, the state of the humbler classes was little regarded at all by the affluent. Howlett, Davies, Eden, and a few others, wrote on this subject to a languid public. At an earlier period, the subject had no place in literature, and hence, we may infer, none in public regard. How different is the case at the present day, when philanthropists, legislators, and great societies formed from the miscellaneous public, are giving the most earnest attention to the subject! Nor is the movement confined to speculation. The positive beneficences of the present generation of the upper and middle classes put all past experience to shame. Even that personal attention to the wants of the poor which is attributed to past times, may be said to have undergone only this change in the present day—that the duty is mainly in the hands of clergymen, missionaries, directors of sick societies, leisurely ladies, and other individuals; a change implying only an allocation of the labour, not its cessation. A busy merchant does not go much among the poor himself, but he subscribes liberally to those who have time to do so. A country gentleman sees, perhaps, little of the insides of his cottagers' houses, but his wife and daughters are continually visiting them, and they furthermore maintain a school in the village, and even in some instances become its teachers. The humbler classes are often spoken of as everywhere neglected, if not oppressed, by the rich; whereas, in reality, the succour of the poor, and their moral and physical improvement, are about the most engrossing subjects of thought and of exertion in our day.

All these things considered, we would describe the present state and prospects of the humbler portion of the community in a different manner from the writers alluded to. There is much to be deplored, much to find fault with; but there never was less, and agencies are now at work for making it less than ever. But the improvement of the condition of the unendowed will only be advanced by a harmonious exertion on the part of society at large. It will not be favoured by unjust estimates of the existing circumstances of the humbler classes, or by unfounded accusations against their superiors. Neither will it be promoted by that kind of philosophy, so predominant in the present day, by which everybody is excused from the responsibility of his own fate, and the burden thrown on something or somebody else. We all owe a duty to each other in the social world, as has often been affirmed in our pages; and if this be neglected, as it often is, great evils will be the consequence. But there is some limit to this principle, and the views entertained about it by some writers are of a fatal kind. We would take leave to insist on the impolicy of the doctrine which makes out every person in humble circumstances to be an ill-used man, for whom *something should be done!* A man in humble circumstances is but too apt to despair of any efforts of his own for his own benefit—too readily does he incline to look for aid from external sources. To lead him, therefore, to think that he has no charge over himself, since others are to see after him—that he need deny himself nothing, since it is somebody else's conduct which makes him what he is—can only give him a deeper position in the mire. The middle classes, moreover, having for the most part risen by their own efforts, are repelled when they hear such doctrines propounded, and their aid is lost. Better to let the industrious orders understand that, with all the good-will in the world, the other classes can only help a little in the good work, and that even this help can only be of any avail if the parties proposed to be benefited exercise such vigilance and energy as nature and circumstances have placed in their power. Blessings only come when they are sought—Heaven only helps those who help themselves—and it seems equally a law that those only shall receive any advantage from the kindly benevolence of their fellow-creatures, who seek to come to the same results by well-directed efforts of their own.

THE MATIN BELL.

A TRADITION OF PORTUGAL.

THERE were great rejoicings in the city of Lisbon when Denis of Portugal, the warrior and poet king, celebrated his nuptials with the young and lovely Infanta of Castile. The monarch's popularity was at its height; the multitude, who had already conferred on him the title of 'Father of his People,' were roused to the most enthusiastic loyalty by the feasts and largesses bestowed on them; and the nobles, whose national pride was gratified by the alliance, found an additional source of satisfaction in their young sovereign's prudent dismissal of the queen's train of Castilian attendants, which prevented the possible influence of foreign favourites—over one whose beauty and grace rendered it more than probable that she would become their 'ruler's ruler.' At the queen's request, however, a young page, whose insignificance appeared to make his presence or absence of little moment, was retained.

With all external circumstances thus conducing to happiness (for her royal husband was as courteous and accomplished as he was brave and politic), Isabella of Castile had just cause to rejoice in her brilliant destiny; and during the first two months of her residence in her new home, not a shade obscured its brightness. At the expiration of that period, however, her quick perception detected the one infirmity of Denis's otherwise noble

nature. He was most painfully jealous. He could endure no rival in her thoughts, not even the natural and pious love of her kindred and her country. A cloud ever rested on his brow when she spoke to him of Castile, of her parents, of her youngest and favourite brother; nay, when, with the candour of her nature, she told him of her regret at parting from the friends and associations of her childhood, he had answered her with harshness. Isabella was very young, and very timid. From that moment she avoided all mention of her family and her native land; but, by a natural consequence, they obtained a stronger hold on her memory and her affections. Fear of awaking her husband's displeasure, on the queen's side, and a jealous doubt on that of the king, that the marriage of policy had not given him the love he craved, produced a constraint in their intercourse which was painful to both; and Isabella, chilled by the want of sympathy with her feelings in all around her, sought it at length in her young countryman, the page Gonzales. He could talk to her of dear and distant Castile; he could sing the songs doubly sweet now to her ear from their association with the past. Whenever the young queen sat alone with her ladies at their embroidery, the Castilian was summoned to beguile the time with his guitar, or with reminiscences of his royal lady's childhood; and this imprudent and somewhat undignified intercourse between the queen and her attendant was partially excusable, from the fact that Gonzales was the son of a noble Castilian lady, to whom the care of her own youth had been confided. He had been reared from infancy in her father's palace, and shared her own and her brothers' pastimes. And then Gonzales was so unlike the generality of pages! He was so gentle, so pious, so refined and humble in manner, that he found favour in the eyes of even the gravest and most prudish of the ladies of honour. He was of a slight delicate figure; and though very handsome, it was less the beauty of feature than of expression, which won the admiration, and even the affection, of those who gazed on his calm, thoughtful eyes and open brow. People in this evil world cannot, however, be more than ordinarily excellent, or more than usually beloved, without incurring envy; and the gentle virtues of Gonzales were not likely to make him popular with his wild young comrades, the pages of the palace. The greater number came to the conclusion that his true vocation was the cloister, and suffered him to pursue his own course with a contemptuous pity; but one, who was far beyond them in intellect and forethought, and whose future fortunes depended almost wholly upon the royal favour, beheld with all the bitterness of an envious and vindictive nature the Castilian page.

Bernardo di Silva had sought with unwearied diligence the notice of his queenly mistress. She was devout: he became most earnest in his attention to her confessor; in his attendance at mass. His conduct was exemplary, his services performed with grace and never-failing care. Nevertheless he failed in his design: nature had not bestowed on him the power of winning love. He gained but a cold approval—the homage paid to the semblance of virtue—no more.

No marvel, therefore, that he hated Gonzales, and, with the inconsistency of our nature, looked on his unconscious rival as his enemy—as one who stole from him the favour of his queen. Of a more vindictive spirit than even the generality of his countrymen, he mentally resolved to avenge what he considered his wrongs on the young Spaniard; and the opportunity came at last. When is there ever an occasion wanting to do evil?

It was a bright autumnal morning; the Tagus glittered like liquid silver in the dazzling sunbeams, as Bernardo stood gazing on its waters from the window of the queen's antechamber. It was a scene to gladden the heart, and raise the thoughts in devout gratitude to the Giver of the sunshine and the sweet air; but no joy, no peace was expressed on that young countenance, dark with unhallowed passions. He saw not the dancing stream, the clear and cloudless sky; he heard not the music of the far-off lark, nor the glad voices of the boatmen: his mind dwelt only on the scene within the inner chamber which he had just witnessed—the queen and her ladies listening with approving smiles to Gonzales, as he sang to them a lay of his native Castile. And very sweetly came the voice and guitar of the page on his ear at that moment, as he sang one of the fine old ballads of the Moors; but the sweet tones were discord to the diseased mind of the listener. He was still wrapt in his 'web of bitter fancies,' when a hand was laid on his shoulder, and turning with a start, he beheld the king, whom he had believed absent at the chase, standing beside him. Stammering an apology for not having seen the sovereign enter, Bernardo moved forward to open the door of the queen's chamber; but Denis detained him, and in a low voice bade him follow him into the adjoining corridor.

'Who sings in the queen's apartment?' was the king's instant question as they gained it.

'Her Grace's Castilian page, sire.'

'Does he often beguile her royal leisure in this minstrel fashion?'

'Ay, sire; whenever it pleases your majesty to hunt or ride abroad without the queen.'

'Ha!' exclaimed the king with a frown; 'what sayest thou?'

Bernardo's quick eye marked that frown, and he saw at once the feasibility of the plan which had come to his thoughts, like a very inspiration of evil. He paused in affected confusion. 'Not exactly; that is—I pray your Grace to pardon me; the queen will be displeased,' he faltered.

'Displeased!' exclaimed Denis impetuously; 'and wherefore? Speak the truth, sirrah, without fear, and faithfully. This minion is, then, often admitted to the queen's presence?'

'He is, my liege,' replied Bernardo, still with affected reluctance. 'Her Grace loves to talk of Castile with my comrade, he tells me.'

'To talk of Castile with him—to talk with her menial!' exclaimed the monarch angrily. 'By all the saints!' he continued, making a movement towards the royal apartment, 'he shall suffer for his presumption in daring to assert such a falsehood. Out of my path, sirrah!' Bernardo, however, throwing himself on his knees immediately before his sovereign, implored him with well-feigned fear, mingled with seemingly honest boldness, to pause.

'Beseech you, sire,' he said, 'punish not my comrade without due inquiry. He is young; he hath had some cause for pride in our royal mistress's favour: beseech you turn not to his hurt the words I have uttered at your command. Expose me not to the queen's anger.'

Greatly agitated, the king listened to him; but ere he could command his voice to reply, the now distant music ceased, and the page's step was heard in the antechamber. Denis motioned Bernardo to rise, and removing his hand from the hilt of his dagger, gazed sternly on the object of his wrath as he entered the corridor, who, surprised at seeing the king there, paused, and made his low and graceful obeisance. The young musician's cheek was flushed; there was a happy smile on his lip; and in his hand he held both his guitar and a small bunch of roses, which Denis at a glance recognised as the bouquet he had seen in the queen's bosom that morning. With a muttered ejaculation he turned from the boy, and then harshly desiring Bernardo to follow him, proceeded to his own apartment.

We will not repeat the conversation held there between the deceived sovereign and the deceiver. It will be sufficient to inform our readers that the art with which Bernardo wrought on the mental infirmity of the unhappy king was but too successful. Numberless unmeaning and trifling incidents apparently confirmed the slander. At Isabella's request, the page alone of all her suite had been detained in Portugal; he had been her companion from childhood: these remembrances, and the young wife's own imprudence, were more than enough to confirm the ready belief of jealousy. Denis, enraged as he was, preserved, however, a lingering pity for his queen—a just sense of the injury public investigation or vengeance might do to his own honour—and charging Bernardo, as he valued the favour his fidelity thus far had deserved, not to reveal aught that had passed between them, he shut himself up in his chamber for the remainder of the day, and the page withdrew to meditate upon the singular and perfect success of his vindictive malice.

Twilight was fast deepening into night as Denis of Portugal, attended only by the page Bernardo, left the palace, and rode rapidly across the wide plain beyond the city walls. He urged his noble charger on with a mad speed, as if he sought by the rapidity of its motion to banish the terrible and agonising thoughts which filled his mind. They had proceeded to the distance of about a mile on their apparently aimless course, and Bernardo had begun to entertain serious doubts of his liege's sanity, when a sudden glare of red light broke on the gloom of the darkening sky. Towards this spot Denis at once turned, and in a few minutes reined in his steed beside a huge furnace, round which a number of powerful and swarthy labourers were moving. One of them came forward as the horsemen paused, and asked in a rough voice 'their business.'

'Rather who are ye, and what do ye here?' demanded the king sternly.

'Truly, Sir Cavalier,' replied the man with a rude obeisance, for the majesty of the speaker's manner awed him, 'we are burners of lime for the new palace our good king is building.'

'Your good king will give you other fuel for your fire,' said Denis with a fearful laugh. 'Hark ye! I am Denis of Portugal, your king. To-morrow, at day-dawning, I will send you a trim page: throw him into your furnace!' A low murmur of surprise and horror ran through the group as they rose from their attitude of rude homage. 'How! do you dare hesitate to do my will!' exclaimed the king fiercely. 'Take heed ye feed not the flames yourselves.'

There was a brief pause. 'Sire,' said the first speaker at length, 'we are poor, but honest: our office is to burn lime, not men: beseech your Grace, make us not your executioners.'

The bold remonstrance would not, at another time, have been made in vain to 'the Good King Denis'; but it was, at the present moment, addressed to one whose reason was as little under his control as that of a maniac. Harshly, and with threats that, if they dared disobey his will, they should themselves suffer the doom they were unwilling to inflict upon another, the king reiterated his command, and received a sullen and reluctant assurance that it should be executed.

'But how, may it please your Grace,' asked the lime-burner, 'shall we know the page for the right one?'

'Ye have not often visits from royal pages methinks,' said the king impatiently; 'but to give you full assurance, the traitor will ask ye, "If the king's will be done;" and then see that ye do it, or beware!' As he finished his stern injunction, Denis rode away from the spot, leaving his amazed and awe-stricken subjects to discuss, in fear and trembling, the strange mandate they had received from him, whom they had fully recognised as their popular and hitherto merciful sovereign.

Our readers have of course divined that the fatal message was now intrusted to Gonzales, who at early dawn left the palace, in obedience to the royal behest,

though all unconscious of its purport. The opening day was even more than usually beautiful, and his path, which at first lay through the groves surrounding the palace, was gem-strewn with crystal dewdrops. The page's mind was keenly susceptible of beauty, and the holy voice of nature never spoke to his heart in vain. Thoughts and aspirations that were not of the earth awoke under the influence of the fresh balmy air and the music of the birds; and when the matin-bell from a sylvan chapel joined the general song, he started, and felt a sudden awe mingle with his thrill of delight. His feet lingered on the sod. The sweet yet solemn sound seemed to call him like a familiar voice; and obeying the promptings of his heart, he turned aside from the path, entered the consecrated building, and knelt in devout and humble prayer before the altar.

It was noonday; King Denis paced his chamber alone, a prey to the most torturing reflections. By this time his vengeance was sated, and with that thought came a reaction of feeling. A terrible doubt arose in his mind as to the possibility of his having been deceived: in short, reason was resuming its empire, and, dispirited and uncertain, he ordered Bernardo di Silva to his presence. The page could not be found; he had left the palace some two hours before. The attendant was in the act of giving this information to the agitated sovereign, when a low knock at the door interrupted him. Opening it at the king's command, he beheld Gonzales, pale, trembling, with an expression of unutterable horror on his usually calm features, standing before him. Had he turned his eyes towards his royal master, he would have been still more astonished at the expression his countenance wore as he recognised the page, who, whilst the king stood mute and motionless with amazement, advanced, and bending his knee, said in a faltering voice, 'Your will has been obeyed, sire!—my unhappy comrade is no more. I reached the limekiln in time to hear his death-cry.' He shuddered, and continued, after an instant's pause, 'The murderers—I crave your Grace's pardon—the executioners charged me to inform their king, that when he found resistance and intreaty vain, the miserable Bernardo acknowledged the justice of his fate; and his last audible words declared that he had wronged the queen, and abused your royal ear with falsehood.'

In emotion too great for speech, Denis of Portugal heard this extraordinary communication; and when at last he found words, it was to utter an ejaculation of thanksgiving to the Divine Providence which had saved him at least from the guilt of shedding innocent blood.

A long and careful inquiry explained the mysterious substitution. The morning mass was long, and ere Gonzales had quitted the chapel, Bernardo, believing that he must be already dead, left the palace, and proceeded to the kilns, to gratify his fiendish malice, by ascertaining that he had no longer a rival. He had either not heard the words agreed upon, or else, by a natural inadvertence, his first question was, '*Is the king's will done?*' and the lime-burners, recognising the sign, at once seized him, and, in spite of his intreaties and remonstrances, inflicted on him the fate intended for his betrayed comrade.

This fearful lesson was not wholly lost on Denis. His jealousy, if not entirely, was partially cured; and no after-imprudences on the part of the terrified and shocked Isabella gave occasion for its display or its control. Gonzales ceased, apparently, to be her favourite; but his rising fortunes did not therefore suffer. He became, in after-years, a powerful and confidential minister and counsellor of the king; the founder of a noble family in his adopted country. And never did the aged noble hear, without paying devout obedience to its summons, the voice of the matin bell!

Whether this singular legend be true or otherwise, it is a curious picture of a rude and nearly lawless age, and as such we present it to our readers. If the former, it is a striking instance of the visible working of that

Divine Power which, both history and experience teach us, frequently causes 'the wickedness of a man to fall on his own head;' so that in 'the pit he had privily digged for another, his own foot should be taken.'

HUGH MILLER'S FIRST IMPRESSIONS OF ENGLAND AND ITS PEOPLE.*

EVERYTHING that proceeds from a mind of such nerve and comprehensiveness as Hugh Miller's, must be entitled to attention. In the present volume he has embodied the observations he made upon the people of England during a two-months' tour, undertaken with a view to the recovery of health. But Mr Miller is a geologist: hence much, at intervals, regarding the Dudley coal-field, the ideas of Dean Cockburn, and so forth. He is also a zealously pious man: hence frequent references to the state of religion in England, with many general remarks on the character and effects of Christianity. Thus the book is a melange of somewhat whimsically grouped materials; and yet there is one unfailing principle of unity over all, in the energetic thinking, and rich though diffuse style of the author. We venture to recommend the book in an especial manner to intelligent Englishmen, as fitted to introduce them to a strain of opinion and mode of judgment to which they are all but strangers.

For our part, we are disposed, for the meantime at least, to overlook Mr Miller's geology, though that is in general masterly, and also his polemics, in order to arrive at those parts of his book which are of widest interest. It so happens that he received a bent in early life towards some of the English poets of the last century, who are now considered as mediocre. The accounts he had read of the poet-haunted mansion of Hagley, and of the *landscape poem* of the Leasowes of which Shenstone was the author, fixed themselves in his mind, and he now visited them with a pilgrim's reverence. 'Who has not heard,' he says, 'of Hagley, the "British Tempe," so pleasingly sung by Thomson in his *Seasons*, and so intimately associated in the works of Pope, Shenstone, and Hammond, with the Lord Lyttelton of English literature?' Remarking, very justly, how necessary it is for the description of a place to state those geologic features which may be said to form its bones, he tells us that Hagley derives its beauty from being a portion of a range of trap hills (the Clent Hills) starting up on the southern shore of the Dudley coal basin. In company with an under-gardener, Mr Miller 'emerged into the park, and began to ascend the hill by a narrow inartificial path, that winds, in alternate sunshine and shadow, as the trees approach or recede, through the rich moss of the lawn. Half-way up the ascent, where the hill-side is indented by a deep, irregularly-semicircular depression, open and grassy in the bottom and sides, but thickly garnished along the rim with noble trees, there is an octagonal temple, dedicated to the genius of Thomson—"a sublime poet," says the inscription, "and a good man"—who greatly loved, when living, this hollow retreat. I looked with no little interest on the scenery that had satisfied so great a master of landscape, and thought, though it might be but fancy, that I succeeded in detecting the secret of his admiration, and that the specialities of his taste in the case rested, as they not unfrequently do in such cases, on a substratum of personal character. The green hill spreads out its mossy arms around, like the arms of a well-padded easy-chair of enormous propor-

* London: John Johnstone. 1847. Pp. 407.

tions, imparting, from the complete seclusion and shelter which it affords, luxurious ideas of personal security and ease; while the open front permits the eye to expatiate on an expansive and lovely landscape. We see the ground immediately in front occupied by an uneven sea of tree-tops, chiefly oaks of noble size, that rise, at various levels, on the lower slopes of the park. The clear sunshine imparted to them this day exquisite variegations of fleecy light and shadow. They formed a billowy ocean of green, that seemed as if wrought in floss silk. Far beyond—for the nearer fields of the level country are hidden by the oaks—lies a blue labyrinth of hedgerows, stuck over with trees, and so crowded together in the distance, that they present a forest-like appearance; while, still farther beyond, there stretches along the horizon a continuous purple screen, composed of the distant highlands of Cambria.

In a more secluded hollow of the hill-side, Shenstone is commemorated by an urn. 'Yet a little further on, we descend into an opener and more varied inflection in the hilly region of Hagley, which is said to have been as favourite a haunt of Pope, and in which an elaborately-carved urn and pedestal records Lyttelton's estimate of his powers as a writer, and his aims as a moralist: "the sweetest and most elegant," says the inscription, "of English poets, the severest chastiser of vice, and the most persuasive teacher of wisdom." . . . The crooked little man, during the last thirteen years of his life, was a frequent visitor at Hagley; and it is still a tradition in the neighbourhood, that in the hollow in which his urn has been erected he particularly delighted. He forgot Cibber, *Sporus*, and Lord *Fanny*—flung up with much glee his poor shapeless legs, thickened by three pairs of stockings a-piece, and far from thick after all—and called the place "his own ground." It certainly does no discredit to the taste that originated the gorgeous though somewhat indistinct descriptions of "Windsor Forest." There are noble oaks on every side—some in their vigorous middle-age, invested with that "rough grandeur of bark, and wide protection of bough," which Shenstone so admired—some far gone in years, mossy and time-shattered, with white skeleton branches a-top, and fantastic scraggy roots projecting, snake-like, from the broken ground below. An irregular open space in front permits the eye to range over the distant prospect; a small clump of trees rises so near the urn, that, when the breeze blows, the slim branch-tips lash it as if in sport, while a clear and copious spring comes bubbling out at its base.

'I passed somewhat hurriedly through glens and glades—over rising knolls and wooded slopes—saw statues and obelisks, temples and hermitages—and lingered a while ere I again descended to the lawn, on the top of an eminence which commands one of the richest prospects I had yet seen. The landscape from this point—by far too fine to have escaped the eye of Thomson—is described in the "Seasons;" and the hill which overlooks it represented as terminating one of the walks of Lyttelton and his lady—that Lady Lucy whose early death formed, but a few years after, the subject of the monody, so well known and so much admired in the days of our great-grandmothers:—

—"The beauteous bride,
To whose fair memory flowed the tenderest tear
That ever trembled o'er the female bier."

It is not in every nobleman's park one can have the opportunity of comparing such a picture as that in the "Seasons" with such an original. I quote, with the description, the preliminary lines, so vividly suggestive of the short-lived happiness of Lyttelton:—

"Perhaps thy loved Lucinda shares thy walk,
With soul to thine attuned. Then nature all
Wears to the lover's eye a look of love;
And all the tumult of a guilty world,
Toosed by the generous passions, sinks away;
The tender heart is animated peace;
And, as it pours its copious treasures forth
In various converse, softening every theme,

You, frequent pausing, turn, and from her eyes—
Where weakened sense, and amiable grace,
And lively sweetness dwell—unraptured drink
That nameless spirit of ethereal joy—
Unutterable happiness!—which love
Alone bestows, and on a favoured few.
Meantime you gain the height from whose fair brow
The bursting prospect spreads immense around,
And, snatched o'er hill and dale, and wood and lawn,
And verdant field, and darkening heath between,
And villages embosomed soft in trees,
And spiry towns by surging columns marked
Of household smoke, your eye excurse roams,
Wide stretching from the Hall, in whose kind haunt
The *Hopitable Genius* lingers still,
To where the broken landscape, by degrees
Ascending, roughens into rigid hills,
O'er which the Cambrian mountains, like far clouds
That skirt the blue horizon, dusky rise."

'As I called up the passage on the spot where, as a yet unformed conception, it had first arisen in the mind of the writer, I felt the full force of the contrast presented by the two pictures which it exhibits—the picture of a high but evanescent human happiness, whose sun had set in the grave nearly a century ago; and the picture of the enduring landscape, unaltered in a single feature since Lyttelton and his lady had last gazed on it from the hill-top. "Alas!" exclaimed the contemplative Mirza, "man is but a shadow, and life a dream!"

Mr Miller enters at some length into the remarkable history of the two Lytteltons—the elder an upright, excellent man, the younger a selfish profligate. How strange, that from George Lord Lyttelton and his amiable Lucy should have proceeded the heartless debauchee, Thomas, the second lord! Our author has also chosen to put together, from various sources, the extraordinary story of the death of the latter person. 'Among the females who had been the objects of his temporary attachment, and had fallen victims to it, there was a Mrs Dawson, whose fortune, with her honour and reputation, had been sacrificed to her passion, and who, on being deserted by his lordship for another, did not long survive: she died broken-hearted, bankrupt both in means and character. But though she perished without a friend, she was yet fully avenged on the seducer. Ever after, he believed himself haunted by her spectre. It would start up before him in the solitudes of Hagley at noon-day—at night it flitted round his pillow—it followed him incessantly during his rustication on the continent—and is said to have given him especial disturbance when passing a few days at Lyons. In England, when residing for a short time with a brother nobleman, he burst at midnight into the room in which his host slept, and begged, in great horror of mind, to be permitted to pass the night beside him: in his own apartment, he said, he had been strangely annoyed by an unaccountable creaking of the floor. He ultimately deserted Hagley, which he found by much too solitary, and in too close proximity with the parish burying-ground; and removed to a country-house near Epsom, called Pit Place, from its situation in an old chalk-pit. And here, six years after the death of his father, the vital powers suddenly failed him, and he broke down and died in his thirty-sixth year.

'His lordship,' continues Mr Miller, 'had made the usual opening address to the sovereign [November 1779] the occasion of a violent attack on the administration; "but this," says Walpole, "was, notwithstanding his government appointment, nothing new to him; he was apt to go point blank into all extremes, without any parenthesis or decency, nor even bogged at contradicting his own words." In the evening he set out for his house at Epsom, carrying with him, says the same gossiping authority, "a caravan of nymphs." He sat up rather late after his arrival; and on retiring to bed, was suddenly awakened from a brief slumber a little before midnight by what appeared to be a dove, which, after fluttering for an instant near the bed-curtains, glided towards a casement window in the apartment,

where it seemed to flutter for an instant longer, and then vanished. At the same moment his eye fell upon a female figure in white, standing at the bed-foot, in which he at once recognised, says Warner, "the spectre of the unfortunate lady that had haunted him so long." It solemnly warned him to prepare for death, for that, within three days, he should be called to his final account; and having delivered its message, immediately disappeared. In the morning his lordship seemed greatly decomposed, and complained of a violent headache. "He had had an extraordinary dream," he said, "suited, did he possess even a particle of superstition, to make a deep impression on his mind;" and in afterwards communicating the particulars of the vision, he remarked—rather, however, in joke than in earnest—that the warning was somewhat of the shortest; and that really, after a course of life so disorderly as his, three days formed but a brief period for preparation. On Saturday he began to recover his spirits; and told a lady of his acquaintance at Epsom, that as it was now the third and last day, he would, if he escaped for but a few hours longer, fairly "jockey the ghost." He became greatly depressed, however, as the evening wore on; and one of his companions, as the critical hour of midnight approached, set forward the house-clock, in the hope of dissipating his fears, by misleading him into the belief that he had entered on the fourth day, and was of course safe. The hour of twelve accordingly struck; the company, who had sat with him till now, broke up immediately after, laughing at the prediction; and his lordship retired to his bedroom, apparently much relieved. His valet, who had mixed up at his desire a dose of rhubarb, followed him a few minutes after, and he sat up in bed, in apparent health, to take the medicine; but being in want of a teaspoon, he despatched the servant, with an expression of impatience, to bring him one. The man was scarce a minute absent. When he returned, however, his master was a corpse! He had fallen backwards on the pillow, and his outstretched hand still grasped his watch, which exactly indicated the fatal hour of twelve. It has been conjectured that his dissolution may have been an effect of the shock he received, on ascertaining that the dreaded hour had not yet gone by: at all events, explain the fact as we may, ere the fourth day had arrived, Lyttelton was dead. It has been farther related, as a curious coincidence, that on the night of his decease, one of his intimate acquaintance at Dartford, in Kent, dreamed that his lordship appeared to him, and drawing back the bed-curtain, said, with an air of deep melancholy, "My dear friend, it is all over: you see me for the last time."

The story has been variously accounted for. Some have held, as we learn from Sir Walter Scott in his "Demonology," that his lordship, weary of life, and fond of notoriety, first invented the prediction, with its accompanying circumstances, and then destroyed himself to fulfil it. And it is added, in a note furnished by a friend of Sir Walter's, that the whole incident has been much exaggerated. "I heard Lord Fortescue once say," says the writer of the note, "that he was in the house with Lord Lyttelton at the time of the supposed visitation, and he mentioned the following circumstances as the only foundation for the extraordinary superstructure at which the world has wondered:—A woman of the party had one day lost a favourite bird, and all the men tried to recover it for her. Soon after, on assembling at breakfast, Lord Lyttelton complained of having passed a very bad night, and having been worried in his dreams by a repetition of the chase of the lady's bird. His death followed, as stated in the story." Certainly, had this been all, it would be scarce necessary to infer that his lordship destroyed himself. But the testimony of Lord Fortescue does not amount to more than simply that, at first, Lord Lyttelton told but a part of his dream; while the other evidence goes to show that he subsequently added the rest. Nor does the theory of the premeditated suicide seem particularly happy. If we must indeed hold that the agency

of the unseen world never sensibly mingles with that of the seen and the tangible,

"To shame the doctrine of the Sadducees,"

we may at least deem it not very improbable that such a vision should have been conjured up by the dreaming fancy of an unhappy libertine, ill at ease in his conscience, sensible of sinking health, much addicted to superstitious fears, and who, shortly before, had been led, through a sudden and alarming indisposition, to think of death. Nor does it seem a thing beyond the bounds of credibility or coincidence, that, in the course of the three following days, when prostrated by his ill-concealed terrors, he should have experienced a second and severer attack of the illness from which, only a few weeks previous, he had with difficulty recovered.

On approaching the Leasowes, Mr. Miller had occasion to ask his way at a small nail workshop. 'The sole workers in the nailery were two fresh-coloured, good-looking young girls, whose agile, well-turned arms were plying the hammer with a rapidity that almost eluded the eye, and sent the quick glancing sparks around them in showers. Both stopped short in their work, and came to the door to point out what they deemed the most accessible track. There was no gate, they said, in this direction, but I would find many gaps in the fence: they were in doubt, however, whether the people at the "white house" would give me leave to walk over the grounds: certainly the nailer lads were frequently refused; and they were sorry they couldn't do anything for me: I would be sure of permission if they could give it me. At all events, said I, I shall take the longest possible road to the white house, and see a good deal of the grounds ere I meet with a refusal. Both the naileresses laughed; and one of them said she had always heard the Scotch were "long-headed." Hales Owen and its precincts are included in the great iron district of Birmingham; and the special branch of the iron trade which falls to the share of the people is the manufacture of nails. The suburbs of the town are formed chiefly of rows of little brick houses, with a nail-shop in each; and the quick, smart patter of hammers sounds incessantly, in one encircling girdle of din, from early morning till late night. As I passed through, on my way to the Squire's Mill, I saw whole families at work together—father, mother, sons, and daughters—and met in the streets young girls, not at all untidily dressed, considering the character of their vocation, trundling barrowfuls of coal to their forges, or carrying on their shoulders bundles of rod-iron. Of all our poets of the last century, there was scarce one so addicted to the use of those classic nicknames which impart so unreal an air to English poetry, when bestowed on English men and women, as poor Shenstone. We find his verses dusted over with Delias, and Cecilias, and Ophelias, Flavias, and Fulvias, Chloes, Daphnes, and Phillises; and, as if to give them the necessary prominence, the printer, in all the older editions, has relieved them from the surrounding text by the employment of staring capitals. I had read Shenstone early enough to wonder what sort of looking people his Delias and Cecilias were; and now, ere plunging into the richly-wooded Leasowes, I had got hold of the right idea. The two young naileresses were really very pretty. Cecilia, a ruddy blonde, was fabricating tackets; and Delia, a bright-eyed brunette, engaged in heading a double-double.'

Mr. Miller is able to repay the compliment the two female nailers paid to his nation. 'There was,' he says, 'a nail-manufactory established about seventy years ago at Cromarty, in the north of Scotland, which reared not a few Scotch nailers; but they seemed to compete on unequal terms with those of England; and after a protracted struggle of rather more than half a century, the weaker went to the wall, and the Cromarty nailworks ceased. There is now only a single nail-forge in the town; and this last of the forges is used for other purposes than the originally-intended one. I

found in Hales Owen the true key to the failure of the Cromarty manufactory, and saw how it had come to be undersold in its own northern field by the nail-merchants of Birmingham. The Cromarty nailer wrought alone, or, if a family man, assisted but by his sons; whereas the Hales Owen nailer had, with the assistance of his sons, that of his wife, daughters, and maiden sisters to boot; and so he bore down the Scotchman in the contest, through the aid lent him by his female auxiliaries, in the way his blue-painted ancestors, backed by not only all the fighting-men, but also all the fighting-women of the district, used to bear down the enemy.

THE INSTINCT OF GENIUS.

NOTHING more touchingly evinces that goodness presides over this world of ours, than the endless variety it affords. Were this earth one vast plain, however fresh and green, the eye would tire of its monotony; were there no diversity of manner or difference of temperament, no contrariety of opinion, no dissimilitude of taste, how the spirit would weary of all converse, and sicken at the dull uniformity, which would be but a grade removed from the pangs of solitary confinement! But it is far otherwise: hill and dale, mountain and valley, the broad ocean and the rippling stream, the lofty tree and graceful shrub, with the innumerable forms and tints of flowers, the varied plumage of birds, and their distinctive notes, are all calculated to give delight. Then the human race vary so much in feature and expression, as to give an individual interest to every one we meet. But the difference is not alone in outward appearance, for each is distinguished by as great a difference of temper and taste as of form and face. Some have asserted that all are born with the same tastes, and that it is owing to education alone that these have been so remarkably developed in some, while in others they have been suppressed. Education can do much; and accident may sometimes stand in the place of education, and foster the germ of some noble power, which afterwards expands into full vigour; but that some are actually born with a latent power, ready to burst forth, must surely be acknowledged by any one who has inquired into the early dawnings of genius.

Serah Colburn and Jedediah Buxton may be just mentioned as types of the intuitive arithmeticians; the one solving the most difficult questions in infancy, and the other, while yet an infant in knowledge—for he was utterly illiterate—showing a power of calculation that appeared altogether incredible.

Crecembien, so celebrated for his literary attainments and exertions, but, above all, for his poetic genius, discovered 'the mind that burned within him' at a very early age. He stood apart from the sports of his young companions, and gave himself up to a passionate love for poetry, which was discovered to his father in a manner quite accidental. He handed the boy a volume of Ariosto, and told him to amuse himself with the engravings. After the child returned the book, and as his father was about to replace it in the book-case, he perceived pencil-marks on the margin. After a close examination, he found that the boy had marked all those passages most admired for their beauty—a selection wholly prompted by the child's exquisite taste. Astonished and delighted, his father instantly determined to give him every advantage. Lope de Vega, it is said, could recite verses of his own composition long before he could read. It is indeed quite extraordinary to think of the number of poets who have manifested from infancy their high calling. Giotti, the shepherd boy, was

found by Cimabue, who accidentally passed that way, tending the flock he had been left to watch, and tracing the figures of the sheep on the faithless sand with admirable skill. It is curious to observe how often the parents of children in the higher rank have endeavoured to suppress the genius of their offspring. The immortal Michael-Angelo Buonarroti, at a very early age, manifested the genius which will distinguish him to the end of time; but his father, who considered that the profession of the fine arts would be a degradation to one of his birth, did all he could to detach him from the pursuit which was to immortalise him, and determined to bring him up to one of the learned professions: but genius is not to be stayed, and Michael-Angelo triumphed over every obstacle. The father of Sir Joshua Reynolds often reproved him for making drawings, instead of minding his lessons: this is amusingly recorded on the back of one of those drawings—'Done by Joshua, out of pure idleness.' Those in humble life have been more fortunate in being permitted by their relations to follow the bent of their genius: their difficulties and obstacles have generally been of a different nature. The memoirs of West are very interesting, and detail the manner in which his father and mother first became acquainted with his great powers. He was left to watch the infant sleeping in the cradle one day, while his mother went to the garden to collect some flowers. As the boy sat by the cradle, the infant smiled in her sleep; he was struck with its beauty, and hastily getting a piece of paper, he took its likeness in black and red ink. His mother returned, and snatching the paper, exclaimed to her daughter, 'I declare he has made a likeness of little Sally!' At this time he was but seven years old. In a year after, a party of roaming Indians saw his sketches of birds and flowers, which they greatly admired, and showed him in return some of their own, and taught him how to prepare the red and yellow colours with which they dyed their weapons. To these colours his mother added indigo. He was anxious to know how he could lay the colours on, and was told that a camel's-hair brush was the fit thing for the purpose. As there were no camels in America, poor Benjamin was obliged to draw on his own invention for a substitute. He accordingly supplied all deficiencies from the back and tail of a favourite cat. The bad condition of her fur was supposed to be the consequence of some disease, till the young painter confessed that he had levied contributions on her.

In Barry's life there are many highly-interesting passages. He, too, devoted himself early to his captivating art; and all the pocket-money he could procure he laid out in pencils and candles. He spent his nights in drawing, after all the family had gone to rest, which had such a sensible effect upon his looks, that the servants dreaded injury to his health; and, to oblige him to go to bed, they would secrete his candle while settling his room. He determined, in consequence of this, that they should enter his room no more; and so locked his door, and made his own bed. At last his mother intreated that he would allow his bed to be made more comfortably, and his room to be put in order; but, true to his determination, he would admit no one: he was resolved to give up his nights to the pursuit which he so passionately loved.

We are told of Opie—then a boy of about ten years old—that one Sunday, when his mother was at church, he settled himself to draw in a little kitchen, which commanded a view of the parlour where his father sat reading. He had completed his sketch all but the head,

and when he came to that, he ran in and out of the parlour, and looked up in his father's face so often, that he became seriously displeased with the boy for interrupting him so incessantly, and threatened to correct him if he continued so troublesome. This was exactly what he had wished: he wanted to paint his father's eyes when they flashed with anger; and having succeeded in his plan, he sat down quietly to finish the portrait. His mother did not return till it was completed. The moment she came in, he placed it before her. She instantly knew it, and then rebuked him for having misspent the Sabbath; but all feeling of the reprimand was lost in the joy which he felt in finding that the likeness of his portrait was acknowledged, and he threw himself into his mother's arms in a transport of delight. Canova was oddly brought into notice at an early age. He was in the habit of accompanying his grandfather when he was employed in the repairs or the embellishments of the villas of the nobility, who had their delightful summer residence at Passagno. It happened that while engaged at the villa of Falier, there was a grand fête given, and there was a disappointment about an ornament for the middle of the table at the dessert, so that the domestics, who were accountable for the arrangement of the entertainment, were sadly afraid of incurring the displeasure of their master. They told Canova of their unfortunate plight, but no one could suggest a remedy. However, the grandson, who had heard all that passed, asked for some butter, out of which, in a few minutes, he modelled a lion, which was no sooner laid on the table, than it excited the applause and admiration of the company. It was executed with such consummate skill, that the servants were questioned; and it was found that little Canova, then a child, was the modeller. He was called for, and timidly and bashfully he entered the apartment, where he was greeted by the praises and caresses of the distinguished guests. The Senator Falier took him under his immediate protection; and never did artist more nobly fulfil the early promise of surpassing excellence. His sculptures are spread all over Europe, and even the perfection of his earlier works is acknowledged by the world. It is singular that Chantry should have been indebted to a similar accident for the discovery of his genius. It was at the table of a wealthy lady, that the flowers and ornaments in paste were so beautifully executed, as to attract the notice of the company. The housekeeper was spoken to, and acknowledged to her mistress that they had been the production of a little nephew of hers, who was fond of amusing himself in this way. The lady, struck by the taste which he had discovered, determined to give him the advantage of instruction, and sent him up to London for the purpose. How he availed himself of his good fortune is well known.

In bringing to mind the prodigies that have from time to time appeared, it would seem that the musical world can boast of a greater number than any other. It may be that circumstances combine to cultivate the taste for music almost from the first moment its professor becomes an inhabitant of this world. The gentle lullaby of the nurse, and the melody of the mother's caressing voice, may make an impression from the first moment that they strike the ear, so delicately formed for harmonious sounds. Everything was done to repress the genius of Handel. He was intended by his father for the profession of the law, and he could not brook his passion for music. He excluded all musical society from his house, so that the child was utterly deprived of the aliment for which his soul languished. However, notwithstanding all his father's precautions, he heard a performer on the harpsichord; and he was so enchanted, that he resolved to get a little clarichord secreted in one of the attics, and soon prevailed on one of the servants to arrange this for him. Every night, when the rest of the family had gone to rest, he retired to his loved clarichord; and there, self-taught, he laid the foundation of the wonderful perfection at which he was afterwards to arrive. When he was about seven years old, his father

set out to visit a son by his first wife, who was living with the Duke of Saxe-Weissenfels. The young musician had solicited leave to accompany his father on his journey, but he was refused. He, however, ran after the carriage, and having got up to it, his tears and intreaties at length prevailed, and his father took him in. Amused by the variety of the court, he wandered about from room to room; but his progress was arrested whenever he saw a harpsichord, for he could not resist the impulse to sit down and play. This passed unobserved; but after a few days, when service was over in the chapel, he contrived to steal his way to the organ, and as he touched it, the duke, who was quitting the chapel, but not yet out of hearing, was attracted by the remarkable style of the performance. He inquired who the performer was, and was told that he was a boy of seven years old, and step-brother to his attendant. The duke sent for the child and his father. The conversation which took place ended in consent being given on the father's part that his son should be forthwith instructed in music. Thus was it owing to that accidental journey, against which there had appeared to be an insurmountable obstacle, that the power which was to charm in every age and every clime was fostered by cultivation.

Haydn, though his father was but a cart and wheel wright, and though his mother had been in no higher station than that of a cook before her marriage, was so fortunate as to find encouragement for his genius in the taste and love for music of both his parents. His father had a fine voice, and though he had no scientific knowledge of music, he could play on the organ and on the harp; and he would sometimes accompany himself and his wife, who also sung. On these occasions the child would stand with two pieces of wood in his little hands, one of which represented his viol, and the other his bow, and appear to accompany the singing and playing of his parents. By accident, the powers of this extraordinary child were discovered, by the arrival of an excellent musician, who was cousin to his father. As he joined in their concert, he was struck by the astonishing precision with which little Haydn, then but six years old, beat time to their singing. This relative took him under his care, that his wonderful genius might not lack cultivation. He had not been two days domesticated in his new abode, when he discovered two tambourines, out of which he constructed a kind of instrument; and notwithstanding its unpromising appearance, he succeeded in producing an air upon it which delighted all who heard it. When crowned with success, and in the midst of all the honours and pleasures of the world, Haydn would recur to the happy days of his childhood with a depth of tenderness and regret which showed that they had been the most delightful part of his life. The domestic concerts were among his dearest recollections; and he could never hear the simple native airs which had been sung to him by his mother, without the most intense delight, mingled with a fond sadness.

The ingenuity which Haydn showed in constructing his rude instrument was surpassed by the contrivance of Davy. Davy, who was the son of a Devonshire farmer, was continually loitering about a neighbouring forge, where he busied himself in examining and sounding the horses' shoes. The smith did not mind this for a long time, as he thought the child was merely amusing himself; but having missed several of the shoes from time to time, his suspicion was raised against the boy, and he determined to have him watched. It was perceived one day that he took two shoes from a parcel which he had been sounding for a long time, and went off with his prize. He was followed to a loft, where he had made a hiding-place for himself, without the knowledge of any of his family. Here he was found earnestly arranging the stolen goods among a number of other horse-shoes which he had suspended with wires, so as to form a rude musical instrument, on which he played by striking them with a small hammer. He could play several tunes, among which was one with variations,

well known, as it was frequently heard chimed by the bells in the parish steeple. The smith, admiring his ingenuity, and struck by his musical powers, not only pardoned the theft, but joined in a subscription which was raised to place him under musical instruction.

Among the musical prodigies, Gietry, the celebrated composer so universally admired, holds a distinguished place. The first demonstration of his passion for music was so comical, that it is best told in his own words:—‘The first lesson I received,’ says he, ‘nearly cost me my life; I was alone at four years old, when the boiling of an iron pot attracted my attention: I began dancing to the music of this drum. Afterwards, wishing to see how it was produced in the vessel, I overturned it into a very hot fire, and the explosion was so great, that I was scalded all over, and nearly suffocated.’ His love for music was a second time near costing him his life in his boyhood, which is thus simply related by himself:—‘In my country, they tell children that God will not refuse them anything they ask of Him on the day of their first communion. I had for a long while resolved to ask Him that I might die on the day of that august ceremony, if I was not destined to become an honest man, and one distinguished in my station. On that very day I was nearly killed. Having gone into a tower to witness the striking of the wooden bells, of which I had no idea, a beam, which weighed three or four hundred pounds, fell upon my head. The churchwarden ran for the extreme unction. I had been knocked down senseless. When I came to myself, I hardly recollected where I was. They showed me the beam that had fallen on my head: “Never mind, said I, since I am not killed, I shall be an honest man, and a good musician.”’ From this time we find that the young enthusiast became habitually thoughtful; his gaiety changed into melancholy, and music alone had power to soothe his sadness. The deep devotion, marked though it be by a touch of superstition (so often the case in the enthusiastic), the tender affection, and the engaging modesty, are so sweetly portrayed in his little sketch of his first musical triumph, that it will not be unacceptable. ‘My timidity had a support which was known only to myself. I had felt for the last year a devotion to the Virgin Mary, almost amounting to idolatry; and having for nine days implored her assistance, I was confident in the protection of Heaven. The motet which I sang was an Italian air, translated into Latin, an address to the Virgin, *Non semper super prata casta florescit rosa*. I had hardly sung four bars, when the orchestra softened itself to pianissimo, for fear of overpowering me. I at that moment darted a glance at my father, to which he returned a smile. The children of the choir who surrounded me drew back from respect; almost all the singers left their seats, and did not even hear the bell which announced the elevation of the host. I at that moment perceived my good mother in the church; she wiped away her tears, and I could not restrain my own.’ With such powerful incitements as devotion and affection, it would have been strange if Gietry had not reached the celebrity to which he attained. It would be a pleasant task to follow him in the artless narrative which he gives of his visit to Italy; but enough has been said to instance him as an example of the early dawning of genius.

Sensibility, modesty, and simplicity, the meet, and almost always the constant, attendants of genius, were as remarkable in Mozart as in Gietry. He was so playful a child, that he frequently neglected his meals while he indulged in his sports; but though careless and wild, he had a nature the most sensitive—the most ardent affections and tender feelings found their place in his heart. ‘Do you love me?’ twenty times in the day he would inquire of his fond parents, and of those about him. They would sometimes answer ‘No,’ in jest; and then the loving child would cry, as if his very heart would break. His passion for music was apparent at three years old. He listened with deep interest to the lessons which his sister received on the harpsichord;

and he would search the instrument for *thirds*, and testify his delight in the wildest manner when he found them. His ear was so delicately acute, that he could not bear the blast of a trumpet; if he accidentally heard it, he was almost convulsed with terror; and such an impression did it make on him, that he could not bear even to see it. His father determined to conquer this antipathy, and ordered the instrument to be sounded, notwithstanding the earnest intreaties of the child to the contrary. It sounded; a deathlike paleness overspread his face, and he fell to the ground: most surely his father never repeated the experiment. At four years old, he would learn in half an hour to play a minuet, and a more difficult piece in the space of an hour, executing them with the greatest precision. At five years old he began to compose; and in his sixth year, the infant prodigy visited some of the German courts, accompanied by his parents and sister; and in his seventh year, his fame having spread all over Europe, he visited its principal countries, giving concerts in the large towns, where he was listened to with admiration and astonishment almost unbounded. At thirteen he brought out a successful opera. The beauty and variety of his compositions, the brilliancy of his performance, and the magical effect of those extempore pieces with which he delighted his audience, the exquisite pathos of the tender passages, and the fire and energy of the more impassioned effusions, could not fail to awaken an enthusiasm in all who listened. Never spoiled by adulation and applause, he preserved throughout his brilliant career the modesty, artlessness, and sensibility for which he had been so remarkable in childhood. His love and reverence for his father, his tender affection for his mother, and for all near and dear to him, and his deep passion for the science to which he had devoted himself, were all sufficient to him. His character, and the striking and interesting passages of his brief life, are so universally known, that it would be idle to enlarge on them; enough has been said to show that he was a bright example of the early dawning of genius.

It would be going into too great length were all the examples brought forward that might be selected; it is very remarkable that there are scarcely any among the great composers who have not shown the bent of their mind in infancy. In looking over their memoirs, it is quite extraordinary to observe what a number of musical prodigies have existed; but one more shall only be noticed in the present paper. William Crotch, the son of a carpenter, is indeed a striking example of the force of genius. His father, who had no knowledge of music, had learned to play ‘God Save the King,’ and a few other tunes, on an organ which he had built. William, then a child of but a year and a half old, was observed to pay undivided attention to music; so much so, that he would refuse his food when listening to the organ. Before he was two years old, he would touch the key-note of his favourite tunes when he wanted to have them played; and very shortly after, he would strike two or three of the first notes, when he thought he had not made himself understood. Mrs Lulman, a first-rate performer, came one evening to try the organ. After she was gone, the child cried, and was so peevish, that his mother could not quiet him. At length, in passing through the dining-room, he screamed and struggled so violently to get to the organ, that he was brought to it, when he beat down the keys with his little hands. The next day, while seated at it on his brother’s knee, he played enough of ‘God Save the King’ to awaken his father’s curiosity. He hastened down from his workshop, but nothing could exceed the astonishment which he felt when he saw that little William was the performer, a child of but two years and three weeks old. When Mrs Crotch, who had been out, came in, her husband met her, and bade her follow him up stairs, where he had something curious to show to her. She was longing to know what she was to see, but her surprise and delight on hearing her child was as great as that of her hus-

band. 'God Save the King' had made an impression on him, as he had not only heard his father play it, but it was frequently sung to him by his mother as she lulled him to sleep; but, more than all, it had been most delightfully played by Mrs Lulman the evening before, when he was so much excited. Crotch, who was employed by Mr Paul, absented himself one day on account of illness. As Mr Paul passed his door, he heard the organ, and feeling vexed at having been imposed on by a false excuse, as he supposed, he walked into the house, expecting to find Crotch at the organ; but what was his astonishment when he beheld the child playing on it! Mr Paul was so struck with astonishment, that he brought two or three persons to hear him, and in a short time the story spread, and the next day more than a hundred went to listen; and from that time such crowds collected, that the admittance of visitors was obliged to be limited to one day in the week. The progress he made was truly wonderful: sadness was the impression which any air that pleased him made upon him: it became fixed in his memory, and it took him but a short time till he played it. The wonderful delicacy and acuteness of his ear enabled him to name any note which was struck, though out of sight of the keys. Dr Burney gives a very interesting account of Crotch, and notices several other musical prodigies. Among them the Westleys are named as very surprising—the younger particularly, who, before he was six years old, surpassed in many particulars the attainments of most professors; and, before he could write, composed the airs of several oratorios, which he retained in memory, and at eight years old noted them down.

It is not alone from these few examples of the early indication of genius that it is apparent that the faculties are born with us by which we become distinguished in life; but the same fact is exhibited in the memoirs of almost all eminent persons; and thus Cicero's observation, when he says, that 'without divine inspiration, no man was ever great,' scarcely appears extravagant.

POETS AND FLOWERS.

FLOWERS are such beautiful objects, so abounding in loveliness, so faithfully represent all shades of thought—of childhood's careless hours, manhood's recreation, and age's solace—that we cannot wonder at the frequent mention made of them by poets. In all times they have been especial favourites of the bards, who have found in them a world of matchless similes, a perpetual harvest of exquisite images. The pages of Holy Writ contain many interesting examples of the moral hid in flowers: their frail and transitory nature was too apt an illustration of human life to escape the notice of the inspired penmen. How many of the great and the good have entertained a reverent love for flowers! In many parts of the world flowers have been used as emblems of a religious feeling, and offered on altars: they adorned the triumph, the festival, and bridal; or lightened suffering, and beautified death. How many flowers yet retain the names given to them by our devout Catholic forefathers! and how many bewitching fables are associated with their brilliant tints and graceful forms! The Medici, so famed for their love of the beautiful, are said to have been the first to open a flower-garden to the public: it was not the least of the pleasures which they conferred on the citizens of Florence: and in the old Italian poets, we find abundant proofs of the delight they took in flowers.

Lord Bacon says of a garden, that 'it is the purest of human pleasures;' and according to the author of *Night Thoughts*, 'a garden weeds the mind: it weeds it of worldly thoughts, and sows celestial seed in their stead.' But to go back to glorious old Chaucer, hear what he sings of the daisy—

— 'When the month of May
Is come, and I can hear the small birds sing,
And the fresh flowers have begun to spring,
Good-by, my book! devotion too, good-by!
Now this peculiar frame of mind have I,
That among all the flowers of the mead,
I love the most that flower, white and red,
Which men in our town the daisy name.

* * *
I might, day by day,
Dwell all throughout the jolly month of May,
Withouten sleep, withouten mead or drink:
Adown full softly I began to sink,
And, leaning on my elbow and my side,
Through the whole day I shaped me to abide,
For nothing else, and I shall tell no lie,
But on the daisy for to feed mine eye,
That has good reason why men call it may
The daisy, otherwise the eye of day,
The empress and the flower of flowers all:
I pray to God that fair may it befall,
And all that love the flowers for her sake.'

Gavin Douglas, a Scottish poet of the fifteenth century, describes the flowers which make their appearance in May, in quaint language—

'The daisy did on-bred her crownall small,
And every flower unlappt in the dale.
Sere downis small on dentillion sprang;
The young green-bloomed strawberry-leaves amang;
Jimp Jerybours thereon leaves unahet,
Fresh primrose and the purpore violet;
Heavenly lillies, with lockerand toppis white,
Opened and show their crestis redemite.'

The daisy seems to have attracted notice when other flowers have been disregarded. Some touching lines were written some years since by a person in India, who found an English daisy in a box of roots which had been sent out to him. The gaudy flowers of the East were all forgotten in the humble memorial of home—the cool and green meadows of England. Shakespeare did not forget the 'cheerful flower' in his sprightly lines—

'When daisies pied and violets blue,
And cuckoo-buds of yellow hue,
And lady-smocks all silver white,
Do paint the meadows with delight.'

Wordsworth says that the daisy assumes many different characters as he sits to watch it—

'A nun demure of lowly port;
A sprightly maiden of Love's court,
In thy simplicity the sport
Of all temptations;
A queen in crown of rubies drest;
A starveling in a scanty vest;
Are all, as seems to suit thee best,
Thy appellations.'

The poet further tells us that he owes to the contemplation—

'An instinct call it, a blind sense;
A happy genial influence,
Coming one knows not how, nor whence,
Nor whither going;'

betraying some of the rapturous feeling described by Chaucer. We need do no more than allude to Burns: his beautiful lines to the daisy—

'Wee, modest, crimson-tipped flower'—

are so well known, as to have become a household poem. Notwithstanding the succession of flowers, from the

'Chaste snow-drop, venturous harbinger of spring,
And pensive monitor of fleeting years,'

chilled by the frosty breath of February, to the asters that linger until the early frosts of October have dyed the autumn woods, poets have done homage to them all. In the masque, *Pan's Anniversary*, Ben Jonson introduces one of the nymphs singing—

'Strew, strew the glad and smiling ground
With every flower, yet not confound
The primrose drop, the spring's own spouse,
Bright days-eyes, and the lips of cows,
The garden-star, the queen of May,
The rose, to crown the holiday.'

A shepherd standing by, however, enumerates several others which should also be brought—

'Fair ox-eye, goldy-locks, and columbine,
Pinks, garlands, king-cups, and sweet sops-in-wine,
Blue harebells, paeles, pansies, calaminth,
Flower-gentle, and the fair-haired hyacinth,
Bring rich carnations, flower-de-luces, lilies,
The chequed, and purple-ringed daffodillies.'

Daffodils seem to have been held in much favour by our old poets, if we may judge from the frequent mention they make of them; Spenser says in the 'Shepherd's Calendar'—

'Strove me the ground with daffadownhillies,
And cowslips, and king-cups, and loved lillies.'

Herrick, whose poems are models of melodious gladness—lyrical sermons—addresses them thus—

'Fair daffodils, we weep to see
You haste away so soon;
As yet the early rising sun
Has not attained his noon:
Stay, stay,
Until the hastening day
Has run
But to the even-song;
And having prayed together, we
Will go with you along.'

And Milton marshals flowers in imperishable verse—

'Bring the rathe primrose that forsaken dies,
The tufted crowtoe and pale jessamine,
The white pink, and the pansy freaked with jet,
The glowing violet;
The musk-rose, and the well-attired woodbine,
With cowslips wan that hang the pensive head,
And every flower that and embroidery wears,
Bid amaranthus all his beauty shed,
And daffodillies fill their cups with tears.'

The author of 'Paradise Lost' had an exquisite perception of the beauty and poetry of flowers. How the memory of them haunted him in his blindness, we may judge by the touching lines—

'Seasons return, but not to me returns
Day, or the sweet approach of eve or morn,
Or sights of vernal bloom, or summer's dawn.'

Eve's nuptial bower is described as adorned with

— 'Each beauteous flower,
Iris all hues, roses, and jessamine,
Reared high their flourished heads between, and wrought
Mosaic; underfoot the violet,
Crocus, and hyacinth, with rich inlay
Brodered the ground, more coloured than with stone
Of costliest emblem.'

And again, in Adam's farewell to Paradise—

— 'Oh flowers!
That never will in other climate grow,
My early visitation, and my last
At ev'n, which I bred up with tender hand
From the first opening bud, and gave ye names!
Who now shall rear ye to the sun, or rank
Your tribes, and water from the ambrosial fount?'

The eglantine is often spoken of by the poets: in that exquisitely-musical poem, 'L'Allegro,' Milton tells of hearing the lark

'Through the sweet brier, or the vine,
Or the twisted eglantine;'

confounding the latter with the honeysuckle: but eglantine is the old English name for the sweet brier rose. Spenser says—

'Sweet is the rose, but grows upon a brere;
Sweet is the eglantine, but pricketh nere.'

And Shakspeare has interwoven it with other floral favourites in the lines—

'I know a bank where the wild thyme blows,
Where oxalips and the nooding violet grows.
Quite over-canopied with luscious woodbine,
With sweet musk roses, and with eglantine.'

We are indebted for the jessamine to the warm south: the double variety of this delicate flower was so highly prized on its first introduction into Italy from Spain, that the governor of Pisa kept a sentry constantly on

guard over the plant. 'Luxuriant above all,' writes Cowper—

'The jasmine, throwing wide her elegant sweets;
The deep dark green of whose unvarnished leaf
Makes more conspicuous, and illumines more
The bright profusion of her scattered stars.'

Cowley, who entertained a poet's love for the beauties of nature, inquires—

'Who that has reason, and his smell,
Would not among roses and jasmine dwell,
Rather than all his spirits choke
With exhalations of dirt and smoke?'

The writings of Spenser abound with allusions to flowers, often so beautifully interwoven with the subject, as to render quotation difficult. When Sir Guyon steps ashore with the lady on the beautiful isle—

'The fields did laugh, the flowers did freshly spring,
The trees did bud, and early blossoms bore.'

And in his poem of 'The Gnat,' how skillfully he represents the shepherd at the tomb, where

— 'Round about he taught sweet flowers to grow;
The rose ingrained in pure scarlet dye;
The lily fresh; and violet below;
The marigold; and cheerful rosemary;
The Spartan myrtle, whence sweet gum does flow;
The purple hyacinth; and fresh costmary;
And saffron, sought for in Cilician soil;
And laurel, the ornament of Phebus's toil.'

And again, in one of his sonnets, after comparing his lady to the most goodly flowers, he ends by saying, 'but her sweet odour did them all excel.'

It is not with flowers as with works of art, or the toys of fashion: the most costly are not always the most esteemed. The humble daisy, as we have seen, flourishes in the writings of the first of poets; so another of our spring visitants has been set in verse. Shakspeare makes of the 'cowslip's bell' a fitting lurking place for Ariel; and the fairy says of her queen, in reply to Puck—

'The cowslips tall her pensioners be,
In their gold coats spots you see;
Those be rubies, fairy favours;
In those freckles live their savours:
I must go seek some dewdrops here,
And hang a pearl in every cowslip's ear.'

The cowslip, too, appears among other flowers in 'Comus;' and Herrick in the 'Meadows' tells how maidens

'With wicker arks did come,
To kiss and bear away
The richer cowslips home.'

In 'The Picture,' a poem by Hughes, a writer seldom quoted, we read—

'So from every flower and plant
Gather first the immortal paint.
Fetch me lilies, fetch me roses,
Daisies, violets, cowslip-poesies.'

Who that has travelled, has not remarked the cottage gardens which border, at frequent intervals, the highways and byways of England? These mark the taste of their owners; and wherever a love of flowers prevails, we may reckon upon finding a certain degree of refinement and gentleness of character. Flowers, whether wild or cultivated, are the most graceful and impressive among nature's humanising influences; and many a weary heart has acknowledged their soothing power, and learned wisdom from their mute yet eloquent teaching. Shakspeare wrote—

'The rose looks fair; but fairer we it deem
For that sweet odour which doth in it live.
The canker-blooms have full as deep a dye
As the perfumed tincture of the roses,
Hang on such thorns, and play as wantonly
When summer's breath their masked buds discloses:
But, for their virtue only is their show;
They live unwooded, and unprotected fade:
Die to themselves. Sweet roses do not so;
Of their sweet deaths are sweetest odours made.'

It is easy to understand how the Tulipomania may have originated in the enthusiasm of some devoted cultivator of flowers. He had tended and watched them so long, that at last he knew not where to set a limit to their value. Nature speaks to the heart in a thousand ways, giving rise to emotions as various: the same objects will excite joyousness, melancholy, pleasure, and pain, hope and despondency, according to the state of mind of those to whom they are presented. Thomson has a beautiful passage—

'Fair-handed spring unbosoms every grace;
Throws out the snowdrop, and the crocus first;
The daisy, primrose, violet darkly blue,
And polyanthus of unnumbered dyes;
The yellow wallflower stained with iron-brown;
And lavish stock that scents the garden round:
From the soft wing of vernal breezes shed
Anemones; auriculas enriched
With shining meal o'er all their velvet leaves;
And full ranunculus of glowing red.
Then comes the tulip race, where beauty plays
Her idle freaks:
No gradual bloom is wanting; from the bud,
First-born of spring, to summer's musky tribes:
Nor hyacinths, of purest virgin white,
Low bent, and blushing inward; nor jonquills,
Of potent fragrance; nor Narcissus fair,
As o'er the fabled fountain hanging still;
Nor broad carnations, nor gay spotted pinks;
Nor, showered from every bush, the damask rose,
Infinite numbers, delicacies, smells,
With hues on hues expression cannot paint,
'The breath of nature, and her endless bloom.'

A LADY'S CONSOLATION.

EVERYTHING goes by comparison. A man brought from a dungeon into the morning twilight, will think himself in the midst of noonday; and, for aught we know, the travelling miseries of Mrs Butler may to her be absolute consolation.* It is said that a sailor is fated to eat a peck of dirt during his life, but that allowance is nothing to hers in her consolatory year. She sets out, in fact, by asserting her belief that England is the only place in the world where the people are not disgustingly dirty, and that 'exceedingly few people are clean there.' As for the French, they would not permit her to be clean even in her own person; giving her, in the best hotels of Paris, a cream-jug for a water vessel, a pudding-bowl for a basin, and not so much warm water as would suffice for 'the youngest gentleman shaving the faintest hopes of a beard.' On leaving Paris for Marseilles, she was still worse off, getting into a 'filthy inn, crowded with men in blue blouses and black muzzles; and thence into a diligence 'with the head and tail cut off,' where her maid lay down in the straw at the bottom, and where the seats were so contrived, that it was impossible to sit on them without sliding off every five minutes.

But even here she was not allowed to indulge herself, being ejected at midnight, 'to her intense dismay and indignation,' and sent into the inn at Château Chinon, 'the most horrible cut-throat-looking hole she ever beheld.' It was dirty of course, and the serving-girl dirty too, as well as sleepy and stupid, poor thing, at such an hour. The kitchen (into which, in France, travellers always make their way from the road) was black and filthy; and a gentleman had two abominable dogs, which kept running about, and all but knocking her down; so that, taking things upon the whole, poor Mrs Butler was 'so terrified, disgusted, and annoyed, that she literally shook from head to foot.'

But in the bedroom she was out of the frying-pan into the fire—or rather into the smoke, for the storm took

the liberty of coming down the chimney. The floor was covered with filth and dirt, to the thickness of one inch: the very sky, seen through the window, was black. The postmaster had likewise black hair, besides being a reprehensibly ill-looking individual, with only one eye, and marked with the small-pox. Yet with this fright she was doomed to travel, in a crazy, dirty, rickety sort of gig, the seat of which, stuffed with hay, resembled a manger. The next vehicle was a 'huge nuisance' of a diligence, already possessed by four lumbering men; and the atmosphere of a snuffy German, a Frenchman reeking of stale cigar smoke, one or two India-rubber cloaks, and all their respirations, was really atrocious. In the next there was a man who was so uncivil as to be fat and elderly, and to have a threatening of gout and a terror of cold. A country-woman they met on the road wanted to join them in the full inside; but the Frenchmen were so revoltingly selfish, as not to get out to accommodate her. Among many hundreds of people going to a fair, they saw only one good-looking girl.

At Lyons, the fair traveller was shamefully fleeced in the hotel, and not allowed to wash herself even so well as at Paris. On arriving at Marseilles, her fellow-travellers went off *without taking leave of her*: an eloquent fact, that gives rise to some severe strictures on the national degeneracy. While waiting her departure for Genoa, she amused herself with the appearance of her fellow-passengers. 'A cargo came on board of two clean, cross-looking men, and four veiled women, who began stumping up and down the deck, each on her own hook, betraying, in the very hang of their multitudinous shawls, the English creature—how peculiar they are, to be sure!' At length she found herself bowling on to Rome in a crazy, rickety, dusty, dirty, ragged, filthy conveyance, into which she had 'clomb by three horrid hoes, that scraped her shins to death,' and was fairly set down in 'the dark, deep, dismal, stinking streets' of the city of the past.

This is not an overcharged account of Mrs Butler's journey from Paris to Rome; in which, notwithstanding, are exhibited much talent, fancy, and power of description. With a very common blindness, she relates an anecdote which reads like a satire on herself. 'We have just made an expedition to Tivoli,' says she, 'which was highly prosperous till its very close. Directed by — to one inn in preference to the rival establishment, we repaired to the Queen of England, and found her most gracious majesty dark, dingy, dirty—in short, indescribably dreadful; but, however, thanks to some omnipotent charm, which we, alas! had not, — had found sweet smells and savoury food, and sunny sights, while our experience was—of dirt to eat, dirt to drink, and dirt to sleep in.'

Having thus hinted—with comparative mildness—that our fair author, in spite of the title of her book, does not derive from foreign travel that 'consolation' it is fitted to bestow upon well-regulated minds, we must, in justice to her, turn the reverse of the medal. The scene is in Rome.

'Now for the chapter of compensations: my bedroom door and window opened upon a terraced garden at least forty feet above the street, full of orange and lemon trees, magnolias, myrtles, oleanders and camelias, roses and violets, in bloom; a fountain of the acqua felice trickles, under the superintendence of a statue, into a marble shell, and thence escapes under the garden. The view from thence of the eternal city and its beautiful girdle of hills surpasses all description, and the twin towers of the Trinità rise close to it up into the blue sky, which looks through the belfry arches as through windows down into my sleeping-room. The coloured tiles of all our anterooms and passages enchant me; so do the gay-painted ceilings. The little room where I bathe is a perfect delight to me, with its Latin inscription on the lintel, its marble bath, its walls covered with fresco Cupids and dolphins, and altars with flames, and baskets with flowers, all strung together by

* A Year of Consolation. By Mrs Butler, late Fanny Kemble. 2 vols. London: Moxon. 1847.

waving patterns of wreaths and garlands. This afternoon we drove through the streets of Rome, out to a place that was once one of the innumerable Cenci possessions, but which is now a farmhouse of the Borghese. In one corner of the littered stable-yard, where heaps of manure occupied most of the ground, stood a stone sarcophagus, with spirited and graceful rilievi, into which fresh water was pouring itself in a glassy stream. As we went round the house, we came upon another stone basin, of beautiful form and proportions, into which another gush of living water was falling in the bright sunshine: farther on, again, beneath a sombre avenue of ilex, another of these precious reservoirs sparkled and gleamed. I cannot describe my delight in living water: these perpetually-running fountains are a perpetual baptism of refreshment to my mind and senses. The Swedenborgians consider water, when the mention of it occurs in the Bible, as typical of truth. I love to think of that when I look at it, so bright, so pure, so transparent, so temperate, so fit an emblem for that spiritual element in which our souls should bathe and be strengthened, at which they should drink and be refreshed! Fire purifies, but destroys; water cleanses and revives. Christ was baptised in water, and washed, himself, in the regenerating element, his disciples' feet. He promised living waters to all those who, thirsty, drew near to him, and spoke of that well of everlasting life, which those to whom he gave to drink possessed for ever in their souls. I do not wonder at all the marvellous *wasser-cure* reports. I believe the material element to be as potent in regenerating and healing the body, as the spiritual element its clearness dimly represents is to regenerate and heal the mind.

'It is impossible to describe the soft beauty of everything that surrounded us here; the ilex-trees, the graceful stone pines, the picturesque colour and outline of the house itself, the sunny far-stretching campagna, with its purple frame of mountains; Soracte, standing isolated like the vanguard of the chain; the sullen steeps of the Sabine; the smiling slopes of the Alban hills; Frascati, Tivoli, glittering in the sunshine, on their skirts; the light over all radiant and tender; the warmth and balmy softness of the atmosphere—everything was perfect enchantment. Everything was graceful, harmonious, and delightful to the eye, and soothing beyond expression to the mind. Presently came two of the beautiful mouse-coloured oxen of the campagna, slowly, through the arched gateway of the farm-yard, and, leaning their serious-looking heads upon the stone basin, drank soberly, with their great eyes fixed on us, who sat upon the hem of the fountain; I, for the first time in my life, almost comprehending the delight of listless inactivity. As the water ran lullingly by my side, and between the gray shafts of the tall pine-trees, and beneath the dark arches of their boughs, the distant landscape, formed into separate and distinct pictures of incomparable beauty, arrested my delighted eyes. Yes, I think I actually could be content to sit on that fountain's edge, and do nothing but listen and look for a whole summer's afternoon. But no more: "Up, and be doing," is the impulse for ever with me; and when I ask myself, both sadly and scornfully, What? both my nature and my convictions repeat the call, "Up, and be doing;" for surely there is something to be done from morning till night, and to find out what is the appointed work of the onward-tending soul.'

The following specimen will likewise give a favourable idea of the descriptions which form the staple of the work. 'Soon after our arrival, donkeys were procured, and we started on the usual giro of the valley, beginning our pilgrimage at the Villa d'Este, where we sat by fountains falling in this lovely solitude, and gathered branches thick with orange blossoms, and looked from crumbling princely terraces over the glorious campagna, and heard—in a sort of dark chamber of cypress-trees, with the red buds of delicate China roses blooming at their feet—the loud sweet singing of a fearless

nightingale. Thence we proceeded to what is called, by those who know, Mæcenas's Villa; and by those who know better, the Temple of Hercules. I, who neither know, nor know better, saw a fine collection of extensive iron forges, a species of place that I have the greatest delight in, because of their picturesque black chambers, and fiery furnaces, and sooty population, all which we had in great perfection here; for after walking out on the huge noble roof that juts like a promontory over the glen, its sides all garlanded with young verdure, amidst which the milk-white cascade went rolling in round fleecy ropes down the steep cliff, we descended to visit the valley, passing through the iron-works—through dark passages, where the sound of rushing waters rolled above our heads, and where some sudden furnace-gleam betrayed them hurrying fast beneath the planks under our feet. Huge bellows and hammers, wielded by the subject elements, resounded with deafening clangour through the black vaults. Presently we passed deep-glowing furnaces, from one of which a long bar of iron, that had writhed itself crooked in the intense heat, was drawn out, and thrown like a red snake upon the ground; close to those toiling fires sprang up white sheets of toiling water, wrestling with powerful wheels, that they lashed till they turned the appointed way; and sweating, begrimed, sooty—smaller than the smallest part of this vast machinery, and weaker than its weakest—stood in the midst of these, his bright powerful slave, the mighty task-master—man. Leaving these Vulcanic regions, we descended a steep path, through vineyards, where the vines, instead of being cut short and fastened in little stacks to reeds a few feet high, are spread all over trellises—a mode of training them, disadvantageous, it is said, to the grapes, but which produces a very pleasant appearance, and looked down upon from above, has the effect of a sort of false-bottom to the whole country—that which seems the verdant ground being nothing but the vine-covered trellis that hides it. The whole valley, as we wound round it, was exquisitely beautiful, and we paused by some golden tufts of broom opposite the cascade to enjoy the view. . . .

'As we wound down the steep paths to the cavern, the trees through which we passed glittered all in the rain that still rested on them, and added much to the beautiful effect of the shadowy procession moving in torchlight through the surrounding gloom, and descending, apparently, into the very bowels of the earth. Arrived at the bottom of Neptune's Cave, which is the top of the Syren's Grotto, all sorts of illuminations took place. Bundles of hay were piled beneath the rocky arch, below which the waters disappeared, and being set fire to, the sudden light sent a blood-red flare deep down into the gulf and upon the foaming waters. Wreaths of burning straw were floated down into the abyss, whose darkness swallowed them instantly; the rocky roof and eager forms and faces of the assistants, and terrified leaping wild waters, all being suddenly illuminated by the strong light only for a few seconds. Then fires were lighted half-way up the glen in a sort of rocky gallery, with open arches looking down into the deep. Here, as we stood below and opposite, we saw the men who were employed in lighting these fires run to and fro through the ruddy rock passage: the effect was perfectly infernal; and nothing but demons, or some religious rites, such as men have devised for themselves, and which are fit only for devils, were suggested by this strange spectacle. Then the red flaring fires were extinguished, and a pale white chemical light was made to pour its radiance into the rocky cup, at the bottom of which we stood.'

Mrs Butler devotes considerable space to a description of the carnival, and it is no small praise to her to say, that she has contrived to render readable even so threadbare a subject. The following is the conclusion:—"I believe I have nothing more to say of the carnival, but to notice the closing-in of the last evening, when, as the daylight grew thick, suddenly a thousand

tapers from the street, the carriages, the windows, the balconies, the house-tops, shone out upon the dusky twilight. The Corso looked like a whole street full of fire-flies; everybody carried in their hands a sheaf of small wax tapers, and the swarming sparks in a burning piece of paper, or an assembly-general of all the *ignis fatui* in the world, or the Milky Way suddenly fallen from the sky into the Corso, are the only things I can compare this wonderful and beautiful spectacle to. Far down the thronged irregular thoroughfare, this magical illumination flickered and twinkled; the street was alive with light; the carriages formed little clusters or constellations of burning tapers; from the projecting parts of every house the little moccoli were held aloft; sticks, with lights fastened to them, were pushed far out from the very tops of the houses, like strings of strange stars up against the violet-coloured evening sky; little boats of green and red oiled silk, with burning tapers in them, were set afloat in the air, and came flickering down like showers of illuminated flowers into the street. No words can convey any adequate idea of the brilliancy and singularity of the spectacle. In the meantime the sport consisted, not in the beauty and strangeness of the sight, but in everybody's endeavouring to extinguish everybody else's light, and keep his own from being extinguished. This, which might be supposed a satirical representation of society, was carried on with a frantic activity irresistibly ludicrous to a looker-on. We had gone to our balcony, the better to enjoy the *coup d'œil*; and anything more magical, more fairy-like, and more devilish at the same time, cannot be conceived: pocket-handkerchiefs, sticks with little flags tied to them, wisps of paper, and all imaginable weapons, were used to put out the little moccoli; extinguishers of oiled paper or parchment, fastened to long sticks, were in great requisition, and everywhere the little tapers burned and flamed, and were blown out and relighted, while screams of laughter, and shouts of "Senza moccolo—senza moccolo!" resounded from one end of the street to the other. For a while I remained intent upon preserving my light from extinction, but the blows and blasts aimed at it from above, below, and all round, rendered it impossible; and finding that this individual care for my own luminary was depriving me of the curious spectacle, I put mine out once for all, and gave myself up to gazing at the comic rout all round. At length we retreated from our stand, and threading our way through the crowd, regained our carriage. Immediately on leaving the Corso, all seemed dark and still; and though the blaze still streamed partly up some of the side streets communicating with it, and the confused uproar followed us like the sound of a distant beach some way after we had turned homewards, when we reached our own serene height on the Pincio, not a sound was to be heard but our own carriage-wheels, nor a light seen but the everlasting stars of heaven, which seemed to look down in quiet supremacy and an easy consciousness that they were not soon likely to be flapped out.*

Throughout the volumes are sundry strictures on the dishonest charges of continental innkeepers and shopkeepers, together with some ridicule of the extravagance of the English. For our own part, though tolerably well acquainted with the countries alluded to, we must confess we never happened to meet with a single specimen of this extravagance. The great majority of English residents abroad have not one shilling to spare; while English travellers, rich and poor alike, appear to live in constant dread of imposition, and to have set out with the most absurd notions of what are fair charges. On the coach highways in France, for instance, a man dines on soup, fish, meat, poultry, game, asparagus, cauliflower, haricot beans, pastry, and a plentiful dessert—the last always including (to the amusement of the Englishman) cheese; and throughout the meal he has bread and common wine at discretion. For this he is charged three francs (half-a-crown), and complains bitterly of the imposition; while at home, under similar

circumstances, he pays the same sum, without scruple, for his share of a single joint, with cheap vegetables, bread and cheese, and a glass of table-beer. Upon the whole, we must say that we have met with more instances of meanness among the English abroad, than of extortion among the natives.

GOLD IS EXPORTING—MONEY WILL BE SCARCE.

In an able paper of the 92d number of the *Westminster Review* (entitled 'Postscript'), there occur some remarks on the monetary crisis, which have to us a supernumerary interest, in as far as they support a view taken by ourselves in a paper entitled 'The Metaphysics of Business,' which appeared in the 74th number of the *Journal* (new series). The subject is well worthy of being taken to heart by the guiding minds of our community.

'The financial embarrassment and monetary crisis through which we have passed, and which have appeared immediately to result from the Irish measures of government, may in part be traced to the currency delusions, upon which we commented in a former paper—delusions still popular with the editors of city articles, although of late exposed by some of the ablest thinkers of the day. We allude chiefly to the doctrine, both of the bullionists and the Birmingham philosophers, that commercial transactions, and the prices of commodities, are governed by the quantity of money in circulation, as represented by gold and paper. The text of the alarmists is now the drain of gold:—"Gold is being exported to pay for corn; more gold will be exported; money will be scarce; all kinds of property will fall in value; prepare for ruin."

'The time will come when the prevailing notion that the prosperity of nations depends upon the question, whether a ton weight of gold shall lie buried in a vault in Hamburg or a vault in London, will be classed with the chimeras of the nursery. That such an idea should still be cherished, will hereafter appear the more strange, since to all men the fact is palpable, that the use of gold or notes has long been practically superseded by accounts and cheques; that what is called the currency of the country is, in fact, only the small change of society, and an element absolutely insignificant in the vast transactions of a commercial people. The balances adjusted in the London clearing-house of £3,000,000 per day, afford an indication that we should be quite within the mark in asserting that £100,000,000 per day would often inadequately represent the property actually transferred from one to another, or the real daily business done in buying and selling by the whole population of the British empire. In but few comparatively of these transactions is the actual passing of either gold or notes from hand to hand required. The great majority are effected by figures, placed on the debtor or credit side of an account. A metallic currency belongs to a state of society (one of semi-civilisation) which is passing away; and it is not true that notes have replaced it—the modern medium of exchange is a ledger.

'Yet we are told that a handful of gold, or Bank of England notes, disappearing from the circulation, has the power to affect, by an extreme depreciation, the whole property of the United Kingdom! What is certain is, that the realisation of these prophecies generally follows the predictions; but it is most important the public should understand that they lead to their own fulfilment; a fact beginning to be suspected, and of easy demonstration.

'Value is governed by supply and demand; but supply and demand are governed by opinion. Faith is necessary to the husbandman: he must have confidence in the seed he is to put into the ground, or it will not be sown. Faith is necessary to the merchant: he must have a reasonable prospect of a market, or no vessel will be sent by him to a distant port. All buying and selling, not designed for immediate consumption, is regulated by belief—that is, by the opinion of the buyer and seller that prices will rise, or that they will fall, or that they will remain stationary. All are buyers when there is a hope of profit; all are sellers when there is a prospect of loss: hence the fluctuations

* The anticipation of a continued drain of gold will, perhaps, be somewhat modified by the information, derived from official sources, and communicated to the public by Mr Frederick Soeber, that the Siberian gold mines are annually increasing in productiveness. The produce, in the year 1846, was 1722 pounds, 39 li., 87 sol., surpassing, by 336 pounds, 28 li., 46 sol., the produce of 1845. A pound is equal to 36 lbs.

of the funds and of the share markets, which have literally nothing whatever to do with the permanent security for investment of any of the stocks quoted; and are certainly never affected, to any perceptible extent, by a difference in the quantity of money. The prices of share lists indicate nothing but the fears or confidence of holders. Create a belief that money will be scarce, and you produce the same effect as if money had suddenly vanished from the world by a miracle, and were really that indispensable medium of exchange in large commercial transactions which, as we have shown, it is not. With the cry—"Gold is going out—money will be scarce," all prudent men begin at the same time to contract their obligations, to call in their debts, and to make reserves. Hence, and hence only, a pressure, for which the shipment of a box or two of bullion, and the withdrawal of a few bundles of bank-notes from a banker's drawer, can never adequately account.

'The loss arising from the failure of the potato crop is said to be £16,000,000. How much per cent. is that upon the fixed and floating capital of the British empire, usually estimated at £5,000,000,000? Less than 6s. 6d. Why, then, if in consequence only of such an insignificant diminution of our exchangeable commodities, have we seen, within the last six months, a fall of £10 per cent. in the most solid securities in the kingdom—the funds, and the shares of the North Western Railway Company? Potatoes were innocent of this extreme depreciation. The shipment of £3,000,000 of bullion could not have occasioned it: want of confidence alone was the cause. Belief in a falling market, produces a falling market; because all are sellers at the same moment, and no buyers. A few years back, there was a belief in the minds of some hundreds of ignorant and credulous persons that London would be destroyed by an earthquake. There was no earthquake; but they had hastened to fly into the country.'

TERRACE CULTIVATION IN CHINA.

The terrace cultivation of China has been noticed by nearly all writers upon this country; and like most other subjects, it has been either much exaggerated, or undervalued. It appeared to me to be carried to the greatest perfection on the hill-sides adjacent to the river Min near Foo-choo-foo; at least I was more struck with it there than anywhere else. On sailing up that beautiful river, these terraces look like steps on the sides of the mountains, one rising above another, until they sometimes reach six or eight hundred feet above the level of the sea. When the rice and other crops are young, these terraces are clothed in luxuriant green, and look like a collection of gardens among the rugged and barren mountains. The terrace system is adopted by the Chinese, either for the purpose of supplying the hill-sides with water where paddy is to be grown, or to prevent the heavy rains from washing down the loose soil from the roots of other vegetables. Hence these cuttings are seen all over the sides of the hills, not exactly level like the rice terraces, but level enough to answer the purpose of checking the rains in their descent from the mountain. For the same reason, the sweet potato, and some other crops which are grown on the hills, are always planted in ridges which run cross-ways or horizontally; indeed, were the ridges made in a different direction, the heavy rains which fall in the early summer months would carry both the loose soil and crops down into the plains. Rice is grown on the lower terrace ground; and a stream of water is always led from some ravine, and made to flow across the sides of the hills, until it reaches the highest terrace, into which it flows and floods the whole of the level space. When the water rises three or four inches in height, which is sufficiently high for the rice, it finds vent at an opening made for the purpose in the bank, through which it flows into the terrace below, which it floods in the same manner, and so on to the lowest. In this way the whole of the rice terraces are kept continually flooded, until the stalks of the crops assume a yellow ripening hue, when the water being no longer required, it is turned back into its natural channel, or led to a different part of the hill, for the nourishment of other crops.—*Fortune's Wanderings in China.*

INCrustATIONS ON STEAM-BOILERS.

The 'Times' makes an important announcement of the complete success of a plan for preventing incrustations on the boilers of steam-engines. The water employed to be converted into steam, as is familiarly known to every one

who uses a tea-kettle, leaves an incrustation on the vessel—carbonate of lime. This is a source of great danger with boilers, causing explosions, 'by forming a layer of non-conducting matter between the metal and the fluid to be heated, and thus allowing the temperature of the former to rise to a high point, even to redness. The metal oxidises rapidly at this temperature, and the boiler is thereby weakened and rendered incapable of sustaining the necessary pressure. But a more fruitful cause of accidents, is the sudden removal of portions of incrustation, when the metal expands on the attainment of the high temperature; the water is thereby brought in contact with the heated metal, and evaporation takes place so suddenly, as to resemble the evolution of gases from the firing of gunpowder. Indeed the results in both cases are identical.' To avoid this peril as far as practicable, the water, when it becomes dense, is frequently 'blown off,' or driven out of the boiler. But this is only a partial remedy, and the crust has to be removed by means of the hammer and chisel, to the injury of the vessel. About two years ago, Dr Ritterbandt discovered a cure for this. He found that, 'by introducing muriate of ammonia into a boiler containing water holding lime in solution, the carbonate of lime, instead of depositing when the carbonic acid by which it was held in solution was expelled at a high temperature, became converted into muriate of lime, a substance eminently soluble; while the carbonate of ammonia, likewise formed by the double decomposition, passed off with the steam, so that the boiler could not foul. The process is equally applicable to fresh and salt water.' It has also resulted in dissolving the crust formed before its application. It is still necessary to blow off the water occasionally, but only to the extent of one-fourth of what is requisite without Dr Ritterbandt's invention. The 'Times' has tried the plan on its own boilers, and a twelvemonth has fully proved its efficacy.

THE PERSIAN PEASANT.

Where the effects of war have not been felt, and the hand of oppression has not fallen heavily, the situation of the Persian peasant is not uncomfortable. His house, though built of mud, is warm, and may be clean; and he can always spread a carpet, or felt nurmuds (the work, probably, of the women of his own family), on the floor of his best room, for the accommodation of a guest. He is comfortably clad in cotton or woollen cloth of home manufacture, or purchased with his own produce from the nearest bazaar. The fleecy skins of his own sheep afford him a warm covering in winter, and a cap of the national shape for his head. His wife and children are equally well clothed. Silk handkerchiefs, European or native printed calicoes, stout home-grown and home-made cottons, compose the apparel of the former, who, as well as the children, and especially the girls, exhibit many coins and ornaments of silver about their persons. His family fare is generally frugal: good wheaten bread, in long thin flaps, cheese, sour milk, honey, grape-tracae, herbs and vegetables—such as onions, radishes, beetroot—and some eggs occasionally; or a little meat, stewed or roasted in small pieces, or made into soup with a sort of pea or vetch, into which the bread is broken; and sometimes a pillau of rice well buttered, or with meat, and a few plums and raisins by way of feast; fruits in their season, or preserved by being dried; rice, or flour and milk, boiled with sugar into a sort of porridge: these things form nearly the whole of the peasant's bill of fare for the year round; but when a stranger of any consequence arrives, there are few respectable villages that cannot furnish him with a meal that leaves no cause for complaint, even though his cook be the wife of a peasant.

CARE OF ANIMATE AND INANIMATE MACHINES.

Independently of men being sentient beings and fellow-creatures, they may also be considered as indispensable mechanical instruments. But in former times they had not the attention paid to them which would have been due even to inanimate machines of equal utility; for there seemed to be much more anxiety about preserving arms from rusting, and cordage from rotting, than about maintaining men in an effective state of health.—*Sir Gilbert Blane on the Comparative Health of the Navy.*

FORGETFULNESS.

EVERYBODY trumpets the advantages of a good memory. Plans for cultivating it, or supplying its deficiencies by artificial means, make a great figure in 'Watts on the Mind,' and other slender-witted well-meaning books. Grave middle-aged people shake their heads to little boys, and tell them there is nothing like **MEMORY**. *With that*, all comes easy; *without it*, nothing is to be done. And so Memory keeps up a tremendous character in the world—has always done, and will continue to do so. Nobody in the meantime thinks of saying a word in praise of Forgetfulness. Yet is Forgetfulness a blessed thing too, although, no doubt, in a different kind of way. The one is a noted source of positive good, in as far as it is intellectual power and wealth. So far well. The other, while a source of certain positive evils, in as far as it engenders ignorance, and leads to neglect, is only attended by negative benefits. Thus may the different reputations of the two things be accounted for. Nevertheless, it is clear as noonday, or any other very clear thing whatever, that we owe as much to Forgetfulness as to Memory, and that it is as much a duty to cultivate the one as the other.

We should be ready to forgive, say all the good ethical codes. 'Well, I forgive,' cries the wronged or affronted man; 'but I cannot forget.' How unfortunate!—seeing that, while he cannot forget, he has not forgiven; he only thinks he does. Forgetfulness is necessary to this solemn duty: it is vain to think of doing without it. But let us not speak of duty, but only of the comfort of having nothing to complain of or avenge. How blessed for the man himself, if—having undergone an injury or a mortification—he only can forget! Then, truly, is the good thing insured: forgetting, he has no occasion to think of forgiving; it is the major proposition containing the minor within itself. Happy, happy, thrice happy he who simply has not a Memory for his wrongs or his sufferings! Happy the mind which, like water, may be lashed into foam, and in an instant will resume the placid smile in which it reflected heaven—compared with that obdurate one which may be said to resemble the marble tablet—let it be struck with the same force, and it lies in hopeless ruins for ever!

Misfortunes occur and gall us. We meet disappointments, and for the time are wretched. Frantic, and darkly groping, the mind roams about its little world-prison in search of consolation. Something of the kind is encountered and grasped at, and the crisis passes. But how must we all acknowledge that, in the long-run, the true and perfect consoler was Forgetfulness! What pains have been suffered on this earth from first to last! How sad have hearts been, sitting by the firesides of five thousand years ago! How has human life

been in all times a synonyme for wo! But all is hushed up and buried under this very surface which, when I look abroad upon it in the sunlight of May, laughs in the joy which great God has sent down upon it. Thus it is with our daily existence. We walk enjoyingly each moment on a mental sward of freshest verdure, composed of the trodden-down hopes and extinguished joys of the past. Blessed, blessed is this moral chemistry which works so well! Could all of these lost hopes and joys revive before our eyes, and look as they once looked, it would be suffering too great for poor humanity. We are happy on the express condition that we forget.

Perhaps it might admit of question, if history is the unmixed good it is usually thought to be. It gives to nations and other bodies of men long Memories, which it were better for them to want. The great public criminalities of the past—such as the settlements in Ireland, the Smithfield Burnings, the Partition of Poland—it may do some good to remember them as errors to be avoided, but it seems a pure evil for the descendants, or the party of the sufferers, to keep these things in mind. They cannot now be remedied—not even revenged. It only keeps alive bad feelings to remember them—exasperation to those interested in the injured; vexation, without correction, to those who represent the injurers. Could they be entirely forgotten, the present generation might better exemplify the Christian precepts. On a serious reflection, the making holidays of the anniversaries of the great treason of 1605 and the death of Charles I., appears as the most deliberately wicked conduct of which a people or a party could be guilty—determining to remember injuries by statute—consecrating offences to all time—howling out 'I wont forget!' even after there is no one against whom the remembrance is a stigma, which is the case with the 'Martyrdom.' We only do not at once condemn and abolish such practices, because seriousness has actually long ago departed from them, leaving them only as empty mockeries or childish sports. War, wholly, might be better forgotten. Its Memories tend continually to make more war, less by encouragement to victors, than mortification to the vanquished; for a Waterloo may sooner cease to be boasted of than to be resented. Could the horrid story, and all its tangible memorials in soldiery, artillery, fortresses, bellicose songs, pass at once from remembrance, the chances of a renewal of hostilities would be greatly lessened. Would that all who have ever warred, and particularly those who have been worsted, could forget!

Memory is directly useful, Forgetfulness indirectly or negatively so. We might have had more of the one, if it had not been necessary that the other should also have its share of us. When disposed to lament a failure or deficiency of Memory, let us remember that, had

more been given to humanity, sorrow would have had more power over it. The limitation thus given to our knowledge is likewise the limitation of our pangs. We pay, in oversights which occasion much trouble, for the speedy replacement of sighs by smiles. A beautiful compromise it is in our nature, which gives us Memory to preserve past ideas, and enable us to accumulate them in the mind, yet at the same time plants a principle by which the seams of care are obliterated, and the machine continually re-arranged for new and happy experiences. From none but a Divine Source could have come a decree so beneficent towards us mortals—making us feel as if Heaven itself rocked the cradle of our life, dried our tears, and hymned us into rest. Poor children we are all—mere breath that has come from the true Source of Power. Oh, let us keep ever in view, as essential to one of the greatest maxims sent us thence, besides being needful to our deliverance from all trouble, that there is nothing like this—**TO FORGET!**

SIR GEORGE SIMPSON'S OVERLAND JOURNEY ROUND THE WORLD.

AN overland journey to India is performed by sea, with the exception of the narrow Isthmus of Suez; but an overland journey round the world is a vastly different thing. In the latter, the traveller traverses three continents—Europe, Asia, and America—and crosses the Atlantic and Pacific Oceans. But Sir George Simpson, in addition to this, paid a flying visit to the Sandwich Islands, in the middle of the North Pacific, and coasted along the opposite American shores for a distance of some 25 degrees. The idea of such a journey bewilders the imagination. The exploits of the circum-navigators seem nothing in comparison; and one feels disposed to place Sir George at the head of all adventurers of his class. But when we remember, as remember we must, the changed circumstances of the world even since the most recent of preceding expeditions—when we find that 'our hero' traversed the two oceans by means of steam—that he found the savages of America tamed at least into submission—the murderers of Cook a comparatively civilised and somewhat luxurious people—and the deserts of Siberia the track of a regular commerce—our surprise diminishes, while our interest increases. In fact, we know of no book more suggestive than the one before us of proud and elevating thoughts—more conclusive, when taken as a whole, of the rapid advancement of mankind in their glorious but indefinite career.*

Sir George, accompanied by some other gentlemen connected with the service of the Hudson's Bay Company, left Liverpool on the 4th of March 1841, and on the 20th arrived at Boston. From Montreal he embarked on the *St Lawrence* in light canoes, with the Earls of Caledon and Mulgrave, who visited the wilds of America to enjoy the amusement of hunting. The nature of this part of the route may be collected from the following picturesque description:—'To begin with the most important part of our proceedings—the business of encamping for our brief night—we selected, about sunset, some dry and tolerably clear spot; and immediately on landing, the sound of the axe would be ringing through the woods, as the men were

felling whole trees for our fires, and preparing, if necessary, a space for our tents. In less than ten minutes our three lodges would be pitched, each with such a blaze in front, as virtually imparted a new sense of enjoyment to all the young campaigners, while through the crackling flames were to be seen the requisite number of pots and kettles for our supper. Our beds were next laid, consisting of an oil-cloth spread on the bare earth, with three blankets and a pillow, and, when occasion demanded, with cloaks and greatcoats at discretion; and whether the wind howled or the rain poured, our pavilions of canvas formed a safe barrier against the weather. While part of our crews, comprising all the landmen, were doing duty as stokers, and cooks, and architects, and chambermaids, the more experienced voyageurs, after unloading the canoes, had drawn them on the beach with their bottoms upwards, to inspect, and, if needful, to renovate, the stitching and the gumming; and as the little vessels were made to incline on one side to windward, each with a roaring fire to leeward, the crews, every man in his own single blanket, managed to set wind, and rain, and cold at defiance, almost as effectually as ourselves.

'Weather permitting, our slumbers would be broken about one in the morning by the cry of, "*Lève, lève, lève!*" In five minutes—wo to the inmates that were slow in dressing!—the tents were tumbling about our ears; and within half an hour the camp would be raised, the canoes laden, and the paddles keeping time to some merry old song. About eight o'clock, a convenient place would be selected for breakfast, about three-quarters of an hour being allotted for the multifarious operations of unpacking and repacking the equipage, laying and removing the cloth, boiling and frying, eating and drinking; and while the preliminaries were arranging, the hardier among us would wash and shave, each person carrying soap and towel in his pocket, and finding a mirror in the same sandy or rocky basin that held the water. About two in the afternoon we usually put ashore for dinner; and as this meal needed no fire, or at least got none, it was not allowed to occupy more than twenty minutes or half an hour.'

Their course through Lake Superior was to some extent impeded by ice; but they at length arrived at Fort-William, at its extremity, and exchanged their vessels for two smaller canoes, better adapted for the shallower and more intricate river navigation that was to follow. The following is a picture on the route:—'The river, during the day's march, passed through forests of elm, oak, pine, birch, &c. being studded with isles not less fertile and lovely than its banks; and many a spot reminded us of the rich and quiet scenery of England. The paths of the numerous portages were spangled with violets, roses, and many other wild flowers; while the currant, the gooseberry, the raspberry, the plum, the cherry, and even the vine, were abundant. All this bounty of nature was imbued, as it were, with life by the cheerful notes of a variety of birds, and by the restless flutter of butterflies of the brightest hues. Compared with the adamantine deserts of Lake Superior, the Kaministiquia presented a perfect paradise.' Here is another, for the sake of contrast:—'On the morrow, towards noon, we made a short portage from the Macan to a muddy stream falling into Lac la Pluie. As we were passing down this narrow and shallow creek, fire suddenly burst forth in the woods near us. The flames, crackling and clambering up each tree, quickly rose above the forest; within a few minutes more, the dry grass on the very margin of

* Narrative of a Journey Round the World during the Years 1841 and 1842. By Sir George Simpson, Governor-in-Chief of the Hudson's Bay Company's Territories in North America. London: Colburn. 1847.

the waters was in a running blaze; and before we were well clear of the danger, we were almost enveloped in clouds of smoke and ashes. These conflagrations, often caused by a wanderer's fire, or even by his pipe, desolate large tracts of country, leaving nothing but black and bare trunks, and even these sometimes mutilated into stumps—one of the most dismal scenes on which the eye and the heart can look. When once the consuming element gets into the thick turf of the primeval wilderness, it sets everything at defiance; and it has been known to smoulder for a whole winter under the deep snow.'

After traversing Lac la Pluie, Sir George was presented with a letter, congratulating him on his arrival, and soliciting an audience. The letter was written in English, and in good set terms, by one of about a hundred Salteaux warriors; but as soon as a favourable answer was received, his red 'children' set themselves to work to 'pelt away at him with their incantations.' Gathering round a fire, they endeavoured to bend his mind to their wishes by charms, rattles, and burnt offerings, and closed the performance by marching round the circle, singing, whooping, and drumming. The object of these literary savages was to obtain a renewal of the abolished gift of rum!

On reaching Red River settlement, they had accomplished a voyage of two thousand miles. This was founded by Lord Selkirk in 1811, in pursuance of his plans of British emigration; but after his death, in 1820, it received no encouragement from government. The census, notwithstanding, numbers at present five thousand souls; and the population, consisting of Scotch Highlanders, Orkney-men, and half-breeds from the Swampy Cree Indians, doubles itself every twenty years. 'Fort Garry, the principal establishment in the place, is situated at the forks of the Red River and the Assiniboine, being about fifty miles from Lake Winnipeg, and about seventy-five from the frontier; and it occupies, as nearly as possible, the centre of the settlement. This, which is the official residence of the governor of the colony, is a regularly-built fortification, with walls and bastions of stone. Nearly opposite, on the right bank of the united streams, is the Roman Catholic cathedral. The principal Protestant church is about two miles further down, on the left bank.

'In the immediate neighbourhood of this last-mentioned place of worship stands the Red River Academy—a large and flourishing school, kept by Mr and Mrs Macallum, for the sons and daughters of gentlemen in the service. Below Fort Garry many respectable dwellings, most of them of two storeys, belong to the wealthier class of inhabitants. The lower fort, which is about four times the size of the upper establishment, is in process of being enclosed by loopholed walls and bastions. This is my own head-quarters when I visit the settlement; and here also resides Mr Thom, the recorder of Rupert's Land—so named in the royal charter.'

From this place their journey lay over a series of plains, diversified by a constant succession of small lakes, and occasionally sand-hills, but terminating near the settlement of Carlton in scenes like this:—'In the afternoon we traversed a beautiful country, with lofty hills and long valleys, full of sylvan lakes, while the bright green of the surface, as far as the eye could reach, assumed a foreign tinge under an uninterrupted profusion of roses and blue-bells. On the summit of one of these hills, we commanded one of the few extensive prospects that we had of late enjoyed. One range of heights rose behind another, each becoming fainter as it receded from the eye, till the farthest was blended, in almost undistinguishable confusion, with the clouds, while the softest vales spread a panorama of hanging copes and glittering lakes at our feet.' Here a story is told of certain unsophisticated savages who had never seen Europeans before, and who were greatly puzzled by the appearance among the strangers of a negro. 'This man they inspected in every possible way, twist-

ing him about, and pulling his hair, which was so different from their own flowing locks; and at length they came to the conclusion that Pierre Bungo was the oddest specimen of a white man that they had ever seen.'

Leaving Fort Carlton on the 19th of July, they enjoyed a buffalo hunt, which appears to be a game of mere slaughter; 'and then come into play the science and art of curing what has been killed. Sometimes dried meat is preferred, the bones being taken out, and the flesh hung up in the sun; but if pemmican be the order of the day, the lean, after being dried, is pounded into dust, which, being put into a bag made of the hide, is enriched with nearly an equal weight of melted fat.' On this food the traveller lives very well; although occasionally there are scenes of famine as well as repletion. 'In the year 1820, when wintering at Athabasca Lake, our provisions fell short at the establishment, and on two or three occasions I went for three whole days and nights without having a single morsel to swallow; but then, again, I was one of a party of eleven men and one woman who discussed three ducks and twenty-two geese at a sitting. On the Saskatchewan the daily rations are eight pounds of meat a-head, whereas in other districts, our people have been sent on long journeys with nothing but a pint of meal and some parchment for their sustenance.'

Fort Edmonton is the capital of a district as large as England, yet containing a population of less than seventeen thousand natives. Leaving this place, the ground began to rise more perceptibly, and the scenery to assume a wilder character, while even the willow and poplar disappeared, 'and nothing was to be seen but the black, straight, naked stem of the pine, shooting up to an unbroken height of eighty or a hundred feet; while the sombre light, as it glimmered along numberless vistas of natural columns, recalled to the imagination the gloomy shades of an assemblage of venerable cathedrals.' At length, 'about seven hours of hard work brought us to the height of land, the hinge, as it were, between the eastern and the western waters. We breakfasted on the level isthmus, which did not exceed fourteen paces in width, filling our kettles for this our lonely meal at once from the crystal sources of the Columbia and the Saskatchewan, while these feeders of two opposite oceans, murmuring over their beds of mossy stones, as if to bid each other a long farewell, could hardly fail to attune our minds to the sublimity of the scene.'

The descent of the mountains towards the Pacific is beautifully described, but with little of human interest, if we except the scantiness of the travellers' supplies of food, only indifferently assisted by boiled moss and 'cakes of hips and haws,' and of an almost tasteless bulb called kamma. These delicacies are gathered and prepared by the women, while the men occasionally do worse than lounge. 'In one tent a sight presented itself which was equally novel and unnatural. Surrounded by a crowd of spectators, a party of fellows were playing at cards, obtained in the Snake Country from some American trappers; and a more melancholy exemplification of the influence of civilisation on barbarism could hardly be imagined, than the apparently scientific eagerness with which these naked and hungry savages thumbed and turned the black and greasy pasteboard.' After passing Fort Colville, they embarked on the Columbia, and suffering much from the heat, arrived in due time at the embouchure of the river in the Pacific.

Sir George now proceeded on a long voyage along the coast to Sitka, and here the character of the savages appears to change. 'In the fleet that swarmed around us we observed two peculiarly neat canoes, with fourteen paddles each, which savoured very strongly of honeymoon. Each carried a young couple, who, both in dress and demeanour, were evidently a newly-married pair. The gentlemen, with their "arms around their dearies O," were lavishing their little attentions on the

ladies, to the obvious satisfaction of both parties. The brides were young and pretty, tastefully decked out with beads, bracelets, anklets, and various ornaments in their hair, and, above all, with blankets so sweet, and sound, and clean, that they could not be otherwise than new. The bridegrooms were smart, active, handsome fellows, all as fine as a holiday, and more particularly proud of their turbans of white calico. The following is extremely curious:—'In addition to the mode of dressing the hair, the people of this coast have several other peculiarities, which appear to indicate an Asiatic origin. In taking a woman to wife, the husband buys her from her father for a price as his perpetual property; so that, if she separate from him, whether through his fault or her own, she can never marry another during his life. Again, with respect to funerals: the corpse, after being kept for several days, is consumed by fire, while the widow, if any there be, rests her head on the body till dragged from the flames, rather dead than alive, by her relatives. If the poor creature recovers from the effects of this species of suttee, she collects the ashes of her deceased lord and master, which she carries about her person for three long years; and any levity on her part during this period, or even any deficiency in grief, renders her an outcast for ever.' Here is a true Arabian trait:—'If a stray enemy, who may find himself in the vicinity of one of their camps, can proceed, before he is recognised, to the chief's lodge, he is safe, both in person and in property, on the easy condition of making a small present to his protector. The guest remains as long as he pleases, enjoying the festivity of the whole village; and when he wishes to depart, he carries away his property untouched, together with a present fully equal to what he himself may have given.' The savages along the whole coast live well, having no want of fish, berries, seaweed and venison.

'According to the whole tenor of my journal, this labyrinth of waters is peculiarly adapted for the powers of steam. In the case of a sailing vessel, our delays and dangers would have been tripled and quadrupled—a circumstance which raised my estimate of Vancouver's skill and perseverance at every step of my progress. After the arrival of the emigrants from Red River, their guide, a Cree of the name of Bras Croche, took a short trip in the Beaver. When asked what he thought of her—"Don't ask me," was his reply; "I cannot speak: my friends will say that I tell lies when I let them know what I have seen; Indians are fools, and know nothing; I can see that the iron machinery makes the ship to go, but I cannot see what makes the iron machinery itself to go." A savage stands nearly as much in awe of paper, pen, and ink, as of steam itself; and if he once puts his cross to any writing, he has rarely been known to violate the engagement which such writing is supposed to embody or to sanction. To him the very look of black and white is a powerful "medicine." A dreadful system of slavery prevails on the north-west coast. These thralls are just as much the property of their masters as so many dogs, with this difference against them, that a man of cruelty and ferocity enjoys a more exquisite pleasure in taunting, or starving, or torturing, or killing a fellow-creature, than in treating any one of the lower animals in a similar way. Even in the most inclement weather, a mat or a piece of deer-skin is the slave's only clothing, whether by day or by night, whether under cover or in the open air. To eat without permission, in the very midst of an abundance which his toil has procured, is as much as his miserable life is worth; and the only permission which is ever vouchsafed to him, is to pick up the offal thrown out by his unfeeling and imperious lord. Whether in open war, or in secret assassination, this cold and hungry wretch invariably occupies the post of danger.' These slaves are often subjected to the most frightful cruelties.

From Sitka Sir George retraced his path to Vancouver, and thence proceeded to Monterey in California. The horrors still perpetrated in this country by the

Spaniards, are a disgrace not only to Europe, but to human nature. 'When the incursions of the savages have appeared to render a crusade necessary, the alcalde of the neighbourhood summons from twelve to twenty colonists to serve, either in person or by substitute, on horseback; and one of the foreign residents, when nominated, about three years before, preferred the alternative of joining the party himself, in order to see something of the interior. After a ride of three days, they reached a village, whose inhabitants, for all that the crusaders knew to the contrary, might have been as innocent in the matter as themselves. But, even without any consciousness of guilt, the tramp of the horses was a symptom not to be misunderstood by the savages; and accordingly, all that could run, comprising of course all that could possibly be criminal, fled for their lives. Of those who remained, nine persons, all females, were tied to trees, christened, and shot. With great difficulty and considerable danger, my informant saved one old woman, by conducting her to a short distance from the accursed scene; and even there he had to shield the creature's miserable life by drawing a pistol against one of her merciless pursuers. She ultimately escaped, though not without seeing a near relative, a handsome youth, who had been captured, slaughtered in cold blood before her eyes, with the outward and visible sign of regeneration still glistening on his brow.' Yet the Spaniards of the Pacific are very different beings among themselves. 'Of the women, with their witchery of manner, it is not easy, or rather it is not possible, for a stranger to speak with impartiality, inasmuch as our self-love is naturally enlisted in favour of those who, in every look, tone, and gesture, have apparently no other end in view than the pleasure of pleasing us. With regard, however, to their physical charms, as distinguished from the adventitious accomplishments of education, it is difficult even for a willing pen to exaggerate. Independently of feeling or motion, their sparkling eyes and glossy hair are in themselves sufficient to negative the idea of tameness or insipidity; while their sylph-like forms evolve fresh graces at every step, and their eloquent features eclipse their own inherent comeliness by the higher beauty of expression. Though doubtless fully conscious of their attractions, yet the women of California, to their credit be it spoken, do not "before their mirrors count the time," being, on the contrary, by far the more industrious half of the population. In California, such a thing as a white servant is absolutely unknown, inasmuch as neither man nor woman will barter freedom in a country where provisions are actually a drug, and clothes almost a superfluity; and accordingly, in the absence of intelligent assistance, the first ladies of the province, more particularly when treated, as they too seldom are by native husbands, with kindness and consideration, discharge all the lighter duties of their households with cheerfulness and pride. Nor does their plain and simple dress savour much of the labour of the toilet. They wear a gown sufficiently short to display their neatly-turned foot and ankle, in their white stockings and black shoes, while, perversely enough, they bandage their heads in a handkerchief, so as to conceal all their hair except a single loop on either cheek; round their shoulders, moreover, they twist or swathe a shawl, throwing over all, when they walk or go to mass, the "beautiful and mysterious mantilla."

'The men are generally tall and handsome, while their dress is far more showy and elaborate than that of the women. . . . Implicit obedience and profound respect are shown by children, even after they are grown up, towards their parents. A son, though himself the head of a family, never presumes to sit, or smoke, or remain covered in presence of his father; nor does the daughter, whether married or unmarried, enter into too great familiarity with the mother. With this exception, the Californians know little or nothing of the restraints of etiquette: generally speaking, all classes associate together on a footing of equality; and on particular occa-

sions, such as the festival of the saint after whom one is named, or the day of one's marriage, those who can afford the expense give a grand ball, generally in the open air, to the whole of the neighbouring community.' The Californians, in fine, are happy, hospitable, indolent, and ignorant; and their dominion, in the opinion of Sir George Simpson, is destined very soon to fall out of their nerveless hands into those of either the English or Americans.

But we must here break off, hoping to follow our traveller next week in his voyage across the Pacific.

BILLS OF MORTALITY.

THE Registrar-General's Report for the first quarter of the present year has just been placed before us. The statements it contains are of so important a nature, that we believe them to be deserving of wider publicity in a summary form. The quarterly returns do not comprise the whole country, but are taken from 117 districts, 36 of which are in London and its suburbs, the other 81 include a few agricultural districts, and the principal towns and cities of England—of which, taken altogether, the population in 1841 was nearly 7,000,000.

It has usually been observed that more deaths occur in the winter than in the summer quarter; but from June to September of last year, the deaths exceeded those of any other quarter in the preceding seven years; but in the quarter ending March 1847, the number of deaths is stated to have been 56,105, being 6035 above the average of any corresponding quarter. Various causes have been assigned for this excessive mortality: among others, the long duration of a low temperature, and the high price of provisions. In all the returns, there is a large amount of deaths from inflammation of the lungs and air-tubes, and typhus fever, the certain attendant on misery and destitution in crowded neighbourhoods. The fatal effects of the immigration of the starving Irish into the Lancashire towns is shown in the increased mortality—the deaths in Liverpool were 1134 more than in the winter quarter of 1846. This, according to the Registrar's statement, is 'solely attributable to the many thousands of Irish paupers who have landed here within the last three months, bringing with them a malignant fever, which is here very properly called "the Irish fever;" and many hundreds of them were suffering from diarrhoea and dysentery when they arrived, which will account for so many deaths from those causes. Everything which humanity could devise, and money carry out for their cases, has been adopted by the Select Vestry; but so many thousands of Irish are continually pouring in, and their habits are so disgustingly filthy, that little can be done as yet to stay the great mortality amongst them. Perhaps there is not a parallel case to Liverpool for the last two months in the history of the country.'

This statement reminds us of the documents written by eye-witnesses of the plague in its sweeping visitations two centuries ago. The number of deaths in the metropolitan districts is 15,289, also a greater number than in any previous corresponding quarter. The report states, that 'although the causes are to a certain extent accidental, and, as we may hope, transitory, it is evident that the health of towns in England is at present stationary, not to say retrograding.' As regards climate, London is shown to be no worse off than the surrounding parishes, and the excess of deaths is traced to atmospheric impurity. A comparison drawn between the metropolitan districts and an outlying district comprising Blackheath, Eltham, Sydenham, and Lewisham, shows the deaths in London to have been more numerous by 97,872, in the seven years ending 1844, than they would have been had the mortality not exceeded the ratio of the country districts. 'A considerable part,' we are informed, 'of the population of London is recruited from the country, immigrants entering chiefly at the ages of 15 to 35, in a state of good health. The

sick and weakly probably remain at home; many of the new-comers too, unmarried, when attacked in London by slow consumption—the most fatal disease at the ages of 15 to 35—return to their father's house to die; so that the mortality of the great city is made to appear in the returns lower at those ages than it is. If we take children under 5 years of age, where neither these disturbing causes nor occupation interfere, the deleterious influence on health, of London in its present state, will appear undisguised in all its magnitude.' In this case it appears that, in the seven years 1838-44, the deaths of children under 5 years of age in London amounted to 139,593, while in the ratio of the outlying district above referred to, it would have been 80,632. In a fact so startling as a loss in excess of nearly 59,000 infant lives in seven years, we have an unmistakable argument in favour of improved sanitary regulations.

The comparison is carried still further, so as to include the whole number of deaths; and we learn that, 'instead of the inhabitants of London "measuring out the whole period of the present existence allotted to them," it is found that in seven years 139,593 perished in infancy (under 5 years of age); 40,828 in youth (5 to 25); 109,126 in manhood (25-65); and that only 52,453 attained the age of 65 and upwards. Instead of death "coming upon them like a sleep," when the faculties are dulled by age and slow decay, it convulses tender infancy, falls with burning fevers upon man in his prime, snatches away the mother with the babe still upon her breast.' Thus, with a population of nearly 2,000,000 in 1844, we find that the total excess of deaths in London, to say nothing of sickness, was nearly 100,000. One hundred and thirty-four persons die every day in London; but were the great city as healthy as the surrounding districts, the number would be diminished by 38. After some remarks on the apathy of local authorities, and an exposure of the fallacy that London 'cannot be surpassed' for health and cleanliness, the Registrar states that, of the 36 metropolitan districts, the city within the walls stands ninth on the sanitary scale, and without the walls, including Whitechapel, stands last, 'the unhealthiest of the 36;' and, supposing the mortality to be represented by a shaded map, would be the darkest-coloured. 'A general idea,' he continues, 'may, however, be formed of the distribution of the poison which causes death. According to the latest researches, it is not a gas, but a sort of atmosphere of organic particles, undergoing incessant transformations; perhaps, like malaria, not odorous, although evolved at the same time as putrid smells; suspended like dust, an aroma, vesicular water in the air, but invisible. If it were for a moment to become visible, and the eye could see it from a central eminence, such as St Paul's, the disease-mist would be found to lie dimly over Eltham, Dulwich, Norwood, Clapham, Battersea, Hampstead, and Hackney; growing thicker round Newington, Lambeth, Marylebone, Pancras, Stepney; dark over Westminster, Rotherhithe, Bermondsey, Southwark; and black over Whitechapel and the city of London without the walls. The district of St Giles's would be a dark spot in the midst of surrounding districts; St George's, Hanover Square, and St James's in Westminster, would be lighter than Marylebone and St Martin-in-the-Fields; part of the city of London within the walls would present a deep contrast to the city without the walls. This disease-mist, arising from the breath of two millions of people, from open sewers and cess-pools, graves and slaughter-houses, is continually kept up, and undergoing changes. In one season it is pervaded by cholera, in another by influenza; at one time it bears small-pox, measles, scarlatina, and hooping-cough among young children; at another it carries fever on its wings. Like an angel of death, it has thus hovered for centuries over London. But it may be driven away by legislation. If this generation has not the power to call the dead up from their graves, it can close thousands of graves now opening. The poisonous vapour may yet clear away from Lon-

don, and from all the other towns of the kingdom: some of the sunshine, pure water, fresh air, and health of the country, may be given to the grateful inhabitants of towns by the parting voice of the legislature.'

DELUSIONS AND ILLUSIONS.

We have now got into what the calendar terms summer, and are able to look back, with thankfulness that it is over, on what the poets call spring. Summer, indeed, deserves some compliment at our hands; for it is far better than the promise with which it sets out. Even in the 'sweet south' of London, 'Love, whose month is ever May,' begins operations with a procession of chimney-sweepers, who, in the midst of showers of sleet, leap round a leaping bush to keep themselves warm, while everybody else is cowering over the fire. The exercise, however, has no doubt some effect, as well as the music and the shouts. The year by and by grows warm, and the heart merry; and as the poor tawdry damsel of the procession, in muslin and spangles, vanishes down some murky court, 'in thick air,' the true goddesses of the season come forth and light up the world with beauty.

But we have not a word to say for spring. Instead of 'the winds of March taking the air with beauty,' they take nothing but tiles and chimney-pots, hats and umbrellas; and 'the voice of the April bird' was never heard by the very oldest inhabitant, except from a cage. Yet hear Miss Landon—

'Twas the first month of spring.
Like a green fan spread the horse-chestnut leaves,
A shower of yellow bloom was on the elm,
The daisies shone like silver, and the boughs
Were covered with their blossoms, and the sky
Was like an augury of hope, so clear,
So beautifully blue.'

What a pity that all this is—gammon! Fans of leaves—yellow bloom—silver daisies—blossom-covered boughs—and cerulean skies, in the cold, shivery, gusty, gloomy, asthmatic month of February, when the ground is one mass of mud where it is not covered with snow! On the 14th of the same month, we are told,

'The breath of the morning is flinging
A magic on blossom and spray;
And Cockneys and sparrows are singing
In chorus on Valentine's Day.'

But the curious thing is, that it is not the Cockneys and sparrows alone that mistake the season, but even the poets whose reputation rests upon their close observation of nature. Hear Thomson, for instance—

—'Forth in the pleasing spring
Thy beauty walks, thy tenderness and love.
Wide flush the fields, the softening air is balm;
Echo the mountains round: the forest smiles;
And every sense, and every heart is joy.'

One would think, too, that the inspired ploughman ought to know something practically of spring; but whatever his knowledge might be, he makes the Queen of Scots assert that on the approach of that season,

'Nature hangs her mantle green
On every blooming tree,
And spreads her sheets o' daisies white
Out o'er the grassy lea;'

that the sun cheers the crystal streams and azure skies; that the laverock wakes the merry morn, the merle makes the woodland echoes ring, and the mavis sings the day to sleep; and that the whole world is bright with the lily, the primrose, and the buds of the hawthorn and sloe. After this, it is no wonder that the fanciful ear of Coleridge should detect

—'The murmuring
Of wild bees in the sunny showers of spring!'

It would be easy to multiply quotations of this kind; but the fact is well known to all readers, that the spring

of the poets is not the spring of the calendar; and, in fact,

'Their cowlips, stocks, and lilies of the vale,
Their honey-blossoms, that you hear the bees at,
Their pansies, daffodils, and primrose pale—
Are things we sneeze at!'

The origin of the hallucination is obvious enough; although it is more difficult to account for its continuing so long—for Thomson and Burns reproducing the errors of Shakspeare and Milton. As for the tribe of poetasters, whose wooing of the muse usually commences with 'Hail, spring!' it is not more wonderful that they should keep together than the flock of sheep they find so indispensable. The ancients, to confess the truth, have not only stolen our best thoughts, but they have palmed upon us their own seasons: that is the whole secret. Anacreon might very well sing his divine ode to the rose, while 'invoking the wreathed spring;' neither was there anything out of the way in his exclaiming—

'When spring begins the dewy scene,
How sweet to walk the velvet green,
And hear the zephyr's languid sighs,
As o'er the scented mead he flies!'

Horace, in like manner, may be justified in the welcoming he gives to spring, and Catullus applauded for his poetical description of the season in the farewell to Bithynia. But these poets sang of the climate of Greece and Italy; and we in England have no more right to their zephyrs, butterflies, and roses, than to represent their grapes as growing in ripe clusters from our quickset hedges. Our first attempts, however, in 'building the lofty rhyme,' were mere school exercises; and, in spite of the evidence of our own senses—in spite of our chattering teeth and blue lips—the imagery we found in the originals we copied has remained to this day an integral part of our poetry.

A great deal has been said and done about the rectification of the calendar: is it not surprising that no man of mould has yet arisen to set the poetical year to rights, and thus earn for himself a niche in the temple of fame next to those of Julius Cæsar and Pope Gregory? The two cases are precisely similar. In the former, it was found that natural and artificial time did not correspond; and as it was easier to alter the calendar than the sun, a law was made that a certain day, reputed to be such and such a day, should no longer be itself, but another. Thus the world hopped on to a new computation of mortal time, without suffering any inconvenience; for although a lady's eyes, we are told, have the property of 'misleading the morn,' the alteration in the almanac had not the slightest effect upon the revolutions of the earth. The poetical year is in like manner at variance with nature, and legislation is imperiously demanded. We would have all poets strictly charged to remember that spring, in these islands, is the season for high winds, snow, sleet, and rain, coughs, colds, and influenzas; and forbidden accordingly to introduce into it birds, bees, and flowers, tender tales and shepherds' reeds. There is to be no song but the milkmaid's; and that is to be sung only in the streets and lanes of London, to the tune of 'Me-oh!' A lady may shiver in this season, but not sigh; for it is manifestly in opposition to the customs of the stable sex to exhibit any external appearances contrary to real sentiments—

'June in her eyes—in her heart January.'

Lovers are not to be set walking in the damp grounds of April, coughing their tender secrets into each other's ears; and indeed the birth of the tender passion should be postponed till near the end of the following month, if not the beginning of June. In fine, Addison's warning to the fair to avoid the insidious softness of May, is henceforward to be considered obsolete; and no lady need think herself obliged to assume an air of coldness in the presence of her admirer, till she has left off her boa.

We are not sufficiently acquainted with the poetry of the more northern regions, to be able to say at what degree of latitude the classical seasons stop; but, strange as it may appear, we have some notion that in Norway the descriptions of the Greek and Latin poets would be more true than in England. In that Baltic country, the year is no sooner disenchanted from the spells of winter, than the whole country is instantaneously converted, as if by some magical charm, into a garden in full bloom. On the opposite side of the same sea, on the other hand, the only season of beauty and delight is about three weeks of summer; but then these are three weeks for which even the other forty-nine are well worth enduring! There is nothing in the ancient poets that *ought* to satisfy a Russian of the province of St Petersburg; and for this reason, that the brief summer of the Neva has all the rich and glowing beauty of Italy, united, in an indescribable manner, with all the freshness and emerald greenness of the classical spring. It is manifest, therefore, that the poetical calendar of Russia ought to be different from that of Anacreon and Horace; but we have a strong notion, absurd as it may seem, that it is identically the same. The Russians have in all probability borrowed their poetry, just like their fashions, from the French; and the latter, down to the days of Béranger, would have thought it profanity to alter a tittle of the seasons they imported from the other side of the Alps. The tsar, besides, holds even the Gregorian reformation of the almanac in abhorrence, and dates by the old style to this day.

We have some hope that the change we suggest may at one time or other be adopted, since a like change appears to be surely, however slowly, operating in other provinces of poetry. In copying the ancients, we adopted, as a matter of course, their mythology. All Europe was Christianised but the poets, who, in spite of bulls, Smithfield, and acts of parliament, continued, and still to a certain extent continue, downright heathens—swearing by Jupiter and his fellows of Olympus, whom the early fathers reckoned demons, and invoking all sorts of goddesses, as if they were so many saints.

Something may be said in defence of this superstition of the fancy. It was highly convenient to have conventional images to express such abstract qualities as beauty, strength, and wisdom. A single word suggested, to all within the circle of the classical faith, a train of attributes which would otherwise have taken much labour to describe; and these words were things—form, colour, substance. They were like a universal coin, which passed current in the world as the representative of a certain value; and which the simultaneous consent of mankind continued to receive as the circulating medium, long after the dynasty had passed away by which it was struck.

There must have been something strangely fascinating to the rude mind of awakening Europe in this introduction to a class of beings, not different from men in feelings and desires, but how different in beauty, majesty, and power! The gods and goddesses were allied to man in the physical part of his nature, and he was allied to them in the spiritual; and thus it was that his converse with the immortals was attended by no shrinking of the heart, no curdling of the blood, such as throws so repulsive a character over the grosser superstitions of the north. His faith in them resembled faith in himself—

'Delightedly lives he 'mong fays, and tallmans,
And spirits; and delightedly believes
Divinities, being himself divine!'

The slow progress of metaphysics, in an age when the whole human mind seems to be absorbed by physical science, may account for the numerous remains of this poetical faith that still exist. The day, however, is not distant when the whole heathen mythology will be left untouched in the poetry in which it is enshrined; and which will then be regarded as a rare and valuable antique, worthy of all honour and admiration, but unfit

for the imitation of modern taste. Indeed a very considerable change has already taken place, as we may see by the vast leap there is between the straightforward honest orthodoxy of Virgil—

'Arms and the man I sing, who forced by fate,
And haughty Juno's unrelenting hate;'

and the timid scepticism of Byron—

'Oh thou in Hellas deemed of heavenly birth,
Muse, formed, or fabled, at the minstrel's will!'

But we must not touch, without discrimination, even the erroneous conventionalisms of poetry. Let us alter the poetical calendar, because it is wrong; and dispense with the heathen mythology as soon as we can, because it is inconsistent with the new regime the human mind is under: but those things must remain that are apparently truths, although false in reality. The poet, like the painter, must copy the external appearances of nature; and it is by no means his province to assume the functions of the philosopher, and correct the errors of vision. For instance, astronomy tells us that the sun is stationary, at least in so far as the system of which he is the centre is concerned, and that the phenomena of day and night are caused by the revolutions of the earth. Poetry, on the other hand, asserts roundly that the sun moves, glides, or rushes, as it may be, along the sky, and dives down into the ocean, or sinks and disappears behind the hills. Astronomy is right, but poetry is not wrong; for all this we see in nature. To describe the close of day as being caused by the horizon rising above the sun, instead of the sun descending beneath the horizon, would be true in science, but false in poetry; and even the philosopher, while admitting the fact, would burn the verses.

This is a specimen of an illusion, and illusions are the soul of poetry; but the other two—the falsification of the almanac, and the invocation of heathen gods—are rank delusions, and should be classed with punning, pocket-picking, and other offences against taste and morals.

BRITISH INTERCOURSE WITH JAPAN.

For some months past, great exertions have been made in order to induce the government to send a commercial mission to Japan. Whether success will attend these efforts or not, it is impossible for us to say; but the advantages likely to arise from a fortunate termination of the negotiations are so obvious, that few would attempt to deny them. Whilst this subject is under discussion, it may not be uninteresting to our readers to give as concise a narrative as possible of the intercourse that has already passed between us and the Japanese.

Towards the end of the sixteenth century, great efforts were made by the Dutch to supplant the Spanish and Portuguese in their position in the Indian Archipelago. Private adventurers fitted out vessels, and every return of a fortunate enterprise from those parts inflamed the ambition of the merchants and mariners of Holland. In June 1598, five vessels were despatched from Rotterdam to the Indian Archipelago. At that time the English and Dutch were so closely allied, both by religion and companionship in danger, that many of our seamen were constantly found on board our neighbour's vessels. In the present expedition were two of our countrymen, whose names have descended to us—William Adams, and Timothy Shutter. The latter had previously circumnavigated the globe under the famous Cavendish.

After a perilous voyage of fifteen months, the expedition entered the Pacific through the Straits of Magellan. Disasters, followed disasters, and out of the whole fleet, one ship alone returned to Holland, and this was effected through the mutiny of the crew, who compelled the captain to desist from the further prosecution of the voyage. The ship in which Adams and Shutter sailed, after numerous calamities and sufferings, arrived off the coast of Japan in April 1600. The crew were enervated

by famine and disease, and the vessel was a mere floating wreck. On their arrival, the new-comers were seized and treated with severity, their cargo was plundered by the natives, and dispersed beyond recovery. The Spanish and Portuguese, apprehensive lest these men should be released, and having become acquainted with the riches of the Japanese empire, returned with their countrymen to enter into a commercial rivalry, exerted all their influence to induce the viceroy to crucify them, asserting that they were pirates. For some time the prisoners were kept in suspense; at last, after numerous interviews between the viceroy and William Adams, they were all released, and fifty thousand rials granted them as compensation for the loss of their goods. The only answer the monarch vouchsafed to their enemies was, 'that if they were pirates before they arrived in those seas, it was nothing to him; all he knew was, that they had behaved well since they had been within his territories.'

From a prisoner, Adams was raised to be a favourite of the emperor, for whom he performed various important services. Having been a master on board one of Queen Elizabeth's ships, he was qualified for the duty required of him. He built several small vessels for the viceroy after the English fashion, and gave him likewise lessons in geometry and mathematics. So high did he subsequently rise in favour with the monarch, that he granted him an estate, which enabled him to live in great splendour at the imperial court. Yet our countryman was not satisfied: he had left a wife and child in his old dwelling in Limehouse, and his heart yearned for them. At last he petitioned the emperor for leave to depart. He was refused. Again he solicited, and the monarch, although declining his request, bade him invite his countrymen and friends. He wrote several letters, which in time had their effect. The Spanish and Portuguese, finding all their arts unavailing, and that, instead of being disgraced, their enemy rose high into favour, began quickly to alter their demeanour; and to the honour of our countryman be it told, that, instead of using his influence against them, he exerted himself in their behalf whenever they desired any favour of the viceroy. This he was enabled to do, as he was at all times allowed free ingress to the most private apartments of the palace.

In 1609, the Dutch first visited Japan as merchants, and were introduced to the viceroy by Adams. They soon followed this up, and commenced that trade which has lasted to the present day. Adams now addressed a letter to John Saris, chief of the English factory at Bantam, to intreat him to take some steps to let his wife and children in England know of his being alive; and he added an offer of his services in case his countrymen should determine to open a trade with Japan. The result was, that in 1611 Saris was despatched by the East India Company in the *Clove*, with presents and letters from King James to the viceroy. After a long voyage, by Bantam and through the Moluccas, he arrived at Japan, and cast anchor at Firando. During his course through the Spice Islands, he found that the Dutch were endeavouring to render that trade a monopoly, and he experienced every opposition it was in their power to make. However, when he arrived at the Japanese port of Firando, the governor of the town treated him in the most hospitable manner.

William Adams soon joined him, and accompanied Saris to the imperial court. The privileges granted to the English were most favourable, and have never been revoked. A factory was established at Firando, and Richard Cocks was made chief, while William Adams received the next appointment. A brisk trade was soon commenced, and carried on with but few interruptions until the factory was abandoned. The Dutch, however, jealous of our growing power in those seas, and fearing lest we should obtain a stronghold in the neighbouring countries, exerted their influence against us, and, in order to get us into bad odour with the Chinese, plundered their junks, and gave out that the robbers were

English. So far did they proceed, that in 1619, their admiral, Adam Westerwood, attacked the factory at Firando, and would have put our countrymen to death, had they not been succoured by the Japanese. The English were very weak, there not being one of them to a hundred of the Dutch.

On the 16th of May 1620 William Adams breathed his last, and from that time our influence began to decrease in the Japanese court. He made Cocks and a Mr Eaton his executors. Mindful to the last of his family in England, he left half of his estate to his wife and child, and the other half to a son and daughter he had in Japan. Cocks at the time wrote as follows:— 'I cannot but be sorrowful for the loss of such a man as Adams was, being our main stay in those parts; he was in such favour with two emperors of Japan as never Christian was, and might freely have entered and had speech with the emperors when many Japan kings stood without and could not be permitted. This emperor hath confirmed his lordship to his son which the other emperor gave to his father.'

The Dutch having, in 1622, discovered, or pretended to have discovered, a conspiracy of the Portuguese to subdue the Japanese empire under their sway, gave notice of this to the viceroy. A change of policy immediately ensued, and the Portuguese and Spaniards were expelled, and all the other foreigners subjected to more stringent rules. Disgusted with this, and also from not realising the profits they expected, the English East India Company determined for the present to abandon their factory at Firando. Orders were sent to their chief to place the English houses and sheds under the protection, or rather in the custody, of the governor of Firando, who was to preserve them till their return. Our countrymen then left the place, and have never since ceased to regret their want of foresight upon the occasion. They abandoned, without consideration, an opening for our trade, which it will require time and trouble again to restore to us.

Fourteen years afterwards (1637), Lord Weddell visited the port of Nangaaski with a British fleet; but all intercourse with the Dutch was steadily refused by the Japanese, who had already constructed and fortified the artificial island of Dexima, to which the Dutch were restricted. The English having touched at the Portuguese settlement of Macao, is supposed to be the reason of this refusal.

The next British arrival in the Japanese ports was that of the East India Company's ship *Return*, under Captain Simon Delbo. This vessel was despatched by the orders of the Company, to endeavour to re-establish their trade. The period chosen was very ill-timed; we were engaged in a fearful struggle with the Dutch, the only Europeans in Japan; and, what perhaps was still worse, Charles II. was married to a Portuguese princess. The very name of that people being detested in Japan, the Dutch did not fail to make use of this circumstance in order to inflame the jealousy of the authorities. On Delbo's arrival in 1673, he was required to give up all his arms and ammunition, which he immediately did. The next day he was visited by the principal persons of the town, who questioned him very closely. Among other things, he was asked how it was that the English had suffered so long a time to pass without attempting the reopening of the trade. Delbo told them of our civil and foreign wars, which, he alleged, had prevented our paying proper attention to our foreign commerce. Our countryman found that the Japanese were much better acquainted with the news from Europe than he was, which convinced him that the Dutch had given the information, as a Netherland vessel had arrived since he first reached their shores.

After waiting a month for an answer, the captain of

* This should be the viceroy, or acting emperor, with whom alone the Europeans came in contact. The titular emperor was by that time, as he is now, little more than a pontiff, and far too holy to engage in secular affairs.

the Return at last received this pithy reply, 'That the emperor's subjects could not be permitted to trade with those of a king who had married the daughter of his greatest enemy.' Delbo, finding it was useless farther to press the matter, asked permission to sell his cargo. This was refused. He then requested that he might be allowed to remain for the trade-winds; which was conceded. The captain was greatly pleased with the conduct of the natives, whom he describes as extremely courteous, and not less anxious that the trade should be reopened than he was. He felt no doubt that the Dutch were the cause of the refusal.

In 1779, the last expedition of Captain Cook coasted along the islands, and gave English names to several capes. Twelve years later (in 1791), Captain Colnet visited the Archipelago, but was refused all access to the shore. He, however, received every refreshment gratis. In the following year, great efforts were made to induce the East India Company to attempt the re-opening of the trade; but the committee appointed, influenced by antiquated notions of political economy, reported unfavourably of the scheme.

In 1796, Captain Broughton, in his majesty's schooner Providence, sailed among the islands on a voyage of discovery. Wherever he touched, he was received with great politeness by the natives; particularly as, being in a royal vessel, he made no efforts to trade.

In 1803, the Calcutta merchants, influenced, it is said, by the representations of Mr Pitsaigh, a Dutchman who had resided in Japan, sent the ship *Frederic* to Nangasacki, under the command of Captain Toney, with a valuable cargo. The attempt, however, was futile, and the captain was ordered to leave the roads twenty-four hours after being refused permission to trade. In 1808, the English being at war with the French, who at that time were possessed of Holland, sought every means of injuring their opponents. The frigate *Phœton* entered the port of Nangasacki in search of Dutch ships, with orders to 'sink, burn, and destroy' every possession of the enemy. The Dutch state that the English behaved ill, and caused the death of the governor. A few years after, a great outcry was raised against our countrymen, some of whom published a defence. From the conflicting statements, it would appear that the English entered the harbour, and the Dutch resident came on board, who, knowing the prejudices of the Japanese, gave his word that he would not mention that the *Phœton* was a war-vessel. It appears, however, that he broke it; and no sooner was he set on shore, than he spread the news. The Japanese governor, in his fright, and fearful lest the barbarians might commit some mischief, for which he would be held responsible, ripped himself up, according to Japanese custom, and thus put an end to his fears and responsibilities at once. The English, however, merely demanded wood and water, which was readily supplied, together with some beef. The only difference which appears to have occurred between the natives and us was this; that we pressed them to take payment for the provisions sent on board, which they as steadily refused.

In 1813, Sir Stamford Raffles, governor of Java, then a possession of Great Britain, despatched two vessels to Nangasacki. From some cause or other, the cargoes chosen were of inferior quality, and the scarcity of shipping was so great, that he was compelled to pay above 82,000 dollars for the freight of 298,000 dollars' worth of goods; the profits of the whole voyage were 44,000 dollars. The comparative smallness of the amount may be accounted for by the reasons before mentioned. Sir Stamford Raffles tried again on the following year to open up a commerce with Japan, but was unsuccessful.

Captain Gordon, the commander of a fifty-six ton brig, being on a voyage to the west coast of Siberia, resolved to endeavour to commence a traffic with that secluded region, which had so often baffled his countrymen. Accordingly, in June 1818, he sailed into the Bay of Yedo, along with several junks, and was close to the land, as

night came on, without being recognised as a stranger. He expected now that he should be able to sail up to the palace without being discovered. Unfortunately, however, it fell calm, and he was compelled to cast anchor. In the morning, he was visited by numerous boats, at first containing only those whom curiosity prompted to come on board. Presently, however, several officials arrived, to whom the captain communicated his wish that he might obtain permission to return with a cargo suitable to the Japanese market. He was advised to remove his vessel, which was effected by their assistance. He was then requested to send on shore his arms, ammunition, and rudder, and to dismantle his vessel. With the latter demand he refused compliance, on account of the loss of time it would occasion. The brig was then surrounded by a strong cordon of boats and other vessels. During the first day, the vessel was crowded with visitors, who, however, were afterwards prevented by the guard from coming aboard. However, the shores were crowded with spectators, most of whom were females.

Four days after their arrival, they were visited by two interpreters, who were well acquainted with the Dutch language, and knew something of the English and Russian. With these intelligent men Gordon was in constant conversation. Their inquiries about the political state of Europe were numerous, and what appeared to interest them most, was the battle of Waterloo, which was then fresh in the minds of all men. Our countryman discovered that they were acquainted with the vaccination, having obtained this knowledge from Captain Golowuin. They, however, refused any trial of the vaccine matter, without the advice of their superiors. European seeds and cattle were offered them as gifts, but everything was steadily declined, as they alleged that unless permission was given to trade, they would not be allowed to receive any foreign goods. Two or three days after, fresh water was sent on board to fill the casks, which Captain Gordon construed very justly into a sign of his approaching departure. The Japanese employed in this task were very talkative, and chatted about London, which they conceived to be the seat of the arts, and the centre of refinement.

In the course of the same day the interpreters came on board, and in an official manner said, 'You have applied for permission to trade to Japan; we are desired by the governor of this place to inform you that this permission cannot be granted, as the laws of Japan interdict all foreign intercourse, with the exception of that which exists already at Nangasacki with the Dutch and Chinese; and the governor consequently desires you to sail with the first fair wind.' The captain was also told, in a demi-official manner, that the refusal was for fear of giving umbrage to the Russians, who might resent their granting to him what they had so often refused to them. Gordon pressed on them to accept some remembrance, but they were unable to receive it.

In a few hours afterwards, their guns, ammunition, &c. were returned on board, and the captain made preparations for his departure. On the following morning, having given a signal, about thirty boats commenced towing the brig out. As soon as they were clear of the bay, the captain dismissed them, and the English crew gave three cheers to the interpreters as they left the vessel. No sooner had they departed, than hundreds of boats put off from the shore, and crowded the vessel so much, that the captain was glad to see a guard-boat pull towards them to disperse the crowd, who, on observing its approach, fled in all directions. Presently some of them returned, a few of whom expressed their contempt of the boat when they saw it again in sight, whilst others fled immediately, declaring that their lives were in danger. In the course of that and the following day, above two thousand persons visited the ship. We would quote the captain's words with regard to the feelings of the Japanese. He says, 'If inclined to set any value on ideas which can be formed concerning the hearts of men, especially of men accustomed to disguise

their feelings, as we are informed the Japanese are, I would confidently say that our dismissal was regretted by all. This opinion does not arise so much from anything that has been said, as from the remembrance of the eager satisfaction with which everybody used to examine the several articles of my dress, particularly such as were of a fine quality, and the desire, very generally expressed, of purchasing similar articles on our return.

The only account of any further visit of the English of which we know anything, is that of the brig *Cyprus*, and this rests on the doubtful authority of the convicts, who mutinied and seized the ship, and, after various adventures, arrived off the coast of Japan about the beginning of the year 1830. Having, it is supposed, committed some depredations on the coast, they were fired on by the Japanese. The *Cyprus* then steered for the coast of China, but sank on her voyage, in consequence of the injuries she had received. Four of the crew having previously left her, the remaining five reached Canton in the long-boat, where, we suppose, little information to be relied on could be obtained from them. They were then sent to England, and tried and convicted. It is said that they gave some extraordinary accounts before the select committee at Canton; but what these were, we have not been able to ascertain.

It will from this brief sketch be seen that we have never attempted the reopening of the trade in a manner suitable to the greatness of our nation. Every ship that has visited that empire for many years past has been so small and insignificant, as no doubt to confirm the Japanese in the opinion, industriously spread by the Dutch, that we are a dependency of Holland. Should the government determine on sending the mission, we trust it will be on a scale suitable to the grandeur of our empire.

A SECOND GLANCE AT HUGH MILLER'S FIRST IMPRESSIONS OF ENGLAND AND ITS PEOPLE.

OUR former paper on this volume overlooked its many rich geological descriptions, because we had found another department of its contents sufficient to occupy all the space we can spare at once. We now gladly recur to the book, for the purpose of completing our survey of it.

Mr Miller's history as a man of science is remarkable. Passing his youth as a stone-mason, he hewed out a knowledge of the rocks for himself; that is, of the formation which existed around his native place—Cromarty. But this formation he not merely studied. By his researches in it, and his work upon it (*The Old Red Sandstone*), he has been one of those who have obtained for it, what it had not a few years ago, a place in the range of formations, as a group of strata presenting peculiar fossils. To the attainments which this fact seems to indicate, Mr Miller adds powers of thought and of description which eminently qualify him for shining in the popular literature of the science. This will strikingly appear from his account of the neighbourhood of Wolverhampton.

'The town has been built in the neighbourhood of the Dudley coal-basin, on an incoherent lower deposit of new red sandstone, unfitted for the purposes of the stone-mason, but peculiarly well suited, in some of its superficial argillaceous beds, for those of the brick-maker. Hence the prevailing colour and character of the place; and such, in kind, are the circumstances that impart to the great majority of English towns so very different an aspect from that borne by our Scottish ones. They are the towns of a brick-and-tile manufacturing country, rich in coal and clay, but singularly poor in sandstone quarries.

'I took the Dudley road, and left the scattered suburbs of the town but a few hundred yards behind me, when the altered appearance of the country gave

evidence that I had quitted the new red sandstone, and had entered on the coal-measures. On the right, scarce a gunshot from the wayside, there stretched away a rich, though comparatively thinly-inhabited country—green, undulating, lined thickly, lengthwise and athwart, with luxuriant hedgerows, sparsely sprinkled with farm-houses, and over-canopied this morning by a clear blue sky; while on the left, far as the eye could penetrate through a mud-coloured atmosphere of smoke and calm, there spread out a barren uneven wilderness of slag and shale, the debris of limekilns and smelting-works, and of coal and ironstone pits; and amid the dun haze there stood up what seemed a continuous city of fire-belching furnaces and smoke-vomiting chimneys, blent with numerous groups of little dingy buildings, the dwellings of iron-smelters and miners. Wherever the new red sandstone extends, the country wears a sleek unbroken skin of green; wherever the coal-measures spread away, lake-like, from the lower edges of this formation, all is verdureless, broken, and gray. The colouring of the two formations could be scarcely better defined in a geological map than here on the face of the landscape. There is no such utter ruin of the surface in our mining districts in Scotland. The rubbish of the subterranean workings is scarcely at all suffered to encroach, save in widely-scattered hillocks, on the arable superficies; and these hillocks the indefatigable agriculturist is ever levelling and carrying away, to make way for the plough; whereas, so entirely has the farmer been beaten from off the field here, and so thickly do the heaps cumber the surface, that one might almost imagine the land had been seized in the remote past by some mortal sickness, and, after vomiting out its bowels, had lain stone-dead ever since. The labouring inhabitants of this desert—a rude, improvident, Cyclopean race, indifferent to all save the mineral treasures of the soil—are rather graphically designated in the neighbouring districts, where I found them exceedingly cheaply rated, as "the lie-wasters." Some six or eight centuries ago, the Dudley coal-field existed as a wild forest, in which a few semi-barbarous iron-smelters and charcoal-burners carried on their solitary labours; and which was remarkable chiefly for a seam of coal thirty feet in thickness, which, like some of the coal-seams of the United States, cropped out at the surface, and was wrought among the trees in the open air. A small colony of workers in iron of various kinds settled in the neighbourhood, and their congregated forges and cottage-dwellings formed a little noisy hamlet amid the woodlands. The miner explored, to greater and still greater depths, the mineral treasures of the coal-field; the ever-resounding, ever-smoking village added house to house, and forge to forge, as the fuel and the ironstone heaps accumulated; till at length the three thick bands of dark ore, and the ten-yard coal-seam of the basin, though restricted to a space greatly less in area than some of our Scottish lakes, produced, out of the few congregated huts, the busy town of Birmingham, with its 220,000 inhabitants. And as the rise of the place has been connected with the development of the mineral treasures of its small but exceedingly rich coal-field, their exhaustion, unless there open up to it new fields of industry, must induce its decline. There is a day coming, though a still distant one, when the miner shall have done with this wilderness of debris and chimneys, just as the charcoal-burner had done with it when the woodlands were exhausted, ages ago, or as the farmer had done with it at a considerably later period; and when it shall exist as an uninhabited desert, full of gloomy pitfalls, half-hidden by a stunted vegetation, and studded with unseemly ruins of brick. And the neighbouring city, like a beggared spendthrift, that, after having run through his patrimony, continues to reside in the house of his ancestors, shall have, in all probability, to shut up many an apartment, and leave many a forsaken range of offices and outhouses to sink into decay.'

Thus does the man of genius proceed—associating

hard material facts with human interests—while the common mind can give but what directly strikes the eye.

Mr Miller, as we formerly remarked, is a man of decidedly religious character. His earnestness as such, in connection with his literary gifts, has placed him in command of the *Witness* newspaper, the champion of the Free Church of Scotland. It is therefore of some importance for science that its part should be taken by such a man. One chapter of his book is devoted to an able and eloquent defence of geology against those who have unwisely attacked it on so-called theological grounds. Another religious newspaper has, it seems, committed itself to the opinion that, 'for aught that appears in the bowels of the earth, the world might have been called into existence yesterday.' Hereupon Mr Miller writes as follows:—

'We stand in the middle of an ancient burying-ground in a northern district. The monuments of the dead, lichened and gray, rise thick around us: and there are fragments of mouldering bones lying scattered amid the loose dust that rests under them, in dark recesses impervious to the rain and the sunshine. We dig into the soil below; here is a human skull, and there numerous other well-known bones of the human skeleton—vertebrae, ribs, arm and leg bones, and those of the jaws, breast, and pelvis. Still, as we dig, the bony mass accumulates: we disinter portions, not of one, but of many skeletons—some comparatively fresh, some in a state of great decay; and with the bones there mingle fragments of coffins, with the wasted tinsel-mounting in some instances still attached, and the rusted nails still sticking in the joints. We continue to dig, and, at a depth to which the sexton almost never penetrates, find a stratum of pure sea-sand, and then a stratum of the sea shells common on the neighbouring coast—in especial, oyster, mussel, and cockle-shells. It may be mentioned, in the passing, that the churchyard to which I refer, though at some little distance from the sea, is situated on one of the raised beaches of the north of Scotland; and hence the shells. We dig a little farther, and reach a thick bed of sandstone, which we penetrate, and beneath which we find a bed of impure lime, richly charged with the remains of fish of strangely antique forms. "The earth, for anything that appears to the contrary, might have been made yesterday?" Do appearances such as these warrant the inference? Do these human skeletons, in all their various stages of decay, appear as if they had been made yesterday? Was that bit of coffin, with the soiled tinsel on the one side, and the corroded nail sticking out of the other, made yesterday? Was yonder skull, instead of having ever formed part of a human head, created yesterday, exactly the repulsive-looking sort of thing we see it? Indisputably not. Such is the nature of the human mind—such the laws that regulate and control human belief—that in the very existence of that churchyard, we do, and must recognise positive proof that the world was not made yesterday.

'But can we stop in our process of inference at the mouldering remains of the churchyard? Can we hold that the skull was not created a mere skull, and yet hold that the oyster, mussel, and cockle-shells beneath are not the remains of molluscous animals, but things originally created in exactly their present state, as empty shells? The supposition is altogether absurd. Such is the constitution of our minds, that we must as certainly hold yonder oyster-shell to have once formed part of a mollusc, as we hold yonder skull to have once formed part of a man. And if we cannot stop at the skeleton, how stop at the shells? Why not pass on to the fish? The evidence of design is quite as irresistible in them as in the human or the molluscous remains above. We can still see the scales which covered them occupying their proper places, with all their nicely-designed bars, hooks, and nails of attachment; the fins which propelled them through the water, with the multitudinous pseudo-joints, formed to impart to the rays the proper

elasticity, lie widely spread on the stone; the sharp-pointed teeth, constructed like those of fish generally, rather for the purpose of holding fast slippery substances than of mastication, still bristle in their jaws; nay, the very plates, spines, and scales of the fish on which they had fed, still lie undigested in their abdomens. We cannot stop short at the shells: if the human skull was not created a mere skull, nor the shell a mere dead shell, then the fossil fish could not have been created a mere fossil. There is no broken link in the chain at which to take our stand; and yet, having once recognised the fishes as such—having recognised them as the remains of animals, and not as stones that exist in their original state—we stand committed to all the organisms of the geological scale.

'But we limit the Divine Power, it may be said. Could not the Omnipotent First Cause have created all the fossils of the earth, vegetable and animal, in their fossil state? Yes, certainly; the act of their creation, regarded simply as an act of power, does not, and cannot transcend His infinite ability. He could have created all the burying-grounds of the earth, with all their broken and wasted contents, brute and human. He could have created all the mummies of Mexico and of Egypt as such, and all the skeletons of the catacombs of Paris. It would manifest, however, but little reverence for His character, to compliment His infinite power at the expense of His infinite wisdom. It would be doing no honour to His name to regard Him as a creator of dead skeletons, mummies, and churchyards. Nay, we could not recognise Him as such, without giving to the winds all those principles of common reason which in His goodness He has imparted to us for our guidance in the ordinary affairs of life.'

This we conceive to be alike ingenious in conception and conclusive in argument.

After all, we are but at the dawn of scientific discovery, with the mists clinging to the ground all around us. A few years will see men looking back on much of the controversy here adverted to, much of the arguments on both sides, as weak and childish. We cordially echo a fine sentence of our author—and conclude with it—'Who among living men may anticipate the thinking of future generations, or indicate in what direction new avenues into the regions of thought shall yet be opened up by the key of unborn genius?'

THE WOLF AT THE DOOR.

It is calculated, both in and out of parliament, that at this moment the supply of food within the country is much smaller than we require to last us till next harvest; and that we have no certainty, nor even probability, of receiving any assistance of importance from abroad. This would be considered a very awful state of things, if it were possible for us to think of the national affairs as if they were our own. But what is all men's business, is nobody's; and like the individual who did not care about what became of the ship in a storm, since he was 'only a passenger,' we continue talking, with imperturbable calmness, of impending starvation. It is true the cry of 'Wolf' is by no means new to our ears; and it is possible enough that, on the present occasion, it may turn out as unsubstantial as ever; but the circumstances under which it is raised are, to say the least of them, alarming; and we do think it the duty of every person of common sense to endeavour to 'realise' the idea in the American sense of the expression, in order to avoid, as far as possible, the risk of a more literal and terrible realisation.

It is too late, at least with reference to the present year, to think of substituting other vegetables for potatoes; and at any rate, we are not sure that the facility of growth, by which some have been recommended, would be found in the long-run any real advantage.

What we must now do as a nation, is just what we should do as individuals under similar circumstances. We must economise the resources we actually possess, and make our stock of food go as far as possible. What is our stock of food? We are told that it is so many quarters of grain, and that the number of quarters is much smaller than we are in the habit of consuming in the given time. But if it can be shown that our habits have hitherto been grossly extravagant, that we have wasted more than we have eaten, then a remedy must of course be in our power, and for all that has come and gone, we shall be able to keep the wolf from the door.

It appears now to be a recognised fact, that for the sake of the mere colour, a considerable part of the population sacrifice a large portion of the substance, and not a little of the wholesomeness, of the bread; and the queen, and many of the high nobility, have set the example of determining to use in their establishments what is called seconds flour. This is very well, so far as it goes; and it is likewise very well to restrict the allowance issued to one pound a-day for each person, which is amply sufficient. But the bulk of the people already eat seconds bread, and less than a pound a-day of that; and the danger is too imminent, to be averted by economy among the few. It would seem, in fact, by a reference to the customs of other countries, that we are all less careful than we might be; and that we habitually neglect many things which would not only be a resource in time of scarcity, but a comfort in time of plenty.

To begin with small matters: our want of economy, and economical comfort, is impressed upon us by our observation of the daily proceedings of the French. In all families in France, from the lower up to the higher, middle ranks inclusive, there prevails the system of the *pot-au-feu*. The *pot-au-feu* is a common brown earthen vessel, or crock, which the servant, if there be one, places close to the fire the moment it is lighted. Into this all-devouring caldron she throws the bones and other fragments of yesterday's meal, with a sufficiency of water: but this is only by way of a commencement, for it would be hard to say what she does not throw into it. There is not a stray crust, or a fragment of food of any kind in the house, however trifling—not a morsel of butter too minute for separate service, or of fat or grease—not a drop of unappropriated milk—not even a cabbage leaf, provided only it be clean (which is the sole condition with all), that does not find its way into the *pot-au-feu*. Then the hedges and fields are ransacked for sorrel, and other wild vegetables; and, in short, this constant feeding of the constantly-simmering but never-boiling caldron goes on the whole day; servant children, master, and mistress, alike looking to it for a portion of their daily sustenance, great or otherwise, according to the means of the family, and the pretension of their style of living. In England, there is no such economy as this practised; and in London more especially, where soups are seldom eaten than in Scotland, the water in which meat is boiled is more frequently wasted than otherwise. In the better houses, when there is soup, the meat is not presented; the two articles being considered incompatible as dishes, and the one only used in the manufacture of the other. Thus the author of 'Bubbles from the Brunnens of Nassau' is horrified at seeing both on the same table in Germany. 'With regard to the order of the dishes,' says he, 'that is unlike anything Mrs Glass ever thought of: after soup, which, all the world over, is

the alpha of the gourmand's alphabet, the barren meat from which the said soup has been extracted is produced; of course it is dry, tasteless, withered-looking stuff, which a Grosvenor Square cat would not touch with its whiskers.'

This kind of English intolerance is the reason why rice, beans, peas, and other substitutes for potatoes have not been successful among us. We do not object to give these articles a trial, but will not take the trouble to make it a fair one. Rice, for instance, is the most insipid food in the world when cooked *au naturel*; but for that very reason it imbibes more easily than any other the qualities of the juices with which it is mixed. Instead of being eaten with any kind of food, it should form a portion of the dish; in culinary language, it should be used to smother the morsel of meat. And the fatter this is, the better; for the rice absorbs the unctuous moisture, and, with the slightest trouble in the world, becomes the dish so well known to the Parisian epicure under the name of *riz-au-gras*. It may be useful to note here, that the best-flavoured rice is the cheapest—the small, broken, discoloured Indian grain. This is used by returned 'nabobs' of our acquaintance in preference to the American; and indeed we believe there are few of these gentlemen whose families are not provided with the article in one or more bags at a time. Beans, with the mere addition of what we should stigmatise as grease, together with the ordinary condiments, pepper and salt, are considered, on the continent, by classes far removed from the lowest, to form a luxurious dinner of themselves. All the vegetables we have named, together with Indian corn, are more nutritive than meat, and much more so than the turnips which formed the supper of Cincinnatus. And yet 'the noblest foundations of honour, justice, and integrity,' says Dr King in his *Art of Cookery*, 'were found to lie hid in turnips; for when Cincinnatus left the plough to take the command of the Roman army, and afterwards retired to his cottage, having brought home victory, the Samnite ambassadors came to him, and tempted him with a large bribe. They found him dressing turnips: on which they withdrew, convinced that it was impossible to prevail upon him who could be contented with such a supper.'

It is not long since details like these would have been considered undignified; but at a time when the greatest sovereign in the world puts her household on allowance, both as to quantity and quality, in so common an article as bread, we shall probably be excused for hinting to the people that they are not solely dependent upon the forethought of their queen; that there are many little ways in which they can themselves assist in keeping the wolf from the door.

We come now, however, to a much more important branch of the subject, although the parties in whose hands the power rests are not the whole nation, but a very great and numerous body. They are the cultivators of the land, from a few yards of ground up to the most extensive farm.

The most obvious economy of the kind we mean, is that which would appear to be obtainable from a change in the mode of using the seed-corn. Although the great cereal of the East—rice—is of much lower pecuniary value than wheat, a vast deal more trouble is bestowed upon it by the cultivator. It is first sowed in moist ground, and then transplanted separately into completely flooded fields. Indeed the broad-cast system is quite unknown in those parts of the world where grain is the most plentifully raised, and where it is still more emphatically than in Europe 'the staff of life.' When wheat is sown by scattering it in handfuls over the fields, as in England, a quantity is lost by the unavoidable irregularity of its distribution; and it is likewise certain that when the grains chance to be crowded, they interfere with the growth of each other, and render the crop less heavy. In order to obviate these disadvantages, some experimentalists sow their corn in drills, while others plant it by means of the dibble; and both affirm that the saving

in seed, and gain in the crop, are very considerable. A machine has been invented with rows of dibbles, each row eight inches, and each dibble six inches apart, and so contrived, as to drop the seed into the holes, from two to three inches deep. This depth involves another saving; for the grain thus escapes both the birds and the wind.

But hand-dibbling is of course the resource of the smaller occupiers; and in this way from eight to ten quarters of wheat per acre have been obtained. It would appear from the experiments that the crop is not in proportion to the quantity of seed, but that, on the contrary, two or three kernels are better than a greater number. The following was addressed some time ago 'to farmers' by a respectable citizen of London:—'At the end of August 1843, I planted in my garden thirty-two grains of wheat, at six inches distance, an inch and a half deep. The seed was of the first-rate quality. This seed produced this year thirty-two plants, having from ten to twenty-eight stems and ears each; the average number of ears was sixteen; the average weight of each plant $1\frac{1}{2}$ ounce. An acre of land would contain, at six inches distance, 174,240 plants; the produce, 304,940 ounces, or nearly 19,600 pounds; 320 bushels, or forty quarters per acre. The expense of dibbling would be more than saved by the diminished quantity of seed required. I do not mean to state that such a result would be obtained upon a large scale; but I think it is worthy of trial, when we know that the average produce is only $2\frac{1}{2}$ quarters per acre, and that it is possible to grow *forty*. It will be allowed that there is ample scope for improvement. Try a breadth in your fields an inch and a half deep; put one grain, and *one only*, in each hole; plant it at six or eight inches distant; be sure to plant good seed; get as much produce as you can, but go for *forty quarters per acre*.'

This, however, it will be observed, is in garden ground, although it shows (supposing it to be correct) a degree of productiveness that was never suspected to exist. The transplanting system has likewise been successfully tried, and, what is very remarkable, on the same spot of land, year after year—the result being not only a much heavier crop than usual, but a saving of seed more than equivalent to the price of the additional labour. But it will not be supposed that it is the mere dibbling or transplanting that prevents the exhaustion of the soil, and enables the farmer, with the aid of the usual manuring, to extract from it so trying a crop every year: it is the frequent hoeing—which these systems demand, and afford room for—the constant exposure of a fresh portion of the soil to the air. The air is itself *manure*, for it contains the principles of health and aliment; and a frequent loosening and exposure of the soil do more for the plant than the unreflecting would imagine.

— 'The vital air

Pervades the swarming seas and heaving carths,
Where teeming nature broods her myriad births,
Fills the fine lungs of all that breathe or bud,
Warms the new heart, and dyes the quaking blood;
With life's first spark inspires the organic frame,
And, as it waxes, renews the subtle flame.'

Broad-cast fields must take their chance of a fair portion of the influence of this universal restorer, for there is no room for hoeing, and very little for weeding. We do not presume, however, to enter here into the scientific questions of farming: our purpose merely is to show in what manner a saving can be effected, in doubtful or disastrous years, of the food of man.

A curious illustration is given, in Hoare's treatise on the vine, of the true vitality of plants, and the faculty they possess of searching for food where the earth is in such a state as to enable them to send forth their fibres. A bone was placed at a little distance from a vine; and the plant, as if aware of the circumstance, by means of a sense analogous to the scent in animals, despatched a leading root in quest of the prize. The root performed

its mission with fidelity. In passing through some strong clay that intervened, it suffered no obstacle to interfere with its errand, and amused itself with no throwing out of fibres; but on reaching its destination, it clasped the bone in its embraces, and gradually covered it with a minute and delicate lace-work of fibres, that no doubt sucked nutriment from every pore, to be duly transmitted to the parent trunk.

A still more wholesale saving than by means of the dibble, is advocated by Mr Mechi, the proprietor of an experimental farm in Essex, who has demonstrated that he is at least in earnest in his own views, by distributing gratuitously to the extent of very many thousands an account of his doings at Tiptree. 'I believe,' says he, 'I am quite correct in stating, that in our heavy lapd districts only fifty acres out of every one hundred are available to produce food for man, or profit to the farmer. Full twenty acres are consumed by the farm horses, twenty-five acres in long-fallows growing nothing, but involving an outlay of nearly L.5 for each acre, and from five to ten acres occupied by banks, ditches, and farm buildings, leaving the tenant the produce of from forty-five to fifty acres to pay all charges on one hundred acres. I think it is high time such a system should be altered; that by perfect drainage, economy of manure, and superior cultivation, twelve acres should keep the horses, and *all the rest* (save the homestead, and an external iron or wood boundary fence) be available for corn or roots. That this is perfectly practicable, is proved in Lincolnshire, parts of Scotland, and other highly-cultivated districts. It is an easy and profitable way of adding forty per cent. to our territory without the cost, cruelty, and trouble of conquest, military protection, or migration, with the still more pleasing reflection of not having to rend asunder those kindly ties of home, affection, and friendship, the want of which is bitterness in the cup of many an honest emigrant.' His remarks on fences are forcible, though not new. 'With regard to fences, there appears a sort of veneration for them entirely unaccountable. I object to them *in toto*, except such as are of wood or iron. The banks on which they stand are privileged receptacles for every description of noxious weed, insect, bird, and vermin. Unhoed, unploughed, unharrowed, they furnish an annual crop of seed-weeds, carried by winds and by birds on the land, that defies all the farmer's attempts to clean it; that renders long-fallowing necessary, and involves a perpetual expense in hoeing, and loss by superseding so much of the regular crops. In fact, in a variety of ways they involve a loss far beyond the annual interest for the repair of wood or iron fences, or charge for their gradual deterioration. I object even to well-regulated thorn fences, on the score of exhaustion by their roots, the expense of clipping, and the impossibility of disturbing the ground on which they stand. But my dislike amounts to positive indignation at seeing the generality of fences occupying one-tenth of the land that should grow our food, and employ our labour and our capital, spoiling another tenth by their supply of weeds and vermin; their interruption of air and light—to say nothing of the facilities they afford for fraud and neglect of duty, and the difficulties they interpose to a ready supervision by the farmer or his bailiff. If shelter is needed at particular seasons, it can readily be afforded by other means.' Thrashing machines he considers of importance, on account of the saving they effect in the grain. 'Thrashing machines are valued principally for their facility of conversion, and the quantity they perform. To me, their more perfect extraction of the grain, and prevention of fraud and neglect, are far more important considerations. A single grain of wheat in fifty, is two pounds in every hundred, or five shillings per acre; and an examination of straw, whenever we have the opportunity, gives us fearful evidence of what is lost by imperfect thrashing and shaking.'

We have now glanced generally at what appear to us to be some of the most important points for considera-

tion at a season like this. As for the naturalisation of exotic plants, and the extended cultivation of neglected ones, these things belong to the future. We are at present like a ship's company, with a voyage of a certain length before us, and an insufficient store of food according to the usual arrangements; and it behoves us to consider what we are to do. Most of us say practically, 'It is unnecessary yet to think of the length of the voyage; we have enough in the meantime for the day or the month, and before that is expended, who knows that we shall not make another port, or meet some friendly ship upon the ocean?' Others, again, speculate upon the precautions that are to be taken to prevent a recurrence of the danger at some future time; while others still are at once for putting the whole crew upon short allowance, and purchasing eventual safety with present hunger.

The last would seem at first sight to be the most rational plan—only that it is impracticable; and for this reason, that the rations are not distributed by a purser, but are open, conditionally, to all. It is, besides, we are inclined to believe, unnecessary. The stores we have may not be so abundant as in former years, but the deficiency is not greater than may be made up by better management. We have shown, on the authority of practical persons, that we do not exact from the great purser, Nature, one-half the rations she is prepared to give to the skilful, energetic, and industrious; and we have likewise shown, that we by no means turn to proper account even the comparative pittance we receive. Under these circumstances, it is our own fault if the wolf is at the door.

HOME LIFE IN GERMANY.

THE Germans are now, perhaps, the most home-loving people in Europe. We do not refer to their love of country, but to that more close and concentrated patriotism which clings to the circle of neighbourhood, the house, the family, the old occupations, amusements, customs—to all things, in short, that are included in the simple but comprehensive and most beautiful English word, *Fire-side*. Here is a book before us,* referring to the present day in Germany, which, to our sophisticated vision, would seem to present only pictures of the olden time. Its novelty and freshness are those of an ancient ballad; and the feelings it awakens gush up from the sealed fountains of our forgotten youth. The Christmas Tree—that literal tree, but how full of metaphorical meanings!—is planted in the German heart; and still therefore it blooms on the table, winter after winter, its branches heavy with the mutual presents that serve as annual tokens of affection among parents and children, brothers and sisters, masters and servants, friends, neighbours, and acquaintances. And pleasant is the talk round that Christmas Tree (the top branches of an evergreen pine), and merry the laugh, and soft the tear, and solemn the hymn of gratitude and praise; and delightful, too, are the tales with which the winter eve is passed away; for they are told by earnest lips, listened to by indulgent ears, and felt by kindly and loving hearts.

A picture of home life—and knitting book! This conjunction of literature and needlework will amuse the untravelled English; but to those who know Germany, where tales enliven, without interrupting industry, and where the ladies not unfrequently take their knitting even to the theatre, the association will be both natural and pleasing. It reminds one of the announcement of one of Leigh Hunt's journals, as being 'sold at the tobaccoist's.' Of the value of the knitting department

of the work, however, we confess our inability to form a correct estimate; and must, therefore, confine ourselves to the literature, which we do not hesitate to say is at least equal in interest to that of the English Christmas books. But the specimen we are about to give will do something more than support this opinion. It will show the effect of the Christmas Tree upon the character of the German women.

A large party had met at the castle of Count Mansfeldt, at D—, amongst whom the Baroness Marbach shone conspicuous, by her fascinating manners, and truly domestic character. The baroness wished to prepare a surprise for her husband on his birthday, and secretly invited the company present to assemble at her residence, for that purpose, in three weeks' time. The novelty and mystery pleased us all very much; and the secret invitation was not communicated to any beyond the party invited—which was, however, a pretty considerable one, amounting to about ninety persons; for each person at D— had a *carte blanche* to invite a party of their own friends to accompany them. Thus the *clat* of the business was spared to the lady of the house; and no notes or answers being received, no suspicions were aroused.

But some serious domestic matters had in the meantime diverted the baroness's thoughts from this impulse of a moment; and it literally so happened, that the festive day arrived, and with it ninety guests to be entertained, with no previous preparation on the part of the improvident hostess!

The Baroness Marbach, with her husband and three children, were seated at their family dinner on the day in question, when a servant announced the first arrival of guests, in full ball costume. Such is our custom. An invitation for a certain day—however the evening is to close—is always attended early in the forenoon; and this party, who lived a considerable distance off, had set out, accordingly, in their own carriage at nine in the morning.

As for ourselves, we had dreamt of little else but the delightful day we had anticipated spending at Rudel (the name of Baron Marbach's estate); and we amused ourselves on the way by projecting new games and plays, and promising ourselves to dance till daylight. We were the next arrival. Then another, and another carriage full of guests was announced; and the astounded baron believed his birthday must have been placarded. He turned to his wife for an explanation, when suddenly the whole truth flashed upon her mind; and turning deadly pale, she exclaimed, "Walter, what is to become of me? Three weeks ago I invited these guests, to celebrate your birthday, intending a surprise for you; but until this moment the circumstance never recurred to me. What am I to do? Most of my guests come from afar, and will require a substantial dinner."

"Never mind, my love," said the kind husband; "we must put the best face on the matter we can;" and laughing heartily, he led her to the reception-room, to meet her unexpected guests.

With all her usual hospitality, and more than her accustomed grace, did the baroness receive us, while the baron made the announcement of his lady's lapse of memory amidst shouts of laughter, and declarations on the part of the young ladies that each would display her culinary acquirements, by producing an impromptu dish for the occasion. Aprons were in requisition from all the maids, and tied over the more costly dresses of the fair cooks. All was soon bustle and activity in the servants' hall; while those who had before been but slightly acquainted, grew all at once into intimacy, under these exciting and novel circumstances. The gentlemen were permitted to act as assistants, so long as their services were required; while the servants were despatched in all quarters for fish, flesh, and fowl, to meet the sudden demand.

The elder ladies, after having partaken of luncheon, strolled into the park or gardens; and the gentlemen visited the stables and the farm until the appointed

* The German Christmas-Eve; or Deutscher Damen Weihnachts K rbohen, a Picture of Home Life in Germany; comprising Personal Recollections, Tales, and Sketches; with Descriptions and Directions for working upwards of One Hundred very beautiful and entirely original Patterns for Knitting. Illustrated by Numerous Engravings. By Madame Apolline Flohr. Edited by Mrs A. Montgomery. London: G. C. Caines.

dinner hour; when at five o'clock, the soup tureens smoked on the table with most commendable punctuality, and the host and hostess seated themselves at the middle of the table with their elder guests—this being the seat of honour—while the upper and lower ends were devoted to the young people, who had thus laboured for their dinner at least one day in their lives.

'Shouts of laughter echoed through the hall as each dish was analysed and criticised, or left unowned by the fair preparers of the feast, according as the judgment passed was favourable or otherwise. Pretended connoisseurs sought to discover the ingredients of many disguised dishes, ingeniously contrived to vary the paucity of the materials. Crabs had been tortured into hundreds of shapes, and baptised by a variety of appellations not hitherto applied to the crustaceous tribe; and the young gentlemen did not fail to put in their claim to a full portion of the praise awarded to the "neat-handed Phillises," whose ready slaves they had proved themselves in the morning.

'The Baroness Marbach's *quid pro quo* was not only productive of a most enchanting day of mirth, and a night of dance and song, but two of the fair cooks were happily settled in their own houses before many months had elapsed, in consequence of the *talents de ménage* they had that day displayed.

'Theresa Körner, on that memorable day, won the heart of a stately stranger by the grace of her movements in her assumed character, as much as by the delicacy and rich flavour of her tribute to the baroness's entertainment; and the young and blooming Esmeida—who had hitherto been considered by the parents of her lover, the young Count Herrman, as not sufficiently *distinguée* for their son—so gained upon their good graces, on this occasion, by the consummate skill she displayed in her dish of ortolans, that they needed no further solicitation to consent to the speedy union of the happy pair.

'Amongst the guests on this happy occasion there was an English lady, who expressed equal astonishment and admiration at the expertness of my countrywomen in all female domestic accomplishments; and related that, having expected to meet Frau von V— (a most delightful woman) at a large party, she was surprised to receive, as an apology from her husband, the intelligence that his lady was attending to their *large washing* at home!

'The Baroness Marbach explained to the stranger that few German ladies, even of high rank, leave their homes on these occasions; which, however, do not occur (in well-regulated houses) more than twice or thrice in the course of the year, when from twenty to thirty women from the neighbouring villages are engaged for the operation.

'A composition of ashes and oil having been prepared some days before, the wearing apparel and house-linen for the family is then placed in an enormous vat, a coarse cloth is thrown over the whole, and the composition is then poured in till it reaches the top. Cold water is afterwards thrown on all, and it is allowed to run through the bottom by means of a tap; then warm water is poured in several times, and allowed to run off in like manner, the water each time being poured in at a higher temperature, until at length it is thrown in boiling, and is then allowed to remain in the vat twenty-four hours. By this process all wear and tear by rubbing are avoided, and the linen is much whiter than if cleansed by friction.

'After the clothes are considered sufficiently soaked, the vats are conveyed in wagons, drawn by horses, to a piece of clear water, where women stand in boats ready to receive the linen, and to rinse it thoroughly; after which it is conveyed to the drying-ground. When brought home, the servants of the house starch and blue the necessary portion; but all the ladies, old and young, are expected to assist in hanging it out, and folding it for the mangle.

'Every lady is taught to iron and do up her own linen:

although she rarely makes this her habit: and lover as well as husband is well aware that a domestic, good wife, will always superintend the *great washing*.'

We pity the reader who cannot relish these pictures!

TO RECOVER THE APPARENTLY DROWNED.

LOSE no time, but do things quietly and orderly. Avoid all roughness, hurry, and crowding; and observe to regulate the heat and strength of all remedies. Let one intelligent person alone direct, while the necessary assistants implicitly obey. Send for medical aid, and in the meantime act as follows:—

1st, Convey the body carefully, with the face upwards, and the head and shoulders a little raised, to the nearest house or tavern. If to a distance, especially in summer, previously remove any wet clothes, rub the body dry, and wrap it in a blanket, or the garments of bystanders. A covering, such as a dry coat, even over wet clothes, will check further chilling from evaporation. A door or stretcher forms the best conveyance, and a folded jacket might be placed under the head.

2d, The body being removed to a warm room, near a fire, strip and rub it dry, and then lay it on a warm blanket or carpet, the loose sides of which are convenient to cover it, with a warm pillow for the shoulders, and two for the head, arranged on a table or mattress.

3d, Let six active persons only be in the room—namely, one on each side of the body, to rub it all over diligently, but not too roughly, especially near the heart, with warm dry cloths, or a flesh-brush; a third to apply warmth; a fourth to attend to the breathing; a fifth to the head, by constantly cleansing the mouth and nostrils, and turning it aside on vomiting; and the sixth to help generally, and give directions.

4th, To restore warmth and circulation.—Move a heated warming-pan, properly covered, several times over the stomach, heart, and spine. Apply warm flannels or a hot pillow across the stomach, and any heavier *hot* articles, such as bags or stockings of sand, salt, bran, or grains, bottles or bladders of water, bricks or oven-shelves covered, &c. to the armpits, sides of the body, between the thighs and legs, feet and hands. A strong hartshorn, or other stimulating embrocation, or turpentine, rubbed over the chest and spine, is highly useful. Fomentations and means for a warm bath should be got ready, but from frequent mismanagement, they had better be left to medical superintendence; as also the burning of cotton wool, or paper soaked in strong spirits or turpentine, on the pit of the stomach, and the use of electricity or galvanism. On an alarm of drowning the neighbours should freely prepare for the event: sand, &c. can be quickly warmed in a frying-pan, and pillows, towels, &c. in an oven.

5th, To assist or restore breathing.—When beginning, or very weak, imitate it by alternately pressing the belly rather upwards, and the ribs downwards, about fifteen times in the minute, and occasionally held some sharp scent to the nostrils, and irritate them with a feather dipped in vinegar, hartshorn, or mustard. If suspended, gently inflate the lungs with common or dust bellows, having the pipe introduced into one nostril, whilst the other and mouth are closed by an assistant, who should afterwards release them, and compress the chest for expiration; at the same time the upper part of the windpipe should be slightly depressed, and rather pushed back against the gullet, to allow a more certain access of the air. (A bent tube for direct communication with the larynx, having one end fitted by India-rubber to the nozzle of a bellows, should be kept by every medical man.) A more ready plan, especially for children, but defective, from the air being less pure, is managed by a person taking a deep inspiration, and instantly blowing through the mouth or nostrils of the body, either at once by applying the mouth, or by a tube, closing whichever is free with one hand, whilst the windpipe is handled as above stated with the other: thus continue, now blowing into, and afterwards compressing the chest, until natural breathing is restored, or the case appears hopeless.

6th, Nothing should be given inwardly, by the mouth, unless the power of swallowing exists, and then only small quantities of warm ginger tea, spiced negus or ale, or weak spirit and water occasionally. A stimulating clyster, consisting of turpentine, mustard, pepper, ginger, with or without spirit, to half a pint of warm water, is advisable, and might early be administered.

7th. Means of recovery should be persisted in for at least two hours; and if any signs of life have appeared, to even double that time. When recovery seems established, rest should be enjoined; but a strict watch kept for some hours, as sinking is apt to happen from subsequent neglect.

Cautions.—Never shake the body, nor hold it up by the feet, or roll it on casks, as it is a mistaken belief that much water is swallowed. Never rub with salt or spirits, nor inject the smoke or infusion of tobacco. Never bleed, or inject drinks, but by medical advice.

In excessive intoxication, or mixed cases with drowning, the means of restoration are much similar—namely, warmth, friction, artificial breathing, loosening or removal of tight or wet clothes, &c.; but encourage vomiting, or use the stomach-pump, and give drinks of warm water, common or ginger tea—but no spirits, wine, or ale.

In all cases of apparent death, however produced, three objects ought to engage attention:—1st, To remove every hurtful cause; 2d, To regulate the temperature and circulation; and 3d, To restore breathing. It is only a popular fallacy to defer attempts at resuscitation until the coroner or other persons in authority view the body.

BORRUMPT, May 1, 1847.

THE VAMPIRE BAT.

Under the head of 'Zoology,' in a late number of the Journal, it is said that it is a much-disputed question whether the vampire bat ever ventures to assail man, and it strikes me that a circumstance which came under my knowledge may be useful in any future notice you may make of that blood-sucker. I was speaking to a merchant in the island of Trinidad about a horse of a friend of mine having been reduced to a state of great weakness by loss of blood from a wound made by a vampire bat, when he gave me the following account of one of these creatures having attacked himself:—He said he had gone to a house which he had upon an estate in the interior of the island, and being detained until late in the day, he had a bed prepared in a large room, which he usually occupied on such occasions. As the night was hot, he allowed the mosquito curtains to remain suspended, instead of dropping them round the bed; and having extinguished his light, he was lying on his back admiring the moon's rays as they streamed through one of the open windows, when suddenly a large vampire bat flew into the apartment. It immediately occurred to him to try the experiment of baring his chest, and remaining perfectly quiescent, to see whether the monster would attack him. At first, it sailed along on noiseless wing from one end of the room to the other, passing outside the foot of the bed: after several turns, it changed its course, and passed between the canopy of the bed and his person; then it gradually shortened its sweep, sailing backwards and forwards within the space of a few yards, until at last it ceased to sweep past him altogether, but hovered immediately over him, moving its wings with rapidity, but without noise (and he described this agitation of the air as exceedingly soothing and grateful). He declared that he could not exactly distinguish the moment when the bat pitched on his naked breast, so softly did it alight, and so incessant was the fanning of its wings even after it had alighted. He was, however, soon sensible of a slight pain resembling the bite of a leech, and which he no sooner felt than he grasped the bat with both hands, and strangled it. At this distance of time (sixteen years), I could not venture to state positively what he said was the length the creature measured between the tips of its extended wings, but I think it was eighteen inches.—*From a correspondent.*

INFANCY OF COAL GAS.

It appears that Dr Clayton, dean of Kildare, was the first who decidedly obtained gas from coal by distillation. In a letter addressed by the dean to the Honourable Robert Boyle, and inserted in the 'Philosophical Transactions' for 1789, he says:—'I got some coal, and distilled it in a retort in an open fire. At first there came over only phlegm, afterwards a black oil, and then, likewise, a spirit arose, which I could not condense, but it forced my lute and broke my glasses: once, when it had forced my lute, coming close thereto, in order to try to repair it, I observed that the spirit which issued out caught fire at the flame of the candle, and continued burning with violence as it issued out in a stream, which I blew out and lighted again alter-

nately several times. I then had a mind to try if I could save any of this spirit, in order to which I took a tubulated receiver, and putting a candle to the pipe of the receiver whilst the spirit arose, I observed that it caught flame, and continued burning at the end of the pipe, though you could not discern what fed the flame. I then blew it out and lighted it again several times; after which I fixed a bladder, squeezed and void of air, to the pipe of the receiver; the oil and phlegm descended into the receiver, but the spirit, still ascending, blew up the bladder. I then filled a good many bladders therewith, and might have filled an inconceivable number more, for the spirit continued to rise for several hours, and filled the bladders almost as fast as a man could have blown them with his mouth; and yet the quantity of coals distilled was considerable. I kept this spirit in the bladders a considerable time, and endeavoured several ways to condense it, but in vain; and when I had a mind to divert strangers or friends, I have frequently taken one of these bladders, and pricked a hole therein with a pin, and compressing gently the bladder near the flame of a candle till it once took fire, it would then continue burning till all the spirit was compressed out of the bladder, which was the more surprising, because no one could discern any difference in the appearance between these bladders and those which are filled with common air.'

HAPPINESS AND RICHES.

It cannot be too early or too deeply instilled into the minds of the young and inexperienced, that the means and happiness of riches are, in a great degree, in every man's power. A blind belief in destiny, or fortune, acts as a powerful stimulus to indolence and indecision, and makes men sit down and fold their hands in apathy. Nothing is more common in the world than for people to excuse their own indolence by referring the prosperity of others to the caprice of fortune. Success, every experienced man knows, is as generally a consequence of industry and good conduct, as disappointment is the consequence of indolence and indecision. The difference in the progress which men make in life, who start with the same prospects and opportunities, is a proof that more depends upon conduct than fortune; and if a man, instead of envying his neighbour's fortune, and deploring his own, should inquire what means he has employed, or those he has neglected, he would secure a result to his wishes. But the great misfortune is, few have courage to undertake, and fewer candour to execute, such a system of self-examination. Thousands thus pass through life angry with fate, when they ought to be angry with themselves—too fond of the enjoyment which riches procure, ever to be happy without them; and too indolent and unsteady, ever to pursue the legitimate means by which they are attainable.—*Newspaper paragraph.*

DR COTTA.

Besides the great powers who dwell in the palaces of Vienna, and to whose dinners and evening parties welcome and unwelcome guests thronged, there were others who were contented with the smallest space, where they might indulge in privacy and free conversation. Dr Cotta and his wife had, one might say, pitched a tent, so small and transient was their dwelling; but this tent was the centre of much that was going on. Cotta had come to Vienna as the representative of the German booksellers, in order to arrange some measure for securing a general copyright for all the German states: but under this humble guise he had many other objects in view, touching German affairs in general: many were the warnings and recommendations which found their way, through him, into the Augsburg Gazette, and into the Hamburg Observer. While he enjoyed the personal intimacy of several sovereigns, and of the greatest statesmen, his prudence and reserve, together with the power given him by the press, caused him to be trusted with the most important matters. This remarkable man, in spite of his wealth and influence, was simple and homely in his habits, always went a-foot, attended to everything himself, allowed nothing to stand in his way, and how small soever was the business on which he was engaged, he invariably looked to what was great and good in the end.—*Sketches of German Life.*

PRICE 1½d.

MORAL ECONOMICS.

It is commonly supposed that temperance and the revenue are on different sides—that the more alcohol the people consume, the richer will be the treasury. This might be true if the revenue depended exclusively upon alcohol; but since the fact is otherwise, it is an obvious fallacy. A people steeped in drunkenness are the worst possible payers of taxes. The more a man indulges in this way, the less he can indulge in any other way. He must limit himself even in what others consider necessities—apportioning, like Falstaff, a halfpennyworth of bread to two gallons of sack. Taxation, direct and indirect, suffers from his prevailing propensity; and both customs and excise lose far more on the general account than they gain in the individual item.

It would seem, in fact, that a flourishing revenue is the best index to the happiness, and therefore to the temperance, of the people. But a revenue cannot be in a flourishing state which is not in due proportion to the means of the contributors; and this, therefore, has always been the grand problem—how to draw exactly as much from the people as they can reasonably afford to pay. Sometimes taxes are increased in order to augment the revenue, and sometimes they are diminished with the very same object; but in general, it will be observed that the impost rises in amount so long as the consumption of the article continues to extend. When this stops, it is a proof that the fiscal experiments have gone too far, and a change in the opposite direction is tried.

Alcohol, however, under its various denominations of wine, spirits, beer, &c. is supposed to be in a different category from other commodities. Government is called upon to abandon, with regard to it, the principles of political economy, and establish in their stead a new system of moral economics. They are blamed for every relaxation of duties, for every extension of licenses to sell; and at the present moment they are told, that to place the West Indian distillers more nearly upon a footing with those of the parent country, is only putting a new temptation in the way of an already intemperate people. If these views were correct—if it were in the power of the government to put down intemperance by means of fiscal regulations—then would our course be clear; but the problem is by no means so easily solved. High duties do not afford the antidote sought by the moralists; nor, even when amounting to a prohibition, do they limit the consumption. We find practically that comforts, conveniences, respectabilities, luxuries, are one by one abandoned as the forbidden gratification rises from our grasp, till the smuggler steps in with an almost unlimited supply. In this case taxation has done double mischief, by conferring a character of

genteel upon the article (for in England everything that is expensive is genteel), and the smuggled potation, claiming consanguinity as it does with its legitimate brother, is not despised on account of its cheapness.

The puzzlement under which government has always laboured as to the best course to adopt for the safety of the revenue, and the encouragement of the home manufacture (for they never entered very deeply into the moral question), is both amusing and instructive. In the latter half of the seventeenth century, the English became so much addicted to French wine and brandy, that our rulers were in great consternation as to the fate of our brewers and distillers. The plan they adopted in 1689, was entirely to prohibit the importation of these foreign drinks; but this had so little effect, that in a few years after they found they were only abandoning to the smuggler the profits that ought to have gone into their own treasury. They had now recourse to high duties; determining that if people would drink French alcohol, they should at least pay a large price for it. But smuggling was by this time an important trade, which flourishes as well upon high duties as upon actual prohibition; and after contending with it for the greater part of a century, they determined to take stringent measures with the enemy. In 1779, it was enacted that a vessel of any burden, however great, importing foreign spirits in casks of less than sixty gallons, should be liable to confiscation; while vessels of not less than 200 tons burden, sinning in the same way, even if found merely hovering about the coast within two leagues of land, were to share the like fate. But even this would not do; and in a few years they were obliged to compete with the smuggler by lowering their duties. In the meantime price appeared to have no effect upon the consumers of alcohol. When one menstium went beyond their reach, they applied to another. When beaten from brandy, they took to rum; and from rum they fell back upon home distillations—which must always to a great extent defy the revenue officer. But the taste for foreign or colonial spirits was not to be balked by a trifle. In the latter half of the century, for instance, when the duties on rum were tolerably steady, the price paid to the planter, in consequence, it is to be presumed, of the greater demand, rose five shillings a gallon; and yet within this period the quantity of rum imported into London increased from 600,000 to 4,000,000 gallons!

Let us extend a little farther, however, the inquiry as to the effect of price upon temperance. Do we find those countries the most intemperate in which the various forms of alcohol consumed by ourselves are produced? By no means. The wine or brandy does comparatively little harm to those who manufacture it, and can drink it cheaply: it is only when burdened

with duties, and expenses of transit, that it becomes a true poison. The French are a sober people, with their common wine (which has more alcohol than the higher qualities) at a few sous a bottle, and their brandy at a few francs a gallon. In the United States there is less drunkenness than in Scotland; although, in the former country, the price of whisky is only from 10d. to 1s. 4d. a gallon. Of Canada the like may be said, where whisky may be bought for 1s. 6d., and rum for 2s. 4d. a gallon. In Norway the distillation of spirits is quite unrestricted, and the cost, therefore, to the consumer is about 1s. 2d. a gallon. In consequence of this, the intelligent traveller, Laing, 'expected to have seen a great deal of drunkenness and disturbance in an assemblage of four or five thousand people of two distinct nations:' but he saw quite the reverse. 'The only individuals,' he observes, 'I have seen thoroughly drunk, or in the state in which well-clad men may be seen staggering through the streets of Edinburgh every day, are the Laplanders.'

We have endeavoured to make some approach to the relative quantities of alcohol consumed in the countries already mentioned, but without the success which would tempt us to submit the calculations to our readers. The fact is, illicit distillation in England is carried on to an extent which makes figures useless. The enormous apparent increase of the consumption of spirits in 1831, after the reduction of the duty, was quite fallacious: it merely showed that a considerable number of private stills had been disheartened, and left off work. Were it otherwise, a more than double allowance of alcohol (for such was the increase!) would have thrown the whole country into a convulsion of drunkenness. In France, it is very little worth people's while to cheat the revenue in this way; and in the United States, Canada, and Norway, there can be no such thing at all.

Let us now just glance at Australia, which we shall find in a very different category from that of the cheap alcohol countries. The duty there ranges—or did so recently—on the different kinds of spirits from 3s. to 10s. 2½d. per gallon; so that the price, adding a round sum for the cost of grain, must be great enough to meet the moralist's wishes. What is the result? That the annual consumption for every man, woman, and child in New South Wales is 3½ imperial gallons; whereas, even in intemperate England, the average is only a trifle more than one gallon! But this would seem to prove too much: it would seem to prove that although the excise-man and the customhouse officers are the great patrons of drunkenness, some other influence must likewise be at work to contaminate the growing empire in the Pacific. This is true: but there is a remarkable connection between the two influences. The great money value of alcohol in England renders it an article of first-rate social importance; and in establishing the colony, therefore, it was considered necessary to provide liberally for the cravings of intemperance. A regular ration of ardent spirits was served out to all free persons in the government service, great and small; and besides this, large quantities were issued periodically, free of duty, to officers of all ranks. It seemed, in fact, to be the grand ambition of government to keep the colony in a state of constant drunkenness; and so successful were they, that 'shortly after the commencement of the present century,' we are told by Dr Lang of New South Wales, 'it had become one grand scene of brutal dissipation and licentiousness, of lawless violence and rapine.' To this Dr Redfern adds in 1820: 'Eighteen years ago, the period when I arrived in the colony, it was lamentable to behold the excess to which drunkenness was carried: it was no uncommon occurrence for men to sit down round a bucket of spirits and drink it with quart pots, until they were unable to stir from the spot; and frequently did the settler involve himself so deeply in debt by drunkenness, that it terminated in his ruin.' Had spirits been as cheap in England as in America,

and the other countries we have mentioned, government would not have considered them so essentially necessary to their colonists!

From the above examples, it would seem that high duties, instead of acting as checks to intemperance, do quite the reverse: it would seem, in short, that increased cost increases drunkenness. This may be partly owing to the enhanced price letting abroad a new element of disorder among the people—smuggling: but we must go still deeper in search of the whole cause of so apparently anomalous an effect. Who are the drinkers in this country? Those who can afford the luxury, or those who cannot? Among the upper classes, the people of hundreds or thousands a-year, there is hardly such a thing known as drunkenness; and it is only when we descend the scale of wealth, so far as to get within the line of penury and want, that the vice presents itself in any noticeable form. It cannot be said, therefore, that lowness of price is any encouragement to intemperance; for in the one case a bottle of spirits may be the tithe of a week's income, while in the other it is hardly discernible at all as an item in the expenditure. The difference between the two classes in this respect arises partly from the difference in their education and general knowledge; but principally, we fear, from the difference in their position as regards social happiness, or even harmless recreation.

In the case of the United States and Canada, the people, generally speaking, have plenty of work and plenty of food: they have, comparatively with the English, but little temptation to resort to intoxication; and spirits are so abundant and so cheap, as to have no factitious value in their eyes. This latter is a consideration of more consequence than is generally suspected. One would suppose the drinker, at least of the lower classes, to value the spirit on account of the alcohol it contains; but he values it likewise on account of the price. We were once, in threading our way along Drury Lane in London, interrupted by a crowd of women assembled, as they usually are in that street, morning, noon, and night, round a gin-palace. 'The gentlefolks,' remarked one old lady to her gossip as we passed, 'suppose that the likes of us drink only gin; but for my part I have not touched anything less than rum these three weeks!' In France, the same feeling prevails in a class a little higher. Brandy, being cheap, is vulgar; and a *petit verre* of rum is taken by way of a dram—a potion which the English palate rejects contemptuously in favour of brandy.

The French are not a better-informed people than the English, and the cause of their comparative sobriety is to be looked for partly in the cheapness of their alcohol, but chiefly in the multiplicity of their social recreations. They have no occasion to resort to drinking. The lower orders are almost uniformly gay and light-hearted; and their womankind (the natural enemies of drunkenness) are always with them in their social amusements. It is the wise policy of government to encourage this tendency to good-humour; and at public *fêtes* the state furnishes music, and other accommodations, that the people may dance gratuitously. In England, when a great lord desires to celebrate some event, he taps a hoghead of beer for his tenants, or turns a pond of water into punch: in France, he hires a few fiddlers, and makes all the world happy with a quadrille.

'If there be a happy class of people in Europe,' says Mr Laing, 'it is the Norwegian bondor. He is the owner of his little estate; he has no feu-duty or feudal service to pay to any superiors; he is king of his own land, and landlord as well as king; his poor-rate and tithes are too inconsiderable to be mentioned; his scot or land-tax is heavy, but everything he uses is in consequence so much cheaper; and he has that which renders every tax light—the management of it by his own representatives, and the satisfaction of publicity and economy in its application. . . . He is well lodged, has abundance of fuel, and that quantity of land in general which does not place him above the necessity of per-

sonal labour, but far above want or privation, if sickness or age should prevent him from working. . . . He has no cares for his family, because he knows what their condition will be after his death: he knows that his wife succeeds to him; and as long as she remains unmarried, the only difference made by his death is, that there is one less in the family.' Why should the bonder (agriculturist) of Norway be intemperate? What inducement has he to stupify himself with a drug which he can buy for fourteenpence a gallon?

It has now been shown, we believe, that the fears of the moralists on the subject of cheap alcohol are, in all probability, chimerical; and indeed, that if there is any necessary connection between the price and the consumption of intoxicating drinks, it is of a very different kind from what is commonly supposed. We have shown, however, or rather we have repeated a well-known fact, that the intemperate of the present age are the poor and the ignorant, the gloomy and antisocial; and on this point it is impossible to dwell too long or too strongly. The remedies are not duties or restrictions of any kind, but the reduction of *all* taxation to the utmost limits the exigencies of the state will allow; the spread of useful and entertaining knowledge, by means of education and the press; and the cultivation of a cheerful and kindly spirit among the people, by the encouragement of social recreation.

YOUNG FRANCE.

A PARISIAN SKETCH.

TANCREDI P. MATHIEU was a member of the Young France party. He was the son of an honest and simple-minded Parisian grocer, who allowed him a handsome income, and left him at perfect liberty to act as he pleased. His real name was Pierre Mathieu. Tancredi had been assumed for poetical and euphonious reasons. His friends, who knew his sensitiveness on this head, never gave him any other appellation. Like all members of the Young France party—that is to say, about ten or twelve years ago—Tancredi wore long curly hair, a narrow-pointed hat, white kid gloves, and a shirt-collar turned down with the most Byronian despair. Any one who looked on that shirt-collar could have told that its owner was a melancholy man—one 'whose young aspirations had been nipped in the bud by the chilling breath of an unfeeling world.'

Tancredi's existence had indeed been imbittered by various disappointments. In the first place, he was neither an unknown foundling, nor an exile, nor a persecuted man: he had enjoyed throughout life the most provoking and commonplace happiness. He did not even possess the comfort of having a tyrannical father. M. Mathieu the elder was a thoroughly easy and good-natured man. Satisfied with having given his son a good moral education, he allowed him to be the judge of his own conduct; and though he would certainly have been much better pleased to see him engaged in some profitable and useful occupation, he raised no opposition to his joining the Young France party, wearing long hair, and a pointed hat. Some persons kindly assured him that Pierre—they scorned to call him Tancredi—was on the high road to ruin. But M. Mathieu composedly replied that his son was only afflicted with a temporary mania then very prevalent amongst young Frenchmen, and that he did not despair of seeing him one day radically cured. This persuasion did not prevent the grocer from reasoning with his son; he even endeavoured to show him that he was acting very foolishly; but as Tancredi immediately assumed the tone and attitude of a martyr, and as his father—who, under the appearance of great simplicity, was nevertheless possessed of much tact and good sense—perceived that he longed to be persecuted for his opinions, he gradually dropped the subject, and left him perfectly free.

Tancredi keenly felt what he termed his father's injustice. He was at war with society—so at least he

said—and he had a right to persecution. His friends all agreed with him that it was a hard case, but advised him, however, to bear with it patiently. Nor was this the unhappy youth's only cause of grief: another source of bitter regret lay in his personal appearance. Somehow or other he had inherited from his father the grocer a round, rosy, good-humoured face, of which he could not possibly get rid. Notwithstanding his constant efforts to infuse into it some slight portion of the poetical melancholy which, according to his own expression, 'was devouring his soul,' it always looked pleased, happy, and contented. To make matters still worse, he was remarkably fair, and inclined to corpulency. Gladly would Tancredi have sacrificed half his worldly hopes to be thin and sallow. Under these painful circumstances, he was not, nevertheless, without some comfort: one of his best friends had informed him that he was wonderfully like Marat. Like all generous spirits, our hero often forgot his own unhappiness in his philanthropic compassion for the ignorance and blindness of mankind at large: he was convinced that the world was not yet half civilised, and that the bourgeois of Paris especially were in a lamentable state of barbarism. As he was himself a bourgeois by birth, he conceived that his 'mission' must plainly lie in civilising his unhappy brethren; and as he happened to entertain for them the most thorough and hearty contempt, he was evidently peculiarly fitted for this delicate task.

The bourgeois are the middle classes of France. They chiefly consist of retired tradespeople, small capitalists, and *employés*, or clerks, in the offices of the government, from whom they generally receive a moderate salary for their services. They are a quiet and inoffensive race, but remarkably timid and cautious, and tenacious of their habits and opinions to an extraordinary degree. Seeing them so far behind their age, Tancredi generously resolved to devote himself to their improvement. Whether they were willing to be improved or not, was no consideration; indeed Tancredi did not care a pin on the subject. If he could not succeed in making the bourgeois better, he had little doubt of getting persecuted by them; so that, whichever way the wind blew, he felt pretty sure of reaping some benefit. These preliminaries being settled, he resolved to begin his attack on a little colony of bourgeois, which had been settling for the last century in one of the most quiet and retired streets of the Marais, not far from the spot where stood his father's house.

This street, which shall be nameless, very much resembled a country town. Though not possessing more than a dozen houses on either side, it was divided into several sets, which knew nothing whatever of one another. The most important set, and that which immediately drew Tancredi's attention, was Madame Jacquemin's, a lady who, with her husband, a retired dyer, inhabited a coquettish little house, ornamented with a grass plot in front, and a garden at the back, and situated in the most conspicuous part of the street. But notwithstanding these advantages, M. Jacquemin was an unhappy man. He had toiled all his life in order to enjoy his old age in peace; and instead of his fancied happiness, he now found nothing in retirement save ennui and weariness of spirit. It was in vain that he spent the day in walking up and down his handsome house, and about his pleasant garden; they could administer no pleasure to his mind. He would gladly have given them both for the dark and dismal shop of the Rue Saint Denis, where he had spent thirty years of his life in providing for his present discomfort. Madame Jacquemin, who bore her misfortunes with a truly heroic spirit, endeavoured to arouse her husband from his unhappy state. She took him to the play, but he invariably fell asleep before the close of the first act; she then wished to introduce him into fashionable society—a plan which failed signally; and finally, as a last resource, made him take in all the daily newspapers, and give parties twice a-week. M. Jacquemin never looked at one of his newspapers himself; but as

he nevertheless, and very judiciously, made it a rule that not one of them should leave his house, and as he very liberally invited his friends to 'come and look at the papers,' his *salon* was every morning converted into a kind of reading-room, over which he presided, and where, for two or three hours at least, he could once more fancy himself in his shop, surrounded by his customers.

His evening parties were not quite so amusing; because, as Madame Jacquemin often observed, 'they could not ask everybody.' Almost all their guests were inhabitants of the street; but there were of course vulgar insignificant houses, whose lodgers could, under no pretence whatever, be received or admitted by the dyer's wife. Good M. Jacquemin, who, in the fulness of his ennui, would gladly have opened his house to the whole world, was much annoyed by his wife's scruples, but nevertheless compelled to submit to them. Amongst the favoured few were M. Bonnet and his wife, a couple who resided on the first floor of No. 7, and who, as Madame Legrand, a waspish little widow, who lived above them, spitefully averred, gave themselves airs in consequence. But as there was a constant feud between her and Madame Bonnet, too much faith should not be placed in the lady's assertions. M. Bonnet was a melancholy-looking man, exceedingly nervous and timid, and employed at the war-office, whence he often came home in the evening blank with dismay, hinting at horrible tidings from Abd-el-Kader, or intimating the likelihood of a war with 'perfidious Albion.' Being considered a profound politician, and suspected of knowing much more of government affairs than he chose to tell, he was much respected everywhere save in his own family, over which Madame Bonnet, who was a very high-spirited woman, boasted that she alone held dominion. Her three daughters, who strongly resembled their mother, were very tall, very bony, and very spirited girls. Madame Legrand, the officer's widow, who tenanted the second floor of the same house, was likewise admitted at the Jacquemin parties. She was thin, withered, had no children, and was immoderately fond of animals. Whole generations of cats and dogs revelled in her *salon* and bedroom; cages of birds were hung up everywhere in her apartment; and golden fishes swam in vases filled with their native element on every window-sill. M. Laurent, a stout old bachelor, not unlike a full-blown rose, dwelt on the third floor. He had a mortal hatred against Madame Legrand and her menagerie, those of the canine race in particular. Of this fact the dogs seemed to have an instinctive knowledge, for whenever he came up or down stairs, they snarled and growled; and if they chanced to be on the landing, never missed the opportunity of flying at his heels. Though M. Laurent disliked animals, he had a passion for flowers and gardening: he had turned his apartment into a perfect conservatory, and the greatest portion of his time was spent in cultivating and watching over a certain patch of land, about as large as a dining-table, and termed his garden. M. Laurent was of course another of M. Jacquemin's *invités*.

But besides the inhabitants of No. 7, there were various other individuals admitted at the retired dyer's parties. Amongst these were several old ladies, who did an immense quantity of worsted work; and a mysterious family named the De Lorrains, and thought to be of noble extraction, who inhabited an old dreamy-looking hotel at the end of the street. They were six in all—were very pale, tall, and thin; they dressed meanly, accepted every invitation, and gave none in return. Some charitable soul indeed noticed that they never refused anything, not even the refreshments which were liberally handed round at the dyer's parties; and as to the cakes, it was actually suspected that they were so vulgar and ungenteel as to have an appetite for them. It was also known—it is wonderful how those things are always known—that in the coldest weather they had no fires. Sometimes, indeed, they indulged themselves in a fagot, to which they set fire

with great ceremony; the youngest De Lorrain being always on such an occasion despatched in a great hurry to summon his father, in order that he might partake of the genial heat ere it was quite extinct. At first the De Lorrains were thought mean—then they were accused of being poor; but many defended them, and asserted that they were only misers. It then began to be reported that they were immensely rich, and their company was for some time eagerly sought. It is true their fortune, if they had one, was of no great use to anybody, not even to themselves; but who has not felt the sense of security, the comfort, which lies in having a rich acquaintance? As years, however, passed away, and they lived quite as meanly, and dressed as shabbily as ever, this impression wore off: they began to be looked upon as impostors, and there was some talk of discarding them altogether. But Madame Jacquemin, who was of a compassionate disposition, resolved to spare them, on account of their poverty and their gentle blood; they accordingly continued to be admitted to the *soirées*, where they acted a subordinate part, being patronised by every one. Such were the individuals who met at M. Jacquemin's parties; if their company did not afford him much amusement, it was not their fault. The retired dyer was very selfish: he plainly showed his visitors that he cared for no one but himself; yet, strangely enough, everybody sympathised with him, everybody seemed ready to administer comfort and advice.

The De Lorrains spoke of giving dinners as a very interesting occupation. Madame Legrand assured M. Jacquemin that taking to animals would cure him of his melancholy, and actually offered to lend him one of her dogs, and an old canary bird that had long ceased to sing, if indeed it had ever sung; but M. Laurent hinted that animals would sour his temper, and asserted that gardening would prove much more soothing, and talked of sending him down some choice flowers. Madame Bonnet recommended adopting some interesting and sweet-tempered child; not an orphan—you never know what kind of parents an orphan had; swindlers and thieves perhaps—but a child whose parents, honest respectable people, were still alive—and which, she sentimentally added, 'would prove the staff and comfort of his old age.' But M. Jacquemin loved private dinners best; he disliked animals; did not care for flowers; and never having had any children of his own, had conceived a mortal hatred for those of other people—Madame Bonnet's included. He felt, besides, all the rich man's dislike to an heir; and constantly refused to see his poor relations, lest they should think of his will. These were the individuals whom Tancredi P. Mathieu had resolved to civilise. When he was introduced to Madame Jacquemin at one of her *soirées*, he was forcibly struck by the lamentable amount of dulness which he witnessed. The old ladies were busy at their worsted work; M. Laurent and Madame Legrand were quarrelling over a game of piquet; the melancholy De Lorrains were engaged with dominoes; M. Jacquemin was displaying his hospitality by compelling his guests to swallow down immense quantities of cakes and lemonade; and M. Bonnet sat apart, wrapped in his own moody thoughts, which he occasionally condescended to communicate to some eager listener. When Tancredi appeared amongst the quiet circle with his long hair, pointed hat, and white kid gloves, he produced an immense sensation. He scarcely opened his lips, and was thought a prodigious wit. He seemed to entertain the most thorough contempt for the whole world, the individuals around him included; and they all agreed in audible whispers that he was a very superior sort of person—quite a genius: great geniuses always despise the world. Although both piquet and dominoes were neglected, the evening passed away with amazing swiftness. Every one had gathered around the stranger, who opened his mouth every ten minutes, and delivered some oracular sentence, received by his hearers with the utmost gravity.

From that day, Tancredi P. Mathieu became the acknowledged lion of the Jacquemin soirées, and of the Marais, which had never known a lion before. He was the object of every one's admiration: the De Lorrains alone looked upon him with a suspicious eye: they had an instinctive consciousness of a foe. It is true Tancredi did not even bestow a thought upon them, but, like many remarkable individuals, he showed an early inclination to tyranny, and betrayed certain destructive propensities, which threatened to break upon the quiet monotony of the bourgeois circle. Being, as he expressed it himself, 'of a spiritual nature,' he animated in strong terms against the material custom of eating in the evening: he recommended intellectual food; and Madame Jacquemin, who looked upon him as an oracle in matters of taste, immediately suppressed the refreshments and sweets she had hitherto caused to be freely handed round to her guests. Having thus victoriously asserted the triumph of mind over matter, Tancredi next banished both piquet and dominoes. Madame Legrand and M. Laurent, who had quarrelled over the former game for the last twenty years, both loudly protested against this new arrangement; but as their quarrels were only pleasant to themselves, every one agreed that piquet deserved its fate. Having thus deprived his disciples of their old amusements, our hero felt it his duty to provide them with others in their stead. A piano accordingly made its appearance in Madame Jacquemin's drawing-room. It is true nobody could play upon it—not even Tancredi; but that was evidently of little consequence, for towards the close of a very dull evening, he rose, and after vainly beseeching one of the accomplished ladies present to accompany him, at last sung, unaccompanied, but still standing near the silent piano, a pathetic Italian song, in which he bewailed his unhappy fate; for, as he afterwards condescendingly informed the company—who had not understood a single word—he was a forsaken and despairing lover. After thus initiating them to the charms of melody, Tancredi resolved to let them to sublimer mysteries, and accordingly fixed an evening, on which he proposed to read to Madame Jacquemin's guests a series of sonnets, which he had composed several years before, 'On the Prospect of being Compelled by my Father to become a Grocer.' This, it must be confessed, was a little poetical fiction, in which Tancredi had considered himself at liberty to indulge. Nothing was ever further from M. Mathieu's thoughts than to compel his son to anything he disliked, though he certainly had attempted to achieve, by persuasion, the profanation above alluded to.

The evening came, the company gathered around him, and Tancredi began his reading: he persevered for upwards of two hours, without manifesting the least symptom of fatigue. When he had finished, he looked up, and found himself alone, comparatively speaking. M. Jacquemin was fast asleep; the old ladies were nodding over their worsted work; Madame Jacquemin had early effected her escape, with several female friends; M. Laurent and M. Bonnet shook their heads, and exchanged ominous glances; the six De Lorrains alone were wide awake, looking at our hero with their fixed stony eyes, whilst their cadaverous and melancholy faces expressed the most absolute determination to sit out both him and his poetry. To increase the dismal appearance of the scene, the fire had gone out, the candles burned dimly, and wanted snuffing, whilst the loud snoring which proceeded from the vast arm-chair in which M. Jacquemin lay wrapped in the embrace of Morpheus, rather marred the melody of the poet's verses. 'I see they are not in a sufficiently advanced state of civilisation to appreciate the beauties of poetry,' thought Tancredi as he looked upon his audience: 'I must form their political principles.'

Unfortunately for the execution of this project, it happened that both M. Bonnet and M. Laurent had of late conceived strange notions of Tancredi's political character. His foreign name did not sound quite ortho-

dox in their ear; then his pointed hat, shirt-collar, and flowing locks, struck them as being something portentous in their way. Philosophers well know what great meanings sometimes lie hidden under trifles. As to his poetical readings, they had a revolutionary air, in direct opposition to the old school of poetry, and also, they strongly suspected, to the established order of things. Who could tell of whom Tancredi Mathieu might be the agent, or what was going on in the bosom of the hitherto peaceful Marais? Nay, for all they knew, his pretended Italian love-song might be some revolutionary Marseillaise hymn, or *ça ira*, speciously clothed under a foreign garb! In short, the employé of the war-office, and the horticultural amateur, both agreed it was high time to keep their eye upon Tancredi, whom they began to consider as a dangerous political character.

It was under these inauspicious circumstances that our hero began his political campaign. He had not yet exactly determined upon the doctrines he meant to inculcate, but he concluded that he would soon find this out; and as he was not a little elated with the success of his previous efforts, he began his attack in the true spirit of knight-errantry, dealing out his blows right and left, without much minding where they fell. To wealthy M. Jacquemin he foretold that the day would come when the fortunes of the rich would be equally divided amongst the poor; with M. Bonnet he expressed a vast sympathy for Abd-el-Kader, and spoke of a European war as of a thing all but realised; to M. Laurent he manifested the profound contempt he entertained for horticulture, and insinuated that it would be done away with entirely under a new order of things; and when the other sneeringly inquired how the world would go on without geraniums or roses, and that he should like to know, Tancredi answered by dwelling on the charms of hemlock and the deadly nightshade, and hinted, with an ominous glance, that for some blighted spirits they possessed greater attractions than all the blossoms of 'Syria's land of roses.' Madame Legrand he had long mortally offended, beyond all hope of reconciliation, by expressing his ardent desire of seeing every dog hung, and every canary bird shot through the heart; in support of which philanthropic wish he had adduced so many plausible arguments, that the good lady felt convinced that if ever the Young France party prevailed, her menagerie was doomed. Tancredi's crowning exploit was to inform, in confidence, one of the old ladies, whose relations had all perished under the Reign of Terror, that he was wonderfully like Marat; upon which she uttered a fearful scream, and fell into fits; which was no sooner perceived by the other old ladies, her friends, than, out of mere sympathy, they followed her example, almost frightening Madame Jacquemin, at whose house the occurrence took place, out of her wits.

It was with this tact and discrimination that Tancredi endeavoured to civilise the bourgeois of the Marais; the nature of the feelings his discourse and doctrines excited must be left to the imagination of the reader. It is true that, had the worthy citizens known anything about either Tancredi P. Mathieu or the Young France party, they would have been conscious that the former was the most harmless of human beings, and that from the latter there was little or nothing to be apprehended. The Young France party, with their kid gloves, and hair carefully curled, may be the fit apostles of a revolution, but there is little fear of their ever making one. Ominous as their denunciations sound in theory, they are perfectly innocuous in practice. But of this the bourgeois knew nothing, and they received every word that Tancredi uttered as the real expression of his mind. The effect of his revolutionary doctrines was soon apparent; quarrels arose on every side. A spirit of discord had gone forth among the hitherto peaceful inhabitants of the Marais.

Madame Bonnet took it into her head to sympathise with Abd-el-Kader, who became the subject of daily dissensions between her and her husband; a new and

deadly feud sprang up between M. Laurent and Madame Legrand, the former of whom averred that his finest flower-beds were ruined by the widow's dogs. Rendered desperate by one of those disastrous events, and recalling to mind Tancredi's denunciations against pets of every description, M. Laurent, having provided himself with tackle and a fishing-rod, exercised his vengeance on one of Madame Laurent's unoffending golden fishes, by actually fishing it up through his bedroom window. The unhappy lady, who, hearing a suspicious noise against the highest window-panes, had rushed to the rescue, only arrived in time to see her finny favourite whisked up in the air, and vanishing into the enemy's precincts. Her first act was to snatch in her remaining treasures, who, quite unconscious of their companion's fate, were still gaily swimming along their narrow domain; the next was to scream for help, and then faint away in good earnest. When she recovered, she found herself surrounded by condoling friends; but nothing could soothe her wounded spirit. She declared that she never should forgive M. Laurent, against whom she vowed eternal hatred and vengeance.

But even greater evils—all springing from the same source—menaced the guests of M. Jacquemin. The worthy dyer, on whom Tancredi's speeches had made a profound impression, began to entertain serious fears for his safety. Lest his reputation of being a wealthy man should bring him into trouble, he determined to reduce his expenditure; and, as a first step, talked of discontinuing to take in the daily papers, and stopping the soirées altogether. This announcement spread a panic throughout the whole street. M. Jacquemin's house had become a place of public entertainment, which his guests had no inclination to find closed upon them. In this dilemma a general council was held; private dissensions were for a while forgotten, and it was unanimously resolved to strike at the root of the evil, and banish Tancredi P. Mathieu. The gaunt De Lorraines, who alone had from the beginning perceived the impending danger, proposed to signalise him to the mayor of the arrondissement as a dangerous individual; M. Bonnet offered to say a few words at the war-office; M. Laurent to give him a delicate hint in the language of flowers; Madame Legrand proposed a night attack on his person; and the old ladies were for handing him over to the public executioner at once. But Madame Jacquemin rejected all these plans as too violent and inhospitable, and resolved to intimate to him, as politely as possible, that if he chose to continue his visits, it must no longer be on his own terms, but on hers. Accordingly, when Tancredi came as usual to one of the evening soirées, his head full of mighty plans of poetical, social, and political reform, he could not, notwithstanding his abstraction, but notice that a great change had taken place. The piano, which had only been hired for a month, had vanished; M. Laurent and Madame Legrand were quarrelling over piquet to their heart's content; the De Lorraines, who were eating cakes and drinking lemonade, eyed him with defiance; dominoes were re-established in their supremacy; and the old ladies were as triumphantly engaged in worsted-work as on the night of his first appearance amongst them.

One glance told Tancredi that the bourgeois of the Marais had rebelled: his authority was no longer acknowledged; he was virtually dethroned. Even the most energetic minds must sometimes yield to the might of fate: thus it was with our hero. Vanquished, but unsubdued in spirit, he nevertheless saw the uselessness of resistance. Casting a glance of withering scorn on his late disciples, he spake not a word, but turned upon his heel, and left the drawing-room of Madame Jacquemin, inwardly passing the fatal flat, 'for ever.' With signal ingratitude, every one uttered an exclamation of triumph on witnessing his exit. The remainder of the evening was spent in perfect enjoyment—harmony seemed quite restored; and it is averred that, notwithstanding the late painful circumstances

that had occurred, the quarrels of M. Laurent and the fair widow were marked by unusual amenity.

The day after his defeat, Tancredi wrote to one of his friends a letter of seven pages, in which he related, with great seeming bitterness of spirit, his vain attempt to civilise a parcel of barbarians, and instil into their uncultivated minds a love of the fine arts, and a sound political creed. He ended by exclaiming against the cruelty of mankind, that would not allow him one moment's repose; and as he had little doubt that the malice of his antagonists would drive them to every extremity, spoke of exiling himself in some remote solitude, where his wounded spirit might perhaps at last find rest!

By return of post he received the following answer—
'DEAR TANCREDI—I am by no means astonished at your failure; you have met with a fate common to all great spirits; you ought not, therefore, to mourn, but to rejoice. Had you, however, consulted me on the subject, I could have foretold exactly what has happened. Whatever you do, never again attempt to civilise bourgeois. They are very worthy people in their way, but singularly obstinate. They like to enjoy themselves according to their own stupid old-fashioned manner. As they are fast disappearing from the surface of this earth, it is only an act of mercy to allow them to live unmolested. Henceforth heed them not, but turn all your efforts and energies on the rising generation. Give up the thought of going into exile: talents like yours should not be wasted away in a desert. Your devoted,
CHARLEMAGNE CHAMPION.'

But Tancredi was bent on being a persecuted man, and once in his life at least an exile. He announced to his father his intention of leaving the country for some time. M. Mathieu the elder heard him with much more composure than, from the painful nature of the communication, might have been expected; he even remarked that travelling would do his son good, and seemed to view the whole affair as one of minor importance. It was in vain that Tancredi endeavoured to impress upon his mind that he was going to leave the country perhaps for ever. M. Mathieu persisted in asserting that he was only going to travel, and very calmly bade him farewell.

In a few days Tancredi left Paris for Geneva. We will not dwell on the agonizing nature of his feelings when, having passed the frontier, he beheld from the diligence window the blue hills of his country—his native hills, as, forgetting his Parisian birth, he called them—vanish from his view. For three months he wandered on the shores of Lake Leman, and indulged in misanthropic reflections on the folly and ingratitude of mankind. At the expiration of that term—during which he had been, to say the truth, the prey to intolerable ennui—he gladly hastened back to Paris, without, however, informing his father of his intention. On a fine summer evening he bent his steps towards his father's house in the Marais: he still wore his pointed hat, and a travelling cloak enveloped his person: a porter who followed him carried his luggage. Without allowing himself to be announced, Tancredi, who loved dramatic effect, rushed into the parlour, where his father was seated reading the newspaper; and throwing back his cloak, discovered himself to the ex-grocer's astonished sight. Good M. Mathieu laid down the paper instantly, and uttered a very deep hem; but as he was not what is called a very nervous man, he did not seem otherwise affected, but kindly welcomed his son; and seeing that he looked as rosy and happy as ever, immediately gave orders for a substantial supper. Tancredi, who was rapturously gazing through the window on the starlit sky of his native city, of course heard or heeded nothing of those material concerns; 'his spirit was far away.'

'Well, Pierre, how did you like Geneva?' asked M. Mathieu, turning towards his son, whom he never called Tancredi.

'All places are alike to the exile; he is everywhere

alone,' moodily answered his son in the words of Lamenais.

M. Mathieu, who saw that Tancredi was still bent on being wretched, remained silent, and took up his newspaper once more.

'I suppose,' resumed Tancredi after a brief pause, 'the malignancy of their hatred is unabated?'

'Of whom are you speaking?' inquired his father with seeming surprise.

'Of M. Jacquemin, his wife, and all those whose ingratitude made me fly my native land.'

'Oh, they are very well, thank you; they were all inquiring after you only last week.'

'I know they hate me; yet I wish them no evil,' replied Tancredi, with the resignation of a martyr. 'I earnestly hope they are happy?'

'They are indeed quite happy,' answered his father.

Tancredi smiled incredulously. 'How can they be happy,' he exclaimed, 'when they are a prey to all the evil passions that disturb mankind! I endeavoured to reclaim and civilise them; I failed in the attempt, but I cannot think them happy!'

'Well,' said his father quietly, 'since you went to Geneva, I have seen a good deal more of them: I at first found them much irritated against you.'

'Ha! I knew it!' triumphantly exclaimed Tancredi.

'But I soon succeeded in pacifying them,' continued his father, without heeding the interruption. Tancredi looked as though he could have gladly dispensed with this instance of paternal solicitude.

'I, moreover, tried to make them happy; not perhaps according to the best manner, but according to that best suited to them.'

Tancredi's features expressed unqualified surprise: he seemed to wait for something else, but his father remaining silent, he at last said, 'Well, sir, I suppose, by making them happy, you mean making them better?' M. Mathieu nodded affirmatively. 'If so,' continued his son, 'pray how did you rid M. Jacquemin of his intolerable selfishness and sordid love of wealth?'

'M. Jacquemin,' quietly answered the father, 'is, as you say, selfish, and fond of money; but he is no miser: he has no objection to spend large sums, provided it is to please himself. Had I advised him, as you did, to divide the wealth he did not need amongst the poor, he would have looked upon me as a madman. When he complained to me of his great ennui, I advised him to settle in business some of his poor nephews and nieces, whom he had always refused to see, lest they should expect anything from him. He at first seemed very much opposed to this plan; but when I reminded him that after his death his fortune must belong to his relations, who would perhaps squander it away, and that it would be more pleasant for him to dispose of it, according to his own fancy, during his lifetime, he quite agreed with me, and immediately took steps to place his eldest nephew in a dyer's business, which he takes great delight in superintending. He has likewise provided for his other relations, with whom he occasionally quarrels, and towards whom he, nevertheless, behaves with much real kindness. He still takes in the papers, and has not discontinued the soirées; but as he now has little leisure, he is glad to lend out the former to his friends, and enjoys the relaxation of the latter much more than formerly: he is, upon the whole, a happier and a better man.'

'Humph!' almost contemptuously exclaimed Tancredi. 'I had embraced all humanity in my plan; yours, I perceive, is confined to making a few persons happy.'

'It is at least the more practicable of the two,' replied his father.

'And I suppose,' continued Tancredi, 'that you also succeeded in reconciling M. Laurent and Madame Legrand; who, with their insufferable love of flowers, and animals, and mutual antipathy, were enough to destroy all harmony wherever they appeared?'

'I did not endeavour to reconcile them,' answered M. Mathieu; 'but when M. Laurent informed me of all he

had to suffer from his neighbour the widow, I advised him to marry her, upon which he told me in confidence that he had been thinking of it for the last ten years, and without waiting for a reply, launched out into her praises. In short, it ended by his requesting me to be the bearer of a letter to her, as he avowed that he could not summon up courage to address her himself. I consented to undertake this task. On reading the letter, which was a very long one, Madame Legrand became greatly agitated, said something about a golden fish, but at last declared that she forgave him everything.'

'But they are not actually married!' exclaimed Tancredi.

'They have been so for the last six weeks,' replied M. Mathieu.

'And do you mean to say,' asked his son, 'that they no longer quarrel?'

'On the contrary, they quarrel every day; but as it may be safely asserted that it is more from the force of habit than from any other motive, they can be said to agree very well upon the whole. Very little is changed in their existence. They live in the same house; Madame Laurent still occupies the second floor with her animals, and M. Laurent the third with his flowers; they enjoy their game of piquet, and its accompanying squabble, every evening; and it is my firm belief that their greatest cause of complaint against you was the attempt you made to deprive them of that pleasure.'

Tancredi turned up his eyes to the ceiling, and in a tone full of indignation, began, 'Who will attempt to fathom the duplicity of man? Who—' Here he became suddenly silent, either overwhelmed by the vastness of the subject of his question, or induced to hold his peace by the aspect of the supper on the table.

Several days elapsed before Tancredi could be induced to accompany his father on a visit to M. Jacquemin. He at last expressed his consent, by declaring himself 'ready to face his enemies.' His father, who had learned to understand his enigmatical mode of speech, required no more. They accordingly called on the retired dyer the same evening: the Bonnets, Laurents, and De Lorrains, were all present; they seemed delighted to see our hero, and received him with the greatest cordiality. When his father commented on this circumstance, Tancredi smiled bitterly, and muttered something about the serpent being hidden by flowers. But the truth was, that since M. Mathieu had given M. Jacquemin's guests to understand that his son's mind had been somewhat disturbed by certain visions, prevalent amongst the youth of France, their anger had been turned into pity, which they now openly expressed. But of this Tancredi saw, or would see, nothing: they had hated him three months back, they must hate him still; and with this soothing unction to his wounded pride, he endeavoured to comfort himself.

Several years have elapsed, and no important change has occurred in the bosom of the little society we have attempted to portray. M. Jacquemin has forgotten the name of ennui since he followed his friend M. Mathieu's advice; his poor relations are in a thriving condition, and seem to feel much gratitude for his kindness. M. Bonnet still menaces his friends with an impending European war; but it has been noticed that they have now become quite accustomed to the prediction. Madame Bonnet, whose thoughts are all bent on matrimonial alliances for her daughters, has entirely forgotten Abdel-Kader. M. and Madame Laurent quarrel less every day; it is strongly suspected by their friends that the time will come at last when they will not quarrel at all! The only great event which has occurred concerns the De Lorrains; it seems that, after all, they were immensely rich. A lawsuit, which lasted for several years, had prevented them from entering into the enjoyment of their fortune. The old hotel is shut up: its inhabitants have removed to a fashionable neighbourhood, where they live in style, and keep their carriage. Circumstances have wonderfully altered their outward appearance. They all have quite a bold and

prosperous air. They frequently invite their former patrons to their parties; but either the Jacquemin set are hurt at the long deception practised upon them, or they have not yet made up their minds to forgive the De Lorrains their sudden and unexpected prosperity; for, with the exception of the first invitation, which they only accepted out of curiosity, they have declined all other requests, taking in high dudgeon the splendour of the entertainment offered to them. It is, nevertheless, suspected that they will relent in time, if not for their own sakes, at least for that of their children, to whom, as Madame Bonnet observes, they will of course feel desirous of securing the comfort of a rich acquaintance. But Madame Laurent, who still entertains a grudge against her neighbour, declares that she has other designs on the De Lorrains, and is determined to keep her eye upon her. We must not forget to record that several of the old ladies have been cut away by the remorseless hand of death. It is worthy of notice, that those who still survive have never been able to forget Tancredi's unlucky likeness to Marat; they evidently look upon this circumstance as very suspicious.

This brings us naturally to our hero. Of him we have very little to say. He is, to all appearance, as rosy, and happy-looking, and miserable in reality as ever. His father, nevertheless, asserts that he has of late manifested symptoms of change. His hat is not quite so pointed, his shirt-collar is no longer Byronian, and his hair has actually been cropped quite close by the neighbouring hairdresser, who declares that he only followed his positive orders. But what looks more ominous still is, that the name of Tancredi has vanished from his cards, which now only bear plain P. Mathieu. Whatever may be the causes of this change—and whether it is to be attributed to his failure in not being able to become a persecuted man, or whether there is some other motive for it—it seems, nevertheless, very probable that a crisis in P. Mathieu's character is at hand. Some persons have been found who begin to think, like his father, that he may, after all, settle down into a sober, sensible individual: a supposition the more probable, that he actually has been heard to talk of marrying, and entering into business; and that, after all, his youthful follies were more fit subjects for good-humoured ridicule than for real apprehension—a remark which many individuals have actually applied to the Young France party itself.

PRINCE DEMIDOFF'S TRAVELS.

SINCE the multiplication of locomotive facilities, books of travels are said to have become very prosaic and commonplace affairs: nothing new or wonderful is to be seen or described. For those, however, who can dispense with the highly-stimulating qualities so often sought for in such works, the accounts of modern travellers, when not written in a mere guide-book spirit, will not be without interest. The man of science or the philosopher will see objects which the ordinary observer would pass by unnoticed; instances of which we shall find in the travels of the nobleman whose name is prefixed to this article, recently published in Paris.*

M. de Demidoff started from Paris with several associates, among whom were botanists, draughtsmen, and geologists, for Vienna; from whence they descended the Danube to Bessarabia, crossed the Black Sea to Odessa, and after journeys of many thousand wersts in the Crimea and other Russian provinces, keeping in view the scientific objects of the expedition, returned to France to give an account of their labours to the world. In this case, the narrative of the journey—its incidents and adventures—are confined to a single volume, and the scientific details fill the three others of which the work consists. We shall follow the party through the former, making such quotations as may

best convey an idea of its contents. From Pesth the travellers pursue their journey down the river on board the steamer *Francis I.*, a small and inconvenient vessel, whose crew, we are told, composed of as many nations as individuals, obeyed the captain negligently, as might be expected from the necessity of delivering orders in four or five different dialects at the same time. No other sleeping-place was provided than that afforded by the damp deck, or mattresses spread on chairs in the confined cabin, which was infested with disgusting vermin, and served as dining-room, dressing-room, and dormitory. Stopping at the Hungarian village of Mohacs, 'no sooner was the landing-plank safely placed, than a number of women, old and young, miserable and half-naked, crowded the deck. The masculine duties of porters are here devolved upon the women: setting to work with noisy activity, they, wheeled on board the hundred barrow loads of coal for our next day's consumption. These poor creatures, in their costume simple, yet far too short, present decidedly original characteristics. The men, who stood tranquil spectators of the rude labours of the women, wore the usual hats, and large and easy dress of the country. On the black muddy landing-place, an incredible medley of curious spectators was collected—men and ducks, intermingled with vehicles, waiting for passengers.' A day or two afterwards, the party landed to inspect the fortress of Peterwaradin, the Gibraltar of the Danube, while the steamer stopped to leave some merchandise at Neusatz, on the opposite shore. The two places are united by a bridge of boats, and the travellers had scarcely time to accomplish their object, when they saw the vessel approaching the opening made for its passage. 'We were,' to use the words of the narrator, 'fifteen or twenty persons on shore: Jews, merchants, a priest, and a young woman, a Parisian, going to Bucharest. We all ran along the bridge to the place where the boat was to pass; but the *Francis I.*, generally so calm and sedate, shot through the opening like a flash of lightning, and left us far behind in an instant. We were immediately in alarm, believing ourselves abandoned on that dreary spot. The captain had shouted to us to follow him in a boat; the only one to be found was a miserable shell of pine, into which we were obliged to jump from a height of eight feet. I know not what folly seized us, but every one pushed and sprang off at the same time. The fair Parisian would have infallibly pitched into the water, if by a lucky chance she had not fallen heavily upon the priest, of two evils choosing the lesser. At last the boat, laden beyond measure with the trembling and excited crowd that remained standing, was left to the current, which turned it round and round as it drifted down the stream. When near the steamer, whose engine was stopped, all the coolness of a few of the party was needed to overcome the fears of the others, who were not good swimmers, and who, crowding all to one side, would have risked the loss of the whole company. We pacified the more timid by voice and gestures; and when safely on board, I saw the determination plainly imprinted on more than one set of features, never to attempt any more excursions in search of the picturesque, for which captain and crew have so little sympathy.'

Below the dangerous rapids of the Danube, while waiting the arrival of a larger steamer, the party visited the little Wallachian town, Tchernecz, about a league from the river. 'It is little more than one long tortuous street, bordered by stalls and penthouses, which narrow the passage. All the shops are dirty, displaying to the eye of the passer-by articles of food of the most repulsive appearance. It was Sunday, and all the inhabitants were unoccupied. The men squatted at their doors smoking, and the women at a little distance apart, without being completely isolated, sat quite at their ease on the ground on one leg, and, with their chins resting on the raised knee of the other, were lazily conversing with each other. Although strange, this posture is graceful: there is something careless about it,

* *Voyage dans la Russie Méridionale et la Crimée, &c.* Sous la direction de M. Anatole de Demidoff. Paris: Bourdin et Co.

quite in harmony with the languishing physiognomy of the greater portion of the young women. . . . We assisted in a Wallachian dance, full of character and originality: six men, linked together by the arms, and placed in a single line, execute a movement from right to left alternately, with a marching step, simple or complicated, according to the taste and talent of the dancer. The time is marked heavily, to the music of two shrill violins. The two principal performers, those who lead the band at right and left, rest the unoccupied arm upon a tall cane; and it is the part of these leaders especially to impart all the graces and embellishments to this severe and masculine dance. A young Wallachian sergeant acquitted himself in this important task with complete success. Holding his head proudly erect, he moved the whole chain of dancers with his powerful arm, casting from time to time a complacent look at his legs, which he shook with a vivacity and precision always faithful to the measure. The musicians were two gipsies, that numerous and vagabond race, known in Wallachia as Zingania. One of these men was of so remarkable a beauty, that it was not without a lively sentiment of pity we saw the active and skilful sergeant strike him repeated blows with his stick; he, however, expressed no other feeling than that of stupid submission.'

Arriving at Bucharest, 'the city of enjoyment,' M. Demidoff counsels every traveller to pay his first visit to the excellent Turkish baths. 'These establishments, situated for the most part in the district watered by the Dombovitz, combine with the salutary effects of vapour and manipulation all the refinements with which the Orientals have surrounded the physical appliances of life. If the prophet was wise enough to raise a hygienic prescription to the dignity of a religious duty, the true believers, on their part, have been sensual enough to convert it into one of those pleasures to which they abandon themselves with unqualified enjoyment. Nothing can be compared to the soft languor which takes possession of your fatigued limbs when, leaving the tepid vapour, after passing through a vigorous kneading, and a course of aromatic frictions, you find yourself stretched between luxurious sheets, while a pipe exhales around the odoriferous perfumes with which it is charged, and from time to time you are refreshed by the delicious coolness of iced water, coloured with a confection of roses. This beatitude of all the senses is, however, to be purchased at Bucharest for a trifling sum; and it is to be hoped that the French and German usages, continually encroaching on this city, will leave unchanged the only two things of which the Turk can boast, the only ones of which Europe may yet envy the civilisation of the East—baths and coffee.'

Bucharest is described as a large and busy city, where the population move about with somewhat more agility than is common in the East; the exterior of the houses, however, is very much dilapidated. A lively sketch is given of the crowds that throng the thoroughfares:—'That which most excites astonishment in this city,' writes M. de Demidoff, 'is the variety of faces and costumes, changing every instant among so numerous a population. The artisans of Bucharest, the labourers, and porters, do not appear to be afraid of work; but the chief source of life and movement is in the number of Jews by whom the city is inhabited. Active, insinuating, and never discouraged, they make all around them active; for they think nothing of difficulties and fatigues, so long as they have any hope of the smallest recompense. You no sooner see the broad-brimmed hat, and the black threadbare cloak of a Jew, than you may be certain of having at your service, if you will, an adroit, intelligent, and indefatigable steward, whom nothing disturbs, neither anger nor contempt: you may ask him, without fear, for whatever you want; he will answer you in German, Italian, perhaps in four languages; and for a few piastres, leaving all other business, he devotes his suppleness, silence, patience, eloquence, his virtues and vices, his soul and body, entirely

to your service. And if you have once employed an Israelite in any trifling commission or temporary business, do not think it will be easy to get rid of him afterwards: henceforth he is yours, or you his; he will never lose sight of you; he follows twenty paces behind you in the street, and from that distance guesses your wants. He seats himself on the door-step where you enter; and on going out again, his acute look solicits your orders. He goes to sleep on your stair, or under your coach; constitutes himself the servant of your people; salutes your dog in the street; he is at hand, always at hand; you repulse him twenty times with rude blows, but he persists, and keeps near you. Some day, however, from caprice or some other motive, you want him. Scarcely is the thought formed in your mind than he, as it were, rises out of the earth before you, bending in all his humility, in the posture neither erect nor stooping, with submissive mien and attentive ear. This is the Jew's triumph; this is the moment which he has purchased, often by forty-eight hours of watching, fatigue, and humiliation. Scarcely have you spoken, than you are obeyed, and obeyed with punctuality, ingenuity, and respect. And when, after so much care and self-denial, the poor tattered vagabond receives his dear reward, the piece of money which he has followed, invoked, and been the slave to for some days, you see in his grateful look that he recommends you to the favours of the patriarchs, and is quite ready to resume the same toils for a similar recompense.'

Entering the dreary steppes of the Crimea, the travellers arrive at a post-house, where everything was in disorder. 'The bewildered inmates were moving about in apparent agony, running from room to room as though in extremity. Our arrival was hailed with acclamations; and every voice called out at once to know if, by any means, we could recall a dying woman to life. It was a grave case. On being introduced into the house, I saw,' pursues the prince, 'that the patient, the postmistress, was still in possession of an eminent degree of vital force; and that, if there were danger, it arose only from the effects of a superabundant dinner of the day before. The poor woman, in fact, was half-suffocated, and it was only by some sudden means that she could be saved. A medical inspiration came to my assistance. I had in my coach an excellent preparation of Seidlitz salts, which produced good effects everywhere, and I administered a strong dose to the sufferer. Notwithstanding the innocence of the remedy, my inquietude may be imagined; but after a short interval the medicine operated, and greatly relieved the overloaded stomach. We continued our journey, overwhelmed with thanks and admiration. A great physician could not have done better.'

The party with their escort form a singular procession on their way to Yalka. 'Nine men on horseback and five Tartars on foot composed our picturesque caravan. Our costume was materially changed from the time when our uniforms attracted so much attention upon the Danube. We had already yielded to the Tartar influence, which had imprinted its Oriental character upon our persons and vestments. We were ourselves struck by the strange physiognomy of the cavalcade; the horses on which we rode were low, and of sorry appearance, but the traveller soon learns to appreciate their excellent qualities. Indefatigable, and never disheartened, the smallest amount of repose or of pasture suffices to renew their strength. Their foot is as sure upon the rocky paths and edges of precipices as on the broadest and smoothest roads. Slow and cautious on a descent, they get over an ascent at full gallop. The Tartar saddle is a light but hard frame of wood, covered with a thick leathern cushion; and the rider, seated high, and supported by short stirrups, is so far above the animal, as to have no hold on his flanks. The Tartars, accustomed to this mode of riding, are very firm in the saddle, but a strange horseman requires some time to grow familiar with the novel exercise. We rode along, however, each one flanked by his bag-

gage: one with the portfolios and knapsack of the artist; on the shoulders of another the formidable hammers of the geologist; a third carrying the herbals, fowlingpieces, and the gauze nets so fatal to butterflies. Our pack-horses were laden with provisions, fishing-nets, cloaks, cooking utensils, small barrels of spirit of wine, and the light valises containing our city garments. Such was our grotesque procession, as it began to rise above the horizon of Yalka.

At Cape Fiorente, the Cape Parthenion of the Greeks, one of the travellers narrowly escaped a fatal accident. He had scrambled with a companion down the precipitous face of the promontory, five hundred feet, to examine the strata of which it was composed. On attempting to reascend, by climbing from one rugged projection in the rock to another, overcome by fatigue, he lost consciousness, and was only saved from falling by the energetic efforts of his companion. The unfortunate geologist, it appeared, had placed nearly a hundredweight of specimens about different parts of his person; these, under the pressing exigencies of the moment, were thrown away, and after incredible exertions, the two adventurers arrived safely at the summit, to the great joy of the rest of the party.

All eastern towns are infested with dogs, and Kertch is no exception, being overrun with these useless, noisy, and often ferocious animals. They would soon become masters of the place were no attempts made to diminish their numbers. 'At Kertch the gipsies are the canine executioners. The method they adopt to accomplish their purpose is as follows:—One of these honest Zingania, dressed, in virtue of his public office, in some second-hand cloak, walks through the various streets of the town, dragging by a rope over his shoulder the dead carcase of a dog. He moves slowly along, with inoffensive mien, but watchful eye, concealing an enormous cudgel under his mantle. No sooner does the executioner appear in the streets, than a horrible clamour rises in every quarter from the lean brutes, which recognise their destroyer, and perhaps also his victim. They rush from the houses and yards, following the impassable Zingani with furious howling. He, however, goes calmly on, until, at the fatal moment, one of the most daring comes within reach of his cudgel. Quick as thought follows the blow—a mortal one—which stretches another cur by the side of his slaughtered predecessor. In the evening the gipsy goes and holds out his funeral hand before a magistrate. For every head his fee is twenty-five copecks—about twopence halfpenny.

With this instance of the Oriental method of attacking the health of towns question, we conclude our notice of Prince Demidoff's work. The volumes contain many details, alike interesting to the antiquary, the political economist, and the scientific inquirer, which our limits will not permit us to notice.

THE MERIT OF GOOD HEALTH.

In the *World*, a periodical of the middle of the last century, there is an amusing paper giving an account of an odd gentleman who apportioned his regards amongst his fellow-creatures according as they were hale and vigorous. The essayist, Mr Fitzadam, has gone down to visit a friend in the country; he finds him engaged at backgammon with the vicar of the parish, a robust man about fifty. He is surprised to meet a cold reception from the divine, who, however, warns a little towards him in the course of the evening, and meets him at an early hour in the morning to have a walk over their friend's grounds. We then have this gentleman's whimsicality fully developed.

"These are indeed, Mr Fitzadam, very delightful grounds; and I wish with all my heart that the owner of them was less troubled with the gout, that I might hold him in more respect." "Respect! doctor," said I, interrupting him; "does a painful distemper, acquired by no act of intemperance, lessen your respect?" "It

does indeed, Mr Fitzadam; and I wish in this instance I could help it, for I am under many obligations to your friend. There is another very worthy gentleman in the neighbourhood who presented me to this vicarage, but he has the misfortune to labour under an inveterate scurvy, which, by subjecting him to continual headaches, must of course shorten his days, and so I never go near him."

"I was going to interrupt the doctor again, when a coach-and-six drove by us along the road, and in it a gentleman, who let down the glass, and made the doctor a very respectful bow, which, instead of returning, he passed by him with a stately air, and took no notice of him. This instance of his behaviour, together with the conversation that had passed between us, raised my curiosity to a very high degree, and set me upon asking him who the gentleman was. "Sir," says he, "that unfortunate object is a man of eight thousand a-year estate, and from that consideration he expects the return of a bow from every man he meets. But I who know him, know also that he is dying of an asthma; and as (blessed be God for it!) I am in perfect health, I do not choose to put myself on a level with such a person. Health, Mr Fitzadam, is the only valuable thing on earth; and while I am in possession of that, I look upon myself as a much greater man than he. With all his fortune, he would rejoice to be the poor vicar of —, with my constitution. I pull off my hat to no such persons. Believe me, Mr Fitzadam, he has not many months to live."

"I made no reply to this conversation of the vicar, and he went on thus—"You are an old man, Mr Fitzadam, and I believe were a little fatigued with your journey last night, which I mistook for infirm health, and therefore was wanting in the civilities that I should otherwise have shown you; but your conversation afterwards proved you to be a very hearty man, and I saw you resolved to continue so by your temperance, for which I honour you, and, as I told you then, shall be glad of your acquaintance. It is true you are an old man, and therefore my inferior; but you are healthy and temperate, and not beneath the notice of much younger men."

"In this manner we walked on, till we came to a hedge, where some labouring men were repairing the fences. My companion accosted them with the utmost complaisance and good nature. "Ay," says he, turning to me, "these are men worth mixing with. You see their riches in their looks. Have you any of your lords in town, Mr Fitzadam, that have such possessions? I know none of these lords," says he, "myself, but I am told they are all so sickly and diseased, that a man in health would scorn to pull off his hat to them." He then entered into a familiar conversation with the men, and after throwing them sixpence to drink, passed on.

"There now overtook us in the lane a company of sportsmen setting out for the chase. Most of them saluted the doctor as they passed. But he took no notice of any of them but one, whom he shook hands with over the hedge, and told him he intended taking a dinner with him the next day. "That gentleman," says he, "is worth as much health as any man in England; he hunts only by way of exercise, and never takes a leap where there is the least danger. But as for the rest, they are flying over every hedge and gate in their way; and if they escape broken necks in the morning, they are destroying themselves more effectually by intemperance in the evening. No, no, Mr Fitzadam, these are no companions for me. I hope, with the blessing of Heaven, to outlive a score of them."

"We came soon after to a little neat house upon the road, where the doctor told me lived a very agreeable widow lady to whom he had formerly paid his addresses. "She had at that time," says he, "as large a fortune of health as any woman in the country; but she has since mortgaged it to the apothecary for alop, and I have taken my leave of her. She was determined to be a

widow, and so married an officer, who had his head knocked off at Fontenoy. Those are a sort of men that I make no acquaintance with; they hold their lives on too precarious a tenure." "But they are useful members of society," said I, "and command our esteem." "That may be, sir," returned the doctor; "and so are miners in our coal-pits, who are every hour in danger of being buried alive. But there is a subordination of degree, Mr Fitzadam, which ought strictly to be observed; and a man in ill health, or of a dangerous profession, should not think himself on a level with people of sound constitutions, and less hazardous employments."

"I was determined to interrupt the doctor no more, and he went on thus.—"Mr Fitzadam, you may possibly think me an odd kind of a man, but I am no enemy to people of bad constitutions, nor ever withhold my bounty from them when their necessities demand it; but though I am doing them all the services in my power, I cannot consent to lower myself so far as to make them my companions. It is more in the power of the physicians to confer rank, for the gifts of fortune are nothing; health is the only riches that a man ought to set a value on; and without it, all men are poor, let their estates be what they will. If I differ from the common opinion in this particular, I do also in another. The tradesman or mechanic who has acquired an estate by his industry, is seldom reckoned a gentleman; but it was always my sentiment, that a man who makes his own constitution, has more merit in him than he that was born with it: the one is the work of chance, the other of design. And it is for this reason that I am seen so often with your friend; for though the gout is generally an impoverishing distemper, yet temperance and regularity may in time subdue it; whereas the gentleman who drove by us with six horses has an incurable asthma, which renders him, with his large estate, as poor as the beggar who is dying under the hedge. The more you think of these things, Mr Fitzadam, the more you will be of my opinion. A poor man in health is a companion for a king; but a lord without it, is a poor man indeed. And why should he expect the homage of other people, when the very meanest of his domestics would refuse to change places with him?"

"My companion was stopped short in his harangue by our arrival at my friend's house. We found him in good health and spirits, which greatly heightened the vicar's complaisance; and as I took care to conceal from him the complaints and infirmities of old age, I passed a very agreeable week, and was so much in his good graces, that at my departure he presented me with some Turlington's balsam, and a paper of Dr James's powder. "There," says he, "they may rob you of your money if they please, but for bruises and fevers you may set them at defiance."

It occurs to us that there is a deep moral under all this drollery. Health is the primary ordination of nature. Diseases and infirmities only exist by reason of violations of that decree. There is, therefore, a presumption in favour of the man who is healthy, that he has acted a wise and rational part; whence of course arises merit, and praise is due accordingly. Perhaps one reason why we are not in the custom of commending a man for good health, is the fact that so many of us act in a way to produce the contrary condition, and feel that praise of the robust would be our own condemnation.

When we hear a man complain of his headaches or his dyspepsia, and know that his ailments are the unavoidable result of his inordinate application to business—which application is for no better object than to enable himself or his children to live in a handsomer house, and make a greater dash in the world—is sympathy truly due to him? Is not his loss of health, on the contrary, the very measure of his moral delinquencies, and a reason for putting upon him the stigma due to covetousness and mean ambition?

When a lady tells us by the words of her mouth, and

the paleness of her cheek, that she is entirely out of health, is she truly entitled to pity, if we know that the evil is solely owing to the artificial, erroneous way in which she persists in living, contrary to all good advice upon the subject? It rather appears to us that she incurs a just odium, as one guilty of a kind of daily suicide.

Can an elderly man, bankrupt in bodily power, and full of vexing ailments, in consequence of his acting the debauchee in youth, with any face demand such compassion as we feel to be due to unforeseen misfortune? Are not his troubles rather the simple exponent of his vices, and a ground for something like that disrespect in which the vicar held the sportsmen?

Some are weakly or sickly in consequence of hereditary qualities. But if we may be proud of an ancestry for its rank, wealth, or unvarying good conduct, may we not also take some pride in one which has sent us a good constitution and a natural stock of health? And is it not, on the other hand, a discredit to be come of people who have, by their transgressions or neglect, incurred unsoundness, whether in body or mind? Even those diseases which, being endemic, may befall any of us—is there not a demerit connected with them, though of a more general nature, seeing that they come from a traditory virus or miasma, which only expresses some horrible error of life in former generations of our race?

What is here said is not to be held as preclusive of the obvious fact, that bad health often arises in spite of every meritorious effort and care to the contrary. We may admit this, and yet keep in view that unhealthiness is more generally a preventible evil, and one incurred through our own fault.

But is there to be no relenting towards those who suffer from their own errors? Forbid it every beautiful emotion of our social nature! And it is so forbidden. Never will even the most direct cases of human woe, as a consequence of error, fail to draw the pitying tear and the soothing kindness. But let the error be at the same time seen and condemned, and never let the merit of good health be lost sight of in the ruth we show towards those by whom it has been voluntarily forfeited.

A PAINTING THREE MILES LONG.

THERE was a young lad of fifteen, a fatherless, moneyless youth, to whom there came a very extraordinary idea, as he was floating for the first time down the Mississippi. He had read in some foreign journal that America could boast the most picturesque and magnificent scenery in the world, but that she had not yet produced an artist capable of delineating it. On this thought he pondered, and pondered, till his brain began to whirl; and as he glided along the shores of the stupendous river, gazing around him with wonder and delight, the boy resolved within himself that he would take away the reproach from his country—that he would paint the beauties and sublimities of his native land.

Some years passed away, and still John Banvard, for that was his name, dreamed of being a painter. What he was in his waking, working moments, we do not know—probably a mechanic; but, at all events, he found time to turn over and over again the great Thought that haunted him; till at length, before he had yet attained his twenty-first year, it assumed a distinct and tangible shape in his mind, and he devoted himself to its realisation. There mingled no idea of profit with his ambition; and indeed, strange to say, we can learn nothing of any aspirations he may have felt after artistical excellence. His grand object, as he himself informs us, was to falsify the assertion, that America had 'no artists commensurate with the grandeur and extent of her scenery,' and to accomplish this, by producing *the largest painting in the world!*

John Banvard was born in New York, and 'raised' in Kentucky; but he had no patrons either among the

rich merchants of the one, or the wild enthusiasts of the other, whose name has become a synonyme for all that is good, bad, and ridiculous in the American character. He was self-taught, and self-dependent; and when he determined to paint a picture of the shores of the Mississippi, which should be as superior to all others in point of size as that prodigious river is superior to the streamlets of Europe, he was obliged to betake himself for some time to trading and boating upon the mighty stream, in order to raise funds for the purchase of materials. But this was at length accomplished, and the work begun. His first task was to make the necessary drawings; and in executing this, he spent four hundred days in the manner thus described by himself:—

‘For this purpose he had to travel thousands of miles alone in an open skiff, crossing and recrossing the rapid stream, in many places over two miles in breadth, to select proper points of sight from which to take his sketch; his hands became hardened with constantly plying the oar, and his skin as tawny as an Indian’s, from exposure to the rays of the sun and the vicissitudes of the weather. He would be weeks together without speaking to a human being, having no other company than his rifle, which furnished him with his meat from the game of the woods or the fowls of the river. When the sun began to sink behind the lofty bluffs, and evening to approach, he would select some secluded sandy cove, overshadowed by the lofty cotton wood, draw out his skiff from the water, and repair to the woods to hunt his supper. Having killed his game, he would return, dress, cook, and from some fallen log would eat it with his biscuit, with no other beverage than the wholesome water of the noble river that glided by him. Having finished his lonely meal, he would roll himself in his blanket, creep under his frail skiff, which he turned over to shield him from the night dews, and with his portfolio of drawings for his pillow, and the sand of the bar for his bed, would sleep soundly till the morning; when he would arise from his lowly couch, eat his breakfast before the rays of the rising sun had dispersed the humid mist from the surface of the river, and then start fresh to his task again.’

When the preparatory drawings were completed, he erected a building at Louisville in Kentucky, where he at length commenced his picture, which was to be a Panorama of the Mississippi, painted on canvas, *three miles long*; and it is noted, with a justifiable pride, that this proved to be a home-production throughout—the cotton being grown in one of the southern states, and the fabric spun and woven by the factory girls of Lowell. What the picture is as a work of art, we shall probably have an opportunity of ascertaining personally, as it is understood to be Mr Banvard’s intention to exhibit it in England; but in the meantime we must be satisfied to know that it receives the warmest eulogiums from the most distinguished of his own countrymen, and a testimony in favour of its correctness from the principal captains and pilots of the Mississippi. At a meeting in Boston in April last, General Briggs, governor of Massachusetts, who was in the chair, talked of it with enthusiasm as ‘a wonderful and extraordinary production;’ and Mr Calhoun, president of the senate, moved a series of resolutions expressive of ‘their high admiration of the boldness and originality of the conception, and of the indefatigable perseverance of the young and talented artist in the execution of his Herculean work;’ and these, being warmly seconded by Mr Bradbury, speaker of the House of Representatives, were carried unanimously.

The Mississippi is thus described in general terms in a pamphlet descriptive of the panorama:—‘The Mississippi commences in many branches, that rise, for the most part, in wild rice lakes; but it traverses no great distance, before it has become a broad stream. Sometimes in its beginnings it moves, a wide expanse of waters, with a current scarcely perceptible, along a marshy bed. At others, its fishes are seen darting over

a white sand, in waters almost as transparent as air. At other times it is compressed to a narrow and rapid current between ancient and hoary limestone bluffs. Having acquired, in a length of course, following its meanders, of three hundred miles, a width of half a mile, and having formed its distinctive character, it precipitates its waters down the falls of St Anthony. Thence it glides alternately through beautiful meadows and deep forests, swelling in its advancing march with the tributaries of a hundred streams. In its progress it receives a tributary which of itself has a course of more than a thousand leagues. Thence it rolls its accumulated, turbid, and sweeping mass of waters through continued forests, only broken here and there by the axe, in lonely grandeur to the sea. No thinking mind can contemplate this mighty and resistless wave, sweeping its proud course from point to point, curving round its bends through the dark forests, without a feeling of sublimity. The hundred shores laved by its waters; the long course of its tributaries, some of which are already the abodes of cultivation, and others pursuing an immense course without a solitary dwelling of civilised man being seen on its banks; the numerous tribes of savages that now roam upon its borders; the affecting and imperishable traces of generations that are gone, leaving no other memorials of their existence, or materials for their history, than their tombs, that rise at frequent intervals along its banks; the dim, but glorious anticipations of the future—these are subjects of contemplation that cannot but associate themselves with the view of this river.’

The general width of the river is a mile from bank to bank; but after receiving the Missouri, this diminishes instead of increasing; and the character it has hitherto preserved of serene magnificence, changes to that of a wild and headstrong turbulence. ‘The bosom of the river is covered with prodigious boils or swells, that rise with a whirling motion, and a convex surface, two or three rods in diameter, and no inconsiderable noise, whirling a boat perceptibly from its track. In its course, accidental circumstances shift the impetus of its current, and propel it upon the point of an island, bend, or sand-bar. In these instances it tears up the island, removes the sand-bars, and sweeps away the tender alluvial soil of the bends, with all their trees, and deposits the spoils in another place. At the season of high waters, nothing is more familiar to the ear of the people on the river than the deep crash of a land-slip, in which larger or smaller masses of the soil on the banks, with all the trees, are plunged into the stream. Such is its character from Missouri to the Balize—a wild, furious, whirling river, never navigated safely, except with great caution.’

But the real greatness of the river is not obvious to the traveller. ‘If it be in the spring, when the river below the mouth of the Ohio is generally over its banks, although the sheet of water that is making its way to the gulf is perhaps thirty miles wide, yet finding its way through deep forests and swamps that conceal all from the eye, no expanse of water is seen but the width that is carved out between the outline of woods on either bank; and it seldom exceeds, and oftener falls short of, a mile. But when he sees, in descending from the falls of St Anthony, that it swallows up one river after another, with mouths as wide as itself, without affecting its width at all; when he sees it receiving in succession the mighty Missouri, the broad Ohio, St Francis, White, Arkansas, and Red rivers, all of them of great depth, length, and volume of water; when he sees this mighty river absorbing them all, and retaining a volume apparently unchanged, he begins to estimate rightly the increasing depths of current that must roll on its deep channel to the sea. Carried out of the Balize, and sailing with a good breeze for hours, he sees nothing on any side but the white and turbid waters of the Mississippi long after he is out of sight of land.’

The features of the country through which the river

rolls are greatly diversified 'by wild rice lakes and swamps, by limestone bluffs, and craggy hills; occasionally through deep pine forests, and beautiful prairies; and the tenants on its borders are elk, buffaloes, bears, and deer, and the savages that pursue them.' Then comes the prairie scenery, extending for a hundred miles above the mouth of the Missouri; then the forest scenery of the Ohio; and then the alluvion, broadening from thirty to fifty miles, till at Balize it is supposed to be three times that breadth, and in great part a wilderness of cypress forest, stagnant lakes, and impenetrable cane.

The following is given as life on the Mississippi:— 'The greater part of the commercial intercourse of the country is with New Orleans, by the river Mississippi, in boats. These are so various in their kinds, and so curious in their construction, that it would be difficult to reduce them to specific classes and divisions. No form of water-craft so whimsical, no shape so outlandish, can well be imagined, but what, on descending to New Orleans, it may somewhere be seen lying to the shore, or floating on the river. The New York Canal is generating monstrous conceptions of this sort; and there will soon be a rivalry between the east and the west, which can create the most ingenious floating river-monsters of passage and transport.

'But the boats of passage and conveyance, that remain after the invention of steamboats, and are still important to those objects, are keel-boats and flats. The flat boats are called, in the vernacular phrase, "Kentucky Flats," or "Broad Horns." They are simply an oblong ark, with a roof slightly curved from the centre, to shed rain. They are generally about fifteen feet wide, and from fifty to eighty, and sometimes a hundred feet in length. The timbers of the bottom are massive beams; and they are intended to be of great strength, and to carry a burden of from two to four hundred barrels. Great numbers of cattle, hogs, and horses are conveyed to market in them. We have seen family boats of this description, fitted up for the descent of families to the lower country with a stove, comfortable apartments, beds, and arrangements for commodious habitation. We see in them ladies, servants, cattle, horses, sheep, dogs, and poultry, all floating on the same bottom; and on the roof the looms, ploughs, spinning-wheels, and domestic implements of the family.

'Much of the produce of the upper country, even after the invention of steamboats, continues to descend to New Orleans in Kentucky flats. They generally carry three hands, and perhaps a supernumerary fourth hand—a kind of supercargo. This boat, in the form of a parallelogram, lying flat and dead in the water, and with square timbers below its bottom planks, and carrying such a great weight, runs on a sand-bar with a strong headway, and ploughs its timbers into the sand; and it is of course a work of extreme labour to get the boat afloat again. Its form and its weight render it difficult to give it a direction with any power of oars. Hence, in the shallow waters, it often gets aground. When it has at length cleared the shallow waters, and gained the heavy current of the Mississippi, the landing such an unwieldy water-craft, in such a current, is a matter of no little difficulty and danger.

'All the toil, and danger, and exposure, and moving accidents of this long and perilous voyage, are hidden, however, from the inhabitants, who contemplate the boats floating by their dwellings on beautiful spring mornings, when the verdant forest, the mild and delicious temperature of the air, the delightful azure of the sky of this country, the fine bottom on the one hand, and the romantic bluff on the other, the broad and smooth stream rolling calmly down the forest, and floating the boat gently forward, present delightful images and associations to the beholders. At this time there is no visible danger, or call for labour. The boat takes care of itself; and little do the beholders imagine how different a scene may be presented in half an hour. Meantime, one of the hands scrapes a violin, and the

others dance. Greeting, or rude defiance, or trials of wit, or proffers of love to the girls on shore, or saucy messages, are scattered between them and the spectators along the banks. The boat glides on until it disappears behind the point of wood. At this moment, perhaps, the bugle, with which all the boats are provided, strikes up its note in the distance over the water. These scenes, and these notes echoing from the bluffs of the noble Mississippi, have a charm for the imagination, which, although heard a thousand times repeated, at all hours and positions, present the image of a tempting and charming youthful existence, that naturally inspires a wish to be a boatman.'

The scene at a landing-place towards the evening is striking. 'The boats have come from regions thousands of miles apart. They have floated to a common point of union. The surface of the boats covers some acres. Fowls are fluttering over the roofs, as invariable appendages. The piercing note of the chanticleer is heard; the cattle low; the horses trample as in their stables; the swine utter the cries of fighting with each other; the turkeys gobble; the dogs of a hundred regions become acquainted. The boatmen travel about from boat to boat, make inquiries and acquaintances, agree to "lash boats," as it is called, and form alliances to yield mutual assistance to each other on the way to New Orleans. After an hour or two passed in this way, they spring on shore, to "raise the wind" in the village. If they tarry all night, as is generally the case, it is well for the people of the town if they do not become riotous in the course of the evening; in which case, strong measures are adopted, and the proceedings on both sides are summary and decisive. With the first dawn, all is bustle and motion; and amidst shouts, and trampling of cattle, and barking of dogs, and crowing of the fowls, the fleet is in half an hour all under weigh; and when the sun rises, nothing is seen but the broad stream rolling on as before. These boats unite once more at Natchez and New Orleans; and although they live on the same river, it is improbable that they will ever meet again on the earth.'

A stranger is surprised, it is added, by the mode of travelling in steamboats on this mighty river. 'He contemplates the prodigious construction, with its double tiers of cabins, and its separate establishment for the ladies, and its commodious arrangements for the deck passengers and the servants. Overhead, about him, and below him, all is life and movement. He contemplates the splendour of the cabin, its beautiful finishing of the richest woods, its rich carpeting, its mirrors and fine furniture, its sliding tables, its bar-room, and all its arrangements for the accommodation of a hundred cabin passengers. The fare is sumptuous, and everything in a style of splendour, order, and quiet, far exceeding most city taverns. You read, converse, walk, or sleep, as you choose. You are not burdened by the restraint of useless ceremony. The varied and verdant scenery shifts about you. The trees, the green islands, the houses on the shore, everything has an appearance, as by enchantment, of moving past you. The river-fowl, with their white and extended lines, are wheeling their flight above you. The sky is bright. The river is dotted with boats above, beside, and below you. You hear the echo of their bugle reverberating from the woods. Behind the wooded point, you see the ascending column of smoke rising over the trees, which announces that another steamboat is approaching you. The moving pageant glides through a narrow passage, between an island thick-set with young cotton woods—so even, so beautiful, and regular, that they seem to have been planted for a pleasure-ground—and the main shore. As you shoot out again into the broad stream, you come in view of a plantation, with all its busy and cheerful accompaniments. At other times, you are sweeping along for many leagues together, where either shore is a boundless and pathless wilderness. A contrast is thus strongly forced upon the mind, of the highest improvement and the latest pre-eminent invention

of art with the most lonely aspect of a grand but desolate nature—the most striking and complete assemblage of splendour and comfort, the cheerfulness of a floating hotel, which carries perhaps hundreds of guests, with a wild and uninhabited forest, it may be a hundred miles in width, the abode only of bears, owls, and noxious animals.'

Such are the impressions an American receives from the vast Mississippi; and we think it useful to present them here, by way of contrast to the caricatures of European travellers. But Mr Banvard's panorama, when it comes, will enable us, at all events, to judge for ourselves of the physical aspect of the river, and of the boats, and appearance, grouping, and costume of the passengers. We think, however, we may venture to assure him that his exhibition will be viewed with interest by 'the old country' from better motives than those of mere curiosity.

FRESH FACTS ABOUT ETHER.

A SHORT time since, when etherisation was first brought into notice in this country, we gave a short account of the process and of its effects. During the period which has elapsed since then, a number of interesting additional circumstances relating to the process have appeared, from which we design to select a few, in order to complete our notice of this wonderful and all-important discovery.

The apparatus may first engage our attention. The principles of the apparatus formerly described, have found a wide development in the multitude of mechanisms now to be seen in every instrument-maker's window, under the title of 'Ether Inhalers.' An important improvement has, however, been made upon them by an ingenious chemist in the metropolis, which was exhibited at the scientific *soirée* recently noticed in this Journal. The ethereal vapour, if administered undiluted, can scarcely be breathed by any one without producing an irritating and annoying cough, and frequently this so materially interferes with the process, as to cause the patient to reject the vapour altogether, and prefer the endurance of unalleviated pain. It was also feared that the pungent acrid character of the vapour might do an injury to the lungs of delicate persons, if inhaled at once in its full strength. To obviate these effects, a two-way tap has been applied to the flexible tube through which the vapour is inspired, the effect of which is in a very simple manner completely regulative of the strength of the inspired vapour. By this contrivance the patient at first breathes little else than pure atmospheric air; by gradually turning the tap, less and less air gets admission into the tube, and more of the ether vapour, until at length the patient is drawing in, with all the eagerness this mysterious fluid inspires, the ether vapour, pure and strong, from the midst of the saturating sponge. When the full effect is produced, the tap is turned half-way back again, and thus a mixture of equal parts of air and vapour are supplied for the continuance of the process, if it is requisite to prolong it beyond two or three minutes. The remarkable simplicity of this addition is not less striking than its immense value. The second improvement is the administration of the vapour at an elevated temperature, by an instrument invented by Dr Snow. This apparatus is made entirely of tin, and when in use, is immersed in water of a proper temperature. The ether produces its effects more rapidly when administered by this means than by almost any other, as the warm vapour influences the system much more readily than when unwarmed. It also obviates the brittleness of glass apparatus; and an inhaler of this kind can be carried in the coat-pocket, so that a practitioner, armed with such an instrument, may carry about a cure for one, at least, of the many ills of which we are inheritors—physical suffering. Beyond these *addenda*, nothing fresh of importance is to be found

among all the simple or complicated contrivances before the scientific world.

A curious chapter might be written upon the various effects of the vapour upon different physiological temperaments. It would contain some striking passages in a true serio-comic spirit. While the ordinary consequence of the inhalation is entire insensibility and prostration of the muscular powers, as formerly described, some singularities have occurred well deserving notice under the title of this paper. These have been principally manifested just at the commencement, or more frequently toward the conclusion of the process, when the patient is rallying from its effects. An old gentleman who had had a tooth extracted, rose from the operating-chair in an angry mood, and exclaimed, 'Now, sir, I will not be dictated to in this manner; and if you question my respectability—No, I'll tell you what—' when he awoke. A gentleman's servant was operated on in a similar manner: he too got up from the chair, and with some excitement shouted out, 'Now, gentlemen, it's all very well, but I won't stand it; and if there is anybody here—' And he proceeded to divest himself of his coat, manifestly desirous of a personal combat with somebody, when he awoke, and behold it was a dream. A boy who had one of his toes amputated, and thereby lost one important auxiliary for the Terpsichorean entertainment he became anxious to enjoy, cried out lustily, 'Come, let us dance the Polka!' Another was seized with the profuseness of affection commonly characteristic of the maudlin tippler, and insisted upon shaking hands all round; after which he melted into a deluge of lugubrious tears, which brought him to his senses. These cases are capable of indefinite multiplication. Perhaps the most curious fact of all in the history of the process, is one which received a slow belief at first, but has again and again been brought under the experience of every operator in extensive practice. We allude to those wonderful instances in which all the faculties exist unimpaired, sensation of pain only being utterly abolished. A person operated on at the Royal Infirmary of Edinburgh affords an amusing, almost incredible illustration of this circumstance. After inhaling the vapour for a few minutes, he began denouncing the whole process as a piece of humbug, and addressing the wondering bystanders, gravely assured them it was a most complete failure: all the while the operation was going quietly on, altogether without his knowledge, and was completed in the midst of his ludicrous protestations that the plan was a miserable delusion: his amazement on the dissipation of the effects of the vapour may be more easily conceived than written. A young man about to have his leg amputated inhaled the ether, and the operation commenced. Not a feature altered, not a fibre quivered, and the operation was like one on a dead body. While the saw was traversing the bone, the poor fellow opened his eyes, as if awakening from a tranquil sleep, and said in a dreamy sort of way, 'You are sawing!' The tone was that of a casual observation from a bystander, not the exclamation of a man who at the instant was losing a limb. A while after, he recovered, and then said he both heard and saw the sawing of the bone, but did not feel it. A lady who was being operated on for a tumour, never once lost her faculties, and even requested a medical friend near her 'not to leave town without calling upon her;' yet she experienced not the slightest pain. Another was taken with a jocosité fit, and winked, laughed, nodded, and took astronomical observations at the wonderers around him. It has been suggested that absolute unconsciousness is not necessary to secure insensibility; and a somewhat enthusiastic writer says he fully anticipates the time when the patient shall sit unconcernedly inhaling his ether, and giving directions as to the operation. We might suggest, perhaps, a few for his consideration. 'There now, cut a little deeper, or you won't make a good stump.' 'That's the wrong tooth; take out the next;' and such-like. The intoxicating agent was at first only suspected to be sulphuric

ether; it is now fully ascertained that such is the case. It is, however, worthy of remark that the ether requires some previous preparation before it is in an appropriate condition for use in the process of inhalation. Some remains of acid, and a little water, are generally to be found in ether sold by the chemists, and these must be removed according to art. The fact has not met with the notice it deserves; but it has been mentioned that a very curious diversity of effects is produced by the pure and the impure ether. When purified by being washed in water, and inhaled, it gave birth to feelings of the most blissful character; when, again, impure ether was inhaled, ideas of horror and gloom filled the mind. The subject deserves further attention.

There are some risks attendant upon the process, the mention of which will, we trust, confine its use in every instance to the direction of a medical practitioner. It may produce a state closely resembling apoplexy, or it may cause a condition called collapse, from which recovery may take place with difficulty, or not at all. Under proper medical superintendence, the process would be instantly arrested on the first appearance of dangerous symptoms; but if it were administered as an amusement, and pushed to the degree of insensibility, danger might arise, and its effects become altogether irremediable. The notion of the explosibility of the patient under its influence, if approached too nearly with a lighted candle, is a mistake: the experiment has been made, a light was held close to the mouth, but no explosion took place. With young children it is also stated there is some risk; but operations have been performed on them without the little creatures either suffering pain, or experiencing any bad consequences afterwards. To those who have inhaled ether for the fun of the thing, as the intoxicating vapour leaves a strong desire for more, we may be permitted to mention a danger of another kind. A gentleman possessed of considerable talent and enlarged intellectual powers having once inhaled ether, and experienced its wonderful expansive effects upon the mind, became possessed with the odd idea that, by occasional inhalations, he could continue to expand his mental powers indefinitely. He applied himself again and again so energetically to the task, as very shortly to require personal restraint. The ether withheld, he recovered; and being liberated, flew to his delusion once more, and is now in a melancholy condition of the most hopeless lunacy.

This important discovery has thrown open a new field of inquiry, or rather has re-opened an old one, before the medical world—the administration of medicines in a volatile state. An institution founded by Dr Beddoes, known as the Pneumatic Institution, existed many years since, in which such agencies were employed, but shortly fell into disrepute. It is yet possible that, in certain cases, and with certain medicines, the practice may now again be revived, but it requires much caution. Not only has etherisation banished pain from some thousands of operations upon the human subject, but, with the true benignant spirit of our day, its soothing influences have been extended to the brute. Horses, cattle, sheep, and dogs have breathed its luxurious atmosphere, and have undergone the most serious operations without evincing any suffering. Some curious experiments have been also made upon the relative tolerance of ether upon birds, quadrupeds, and fish. Gold-fish, linnets, and guinea-pigs have all been made insensible by its means; and on being pricked slightly, appeared unconscious of the injury. As was to be expected from their anatomical structure, birds are most rapidly affected; next to them, quadrupeds; and slowest of all, fish.

The inventors of etherisation could scarcely have ventured even to anticipate some of the remarkable purposes to which their process was to be applied. It has not only been employed in surgery, obstetric medicine, and the veterinary art, but it has also been used in medicine to produce relaxation of spasm, and also for the relief of violent attacks of *tic douloureux*, and pain-

ful affections of the nerves. It has been proposed to produce insensibility also in cases of malingering, where disease is feigned for the purpose of securing a discharge from service. Two cases are related, which show in a curious manner the protection it bestows upon the real, and the detection it affords of the sham invalid. The first was that of a young soldier recently enlisted, who professed his incapacity for military service on account of a diseased hip-joint: he was etherised, and the joint was really found to be stiff and immovable. The second, also a soldier, appeared sadly distorted by an aggravated spinal curvature; he was also made to inhale, and in four minutes his dreadful-looking spinal disease vanished, and his spine became like that of another man. On recovering, his shame and disgrace may be easily pictured.

We thus bring to a conclusion our brief outline of the most prominent recent facts known relative to this invaluable discovery. As it is still only in its infancy, the sphere of its usefulness may reasonably be expected to extend over a much wider department than it has hitherto reached of human misery and suffering.

INDUSTRIAL SCHOOLS.

Those at Aberdeen and Dundee have led to an examination of the subject, which is likely to have great effect. It is by no one taken up with greater enthusiasm than by the Hon. Miss Murray, one of the ladies immediately about the queen, and who has dedicated, by permission, a small book on education to her Majesty and Prince Albert.

This small but important work, like Horace Mann's 'Educational Tour,' will be extensively read. Its object is not so much mental education, as moral training—the one being sure to follow the other. When the late Captain Edward Brenton was establishing at Hackneywick, near London, an institution for changing the character of young male delinquents, Miss Murray was doing the same for females at Chiswick, and she had sufficient influence with Lord Cottenham, when formerly chancellor, to persuade him to draw an act for the purpose of providing for juvenile delinquents. The bill passed the Commons at the end of Lord Melbourne's administration; but the dissolution of the parliament prevented its ever reaching the Lords: still it is upon record, and must work its way. Patience and perseverance generally succeed; and when police shops are shut up, and constables no longer wanted, and prevention of crime substituted for cure by punishment, it can never be forgotten that this admirable lady has been a powerful coadjutor in the cause.

Miss Murray has had recourse to a letter from the celebrated Mirabeau, written in 1785, a copy of which she has put into the hands of many of our public men. It will, however, be well that it should not be limited to private circulation, and on that account it will be generally useful to lay it before the readers of the Journal.

If due attention was bestowed upon the education and training of children belonging to the working-classes, governments might always have the source of the population at their command, and might not only renovate and reform, but give such agricultural knowledge and habits of industry, as would enrich and render their people prosperous. The vices of society are one of the causes which congregate men in cities; but the wisdom of enlightened rule should induce this tide to flow back again into the country, by bringing up the otherwise idle and mischievous population of children in pure and simple habits out of towns; and thus the fruits of corruption will themselves serve to arrest its progress, the mortality of early life will be lessened, and an increased population, instead of being to be dreaded, will be advantageous. The state, by them, and for them, would establish great agricultural colonies, would then value them as a parent in a natural position values his numerous family, not only as domestic treasures, but as the elements also of his future prosperity and of his worldly riches. I know not whether this may be thought a good speculation in England, but it would be one of my main resources in France. The government, in adopting destitute and ignorant children, would have two kinds of legitimate control over them—that of the sovereign, and that of the father; it would have an absolute power over their education, and over the produce of their early labour.

'How many experiments useful to the children themselves, and to the whole nation, might not an enlightened government make in the culture, training, and education of these infant colonists! If there are any means of peopling, reclaiming, and fertilising waste lands in Normandy, Champagne, and the deserts which lie between Bayonne and Bordeaux, I believe these means would be found in turning to account the children now beggars, or confined in the charitable establishments and prisons of the nation.'

When the extent of vagrant mendicancy in Ireland is borne in mind, one might fancy that this letter of the great French orator was the voice of an oracle, pointing out what a government might do. In Ireland there are five counties and seventy large towns without a bookseller's shop. Scotland, with a third of the population, has three times the number of booksellers, being in the proportion of 9 to 3.*

It is to the ignorance of the Irish that their miserable state is to be attributed. The greater half—the mass of the labouring class—have not yet derived any benefit from the discovery of the art of printing: all books are in English, and that language is unknown to them.

Listen to what a highly-esteemed English philosopher has written. Wordsworth, in his poem of 'The Excursion,' says—

'Oh for the coming of that glorious time,
When, prizing knowledge as her noblest wealth
And best protection, this imperial realm,
While she exacts allegiance, shall admit
An obligation on her part to teach
Them who are born to serve her and obey!
Binding herself by statute to secure,
For all the children whom her soil maintains,
The rudiments of letters, and inform
The mind with moral and religious truth,
Both understood and practised; so that none,
However destitute, be left to droop
By timely culture unsustained; or run
Into a wild disorder; or be forced
To drudge through weary life without the aid
Of intellectual implements and tools—
A savage horde among the civilised;
A servile band among the lordly free.
This sacred right the lisping babe proclaims
To be inherent in him, by Heaven's will.

* * *
This sacred right is fruitlessly announced,
This universal plea in vain addressed
To eyes and ears of parents, who themselves
Did, in the time of their necessity,
Urge it in vain; and therefore, like a prayer
That from the humblest floor ascends to Heaven,
It mounts to reach the state's parental ear,
Who, if indeed she own a mother's heart,
And be not most unfeelingly devoid
Of gratitude to Providence, will grant
The unquestionable good; which England, safe
From interference of external force,
May grant at leisure; without risk incurred,
That what in wisdom for herself she doth,
Others shall e'er be able to undo.

Higher individual authority than this cannot be quoted; and although nothing like what was expected has been gained, the events of the last few months have established some important principles:—1st, That it is a duty, as Wordsworth says, 'by statute,' to educate the people. 2d, That education is not limited to mental tuition; industrial habits, as well as teaching in various ways, will be established within a few years. 3d, The instructors, as well as the slayers of mankind, should be pensioned at the end of life, after they have done their work.

SEA-BATHING.

Sea-bathing, on account of its stimulative and penetrating power, may be placed at the head of those means that regard the care of the skin, and which certainly supplies one of the first wants of the present generation, by opening the pores, and thereby reinvigorating the whole nervous system. This bathing is attended with two important advantages. The first is, that besides its great healing power in cases of disease, it may be employed by those who are perfectly well, as the means most agreeable to nature for strengthening and preserving health. In this respect it may be compared to bodily exercise, which can remove

diseases otherwise incurable, and which may be used also by those who are sound in order to preserve themselves in that state. The other advantage is, the noble, grand, and indescribable prospect of the sea connected with it, and which, on those not acquainted with it, has an effect capable of bracing up the nervous system, and producing a beneficial exaltation of the whole frame. I am fully convinced that the physical effects of sea-bathing must be greatly increased by this impression on the mind, and that a hypochondriac or nervous person may be half-cured by residing on the sea-coast, and enjoying a view of the grand scenes of nature which will there present themselves.—*Hufeland.*

NARROW ESCAPE.

Gustavus Count Von Schlabendorf was born at Stettin on the 22d of March 1750. His father was Frederick the Great's minister in Silesia during the Seven Years' War. As the friend of Condorcet, Mercier, and Brissot, he was imprisoned during the Reign of Terror. His conversation and kindness, his generosity and advice, were the comfort of his fellow-prisoners. Schlabendorf escaped death by a sort of miracle. One day the cart came as usual for its freight of victims, and his name was called out. He soon was ready, with the exception of his boots, which could not be found. At length he said to the jailor, 'Without boots, it is quite impossible for me to go. Let us see: you can call for me to-morrow; one day cannot be of much consequence.' The cart proceeded without him. Next day Schlabendorf, ready booted, was waiting; but his name was not called. The jailor was not a brute, and said nothing. Schlabendorf remained in prison ignored until Robespierre's fall.—*Sketches of German Life.*

LENGTH OF THE HUMAN HAIR.

The ordinary length of the hair of the head, as deduced from its measurement in women, ranges between twenty inches and a yard, the latter being considered as unusually long. But in some instances the length is much greater; as in the case of a lady in whom, I am informed, it measures two yards, and trails on the ground when she stands erect. When, however, hair is kept closely shaved, it appears to become persistent, and at the same time increases in strength and bulk. It has been calculated by a curious investigator (Withof) that the hair of the beard grows at the rate of one line and a half in the week; this will give a length of six inches and a half in the course of a year, and for a man of eighty years of age, twenty-seven feet which have fallen before the edge of the razor. Such an amount of growth appears in nowise remarkable, when we learn from Eble that in the prince's court at Eidam there is a full-length painting of a carpenter whose beard was nine feet long, so that, when engaged at work, he was obliged to carry it in a bag; and that the burgomeister, Hans Stominger, having upon one occasion forgotten to fold up his beard, trod upon it as he ascended the staircase leading to the council chamber of Brunn, and was thereby thrown down and killed.—*Wilson on the Skin.*

APPAREL.

A man ought, in his clothes, to conform something to those that he converses with, to the custom of the nation, and the fashion that is decent and general, to the occasion, and his own condition; for that is best that best suits with one's calling, and the rank we live in. And seeing that all men are not Edipuses, to read the riddle of another man's inside, and most men judge by appearances, it behoves a man to barter for a good esteem, even from his clothes and outside. We guess the goodness of the pasture by the mantle we see it wears.—*Feltham.*

EXAGGERATIONS.

Never to speak by superlatives is a sign of a wise man; for that way of speaking wounds either truth or prudence. Exaggerations are so many prostitutions of reputation, because they discover the weakness of understanding, and the bad discerning of him that speaks. Excessive praise excites both curiosity and envy; so that, if merit answer not the value that is set upon it, as it generally happens, general opinion revolts against the imposture, and makes the flatterer and the flattered both ridiculous.—*Asen.*

* These statistics of bookselling appeared in the 'Literary Gazette,' enumerating the towns, with the population of each, and was copied in the 'Times' of the 18th of December.

SCOTTICISMS AND SOLECISMS.

'The plague was in London, but they *wanted* it in Edinburgh,' says the Caledonian, little reflecting on what he is attributing to the people of the latter city. If told of the solecism he had committed, he would probably confess that he *thought shame* of himself, which would only be going wrong in another direction. Tell him so—he adds, 'Surely not; but I will *inquire* at my friend Diphthong the teacher.'

'Wrong again: say, inquire of. You have the example, however, of the Waverley novels before you: your countryman, Scott, always asked a question at a man. But tell me how you are to-day?'

'Oh, *very bad*, sir; *very bad*. I have got a dreadfully sore head.'

'I am sorry to hear you confess your wickedness, but I pity the unpleasant condition of your head. What was it owing to?'

'Oh, at dinner yesterday I took a *few soup*, and they always disagree with me, particularly of *late*.'

'Well, say, a little soup, and that soup has disagreed with you lately.'

'I'll try to remember; but so old a scholar as *me* is ill to learn.'

'So old an instructor as *I*, however, do not find any difficulty in *teaching*. I would fain have you corrected out of those errors you are so liable to fall into.'

'You are very *discreet*. Will I have a lesson from you to-day?'

'With all my heart.'

'Well, don't sit any longer *on the door*, but come into the fire, and let us proceed.'

'As a beginning, then, please to know that I might be kind or civil in offering my instructions, but not *discreet*. You ought to have asked me, "Shall I have a lesson?" And you should have told me to sit no longer *near the door*, but to come *towards* the fire.'

'Oh dear, how many errors! I don't think I can *mind* them all.'

'Remember, my dear sir, if you please.'

'Well, remember. We Scotchmen are certainly greatly *a-wanting* in the English language.'

'Say *wanting* now; and your acknowledgment is a graceful one.'

'I am always very much *put about*, when in London, feeling the liability to speak incorrectly.'

'For *put about*, *incommoded*. A Scotchman is not a ship.'

'Well, I'll *take tent* for the future.'

'What is that you'll take?'

'Oh, I mean I'll pay attention. Thereby hangs a tale. A Scotch physician of *langsyne* was visiting an old lady, whom he was obliged to put under some very strict regulations as to regimen. "Now, *tak tent*," he

several times repeated as he was leaving her; meaning, "Pay attention to my rules." When he came back, a week or two after, he found the old lady almost gone, from a too liberal use of tent wine.'*

'The more need, then, for all of you to *tak tent* not to use so dubious a phrase again.'

'Oh yes, *we behove* to be careful.'

'What is that you say?'

'Oh, it behoves us to be careful.'

'Ay, it behoves you; but you do not behove, seeing, my dear sir, that behove is an impersonal verb. However, I must leave you, for I see it is twelve o'clock.'

'Oh, don't be in a hurry. The clock is *before*: it is only *half twelve* as yet.'

'More errors still. But even though the clock be *forward*, and it is only *half-past eleven*, I must go, having already rather exceeded my time. So good-morning.'

Let us imagine another conversation, the persons different, but their respective countries the same.

'How do you do, Tomkins? Glad to see you north of the Tweed at last.'

'Thank you, my dear friend.'

'What have been your movements?'

'We *left* on Friday last, and came here partly by rail and partly by coach.'

'But what did you leave?'

'Oh, why—what—ah, you're always so funny. We left London to be sure. We arrived in this *here* place last night.'

'Well, I never heard of Edinburgh being a *here* place before. What kind of journey had you?'

'All very well, but that the weather was to cold, and the man *as* drove the coach was rather uncivil. However, our fellow-passengers were *such nice* people. We got *along* with them extremely well.'

'Ah, I'm glad you got along with them. It would have been a great bore to be left with them at any place by the way!'

'Oh, you Scotchmen don't understand English; but I've no fault to you on that account. You can't help it.'

'Of course not. But where do you intend to go? The season is too far advanced, I fear, to allow of your visiting the Highlands.'

'Why, I was not *a-going* to. Besides, my mistress has been. I've *half a mind*, however, to go to Glasgow and the Falls of the Clyde. The Falls are *ever* so fine, I believe. By the way, *them* houses are mighty tall.'

'Yes, eight or ten storeys. We have many others almost as lofty.'

* Sir John Sinclair, in his *Observations on the Scottish Dialect*, published in 1782, says very naively respecting *Tak tent*, 'As that species of wine is far from being a specific in every disorder, this is a phrase which, by the faculty at least, ought to be carefully avoided.'

'By the way, I see you have as many drunken people in the streets as ever. Here comes one very *fresh* indeed.'

'It is odd you should call a drunken man *fresh*. In Scotland, a man is said to be *fresh* when he is sober, as distinguished from being drunk. But both applications of the word are wrong.'

'Well, so I've been told by my friend Johnson in London.'

'Oh, how is Johnson, and what is he engaged in now?'

'Why, the last time I met him he was very well. He told me he is now on the Morning Chronicle.'

'On the Chronicle! Well, the Chronicle has a good load of him, seeing he is not under fifteen stone.'

'Oh, he's a great deal fatter now. Indeed he is so stout, that he is become quite weak in the legs. Calling on me lately, he *laid* down on my sofa the moment he came in. "Johnson," said I, "I'm sorry to see you *lay* there. I fear that beer and the debate have been too severe upon you lately?" At which he fell a-laughing. Ah, he is a real good fellow is Johnson.'

'I hope he prospers in his calling?'

'Oh, *getting* on famously. Hard worked, I daresay; but he *lays* his account with it. The last thing I heard of him was, that his wife's brother, a dreadfully rich fellow, had taken his son Alfred to *do for* him.'

And so forth. Now for a third conversation, with similar interlocutors, but both well-educated men.

'Your countrymen in Scotland are making great advances in the acquirement of correct English; but the Scotticisms still cling to you. Never do the very best of you entirely overcome the tendency to that kind of error.'

'Why, I'm not quite sure that you English are just to us in this respect. We are addicted to the use of many wrong phrases and forms of speech no doubt, but so are the provincial English—*namely*, even Londoners of the middle class; and it seems too bad to single out the Scotch for remark. I assure you we observe in the English—excepting only the most highly-educated class—a vast number of improprieties which do not beset our countrymen.'

'That may be; but I do not think there is any reproach meant. It only happens that you do commit many solecisms, and that an apt term for them has arisen.'

'I am quite sure that the English people are too good-natured to mean any offence. It would, therefore, be absurd to take any. But let us see now. There is a considerable number of so-called Scotticisms, about which, I think, some little doubt may be entertained, or which are represented by English phrases that appear to me no better.'

'Give me some examples if you please.'

'I shall, very willingly. A Scotchman, you are aware, speaks of having a watch *on* him, while an Englishman says *about* him. Now, it appears to me that a watch may more justly be said to be *on* a man, than *about* him. A Scotchman meets a friend on the street, at which the Englishman exclaims, "For Heaven's sake, say in the street!" But I more than suspect that *on* is the better phrase, seeing that the street is primitively the way or road; the Roman roads through England were all streets, though there was not a house upon them.'

'At least your second case is plausible.'

'But I have more cases. "Out of his judgment," says the Scotchman respecting an insane person. "Out of his senses," cries the Englishman, by way of correction. Now, I say that an insane man may more justly be described as out of his judgment than out of his senses. His senses, indeed, have nothing to do with the matter, except in being more or less affected, as it may happen, by the failure of the understanding.'

'I can't pretend to resist your reasoning on this point.'

'Again, a Scotchman is challenged for saying, "I'll cause my friend to join me in this undertaking." The Englishman tells him he ought to say *make*, instead of

cause. But *cause* is in this case a much clearer and more correct phrase than *make*. The Scotch have a phrase of their own, which is better still: they say, "I'll *gar* my friend;" but as this is not in court, I'll say no more about it. So also we see "To *follow* out a train of reasoning," adduced as a Scotticism in the grammatical books, while it is impossible for me to find the least objection to it, or to discover the superiority of the equivalent English phrase, "To *trace* out," &c. In bread and milk, and bread and butter, there may be some slight advantage over the contrary collocation, in which the Scotch indulge; but what preference there is in the vinegar and pepper, for pepper and vinegar, or pen, ink, and paper, for paper, pen, and ink, I cannot perceive or imagine. Neither can I see any advantage in sugar-basin over sugar-bowl: indeed the utensil is generally much more like a bowl than a basin, and certainly our associations regarding bowls are more pleasant than those regarding basins. The head of the table, the foot of the table, I grant, are inappropriate phrases for what they are applied to; but can it be said that the English phrases, top of the table, bottom of the table, are more suitable?'

'Oh, but custom is everything in these cases. We constantly say, top of the table; sugar-basin; pen, ink, and paper; and so forth; and therefore any departure from these rules appears awkward.'

'Yes, but the question is, whose customs are to be observed? You do not consider the Frenchman guilty of a solecism because he speaks of surveying a man from foot to head—why, then, a Scotchman for similar peculiarities?'

'Well, if you are content to be aliens in language, I suppose you may be excused.'

'Thank you. I see the joke. But I am not done yet. There are some of these reprobated phrases which seem to me rather to be rejoiced in than otherwise. For instance, a Scotchman uses *enow* as an adjective for enough. "There are *enow* of potatoes to serve us all." This, I humbly submit, is a positive gain in language, seeing that it gives us the special word for the special idea. So also it is well for the Scotchman to have *swatch* for a pattern or sample, as applied to cloth, both pattern and sample being in use to express other ideas. The *airt* of the wind, for the *direction* of the wind, seems greatly preferable; both because it is a peculiar word, and because it refers to the point from which the wind comes. So also to *airt* a business, to be *airt* in it—that is, to guide a business, or have a share in directing it—seem good and eligible phrases. Allow me here to quote an anonymous writer of the last century. "We are taught on no account to make use of the word *byre*, to denote a house appropriated to the keeping of cows. In its stead we are taught to say *cow-house*, or *stable*, whichever we please. But if I use the word *stable*, I force a word which has a precise and appropriate meaning—namely, a house for keeping horses—to express another meaning, which tends only to occasion ambiguity and mistake; and if I use *cow-house*, it is certainly a degradation of the language, tending to impoverish it. By the same rule we ought to banish from the language the appropriate phrases, *stable*, *kennel*, *sty*, *granary*, *scullery*, *laundry*, and in their place say, *horse-house*, *dog-house*, *hog-house*, *grain-house*, *dish-washing-house*, *clothes-dressing-house*; and so on."

'I cannot deny that there is much force in all this; but surely I need not tell you that it is in vain to interfere with fashion in these matters?'

'Yes, but I will interfere with fashion; at least I will show you where I think fashion is wrong. I think her so in more respects than in the rejection of valuable words. Sometimes she makes gross corruptions in words which the so-called vulgar continue to use correctly. For example, we have now *nettle-rash* for the *nettle-rush*; the *scarf-skin* for the *scurf-skin*: changes utterly indefensible. The *epidermis* is entitled to the denomination of *scurf-skin*, from its being the deposi-

tory of those minute scales which we recognise as scurf. Scarf, signifying a loose vestment, can obviously have no concern in the case. The disease of rash is liable to that term, by reason of its being a thing that rushes out. The word rash, in such a case, is mere nonsense. There are many such corruptions; and I can imagine no class more worthy of reprobation, seeing that they take their rise with those who, from their superior education, might be expected to be the guardians of the language.

So let the debate end. After all, language must ever be full of anomalies. Taking its rise during the ignorance of a people, it must necessarily involve many improprieties, too deeply woven into the texture to be separated. By and by, literature comes to steady and preserve it. Yet, even after that, a natural tendency to new phrases is perpetually seen at work amongst almost all classes: right or wrong, they force their way into recognition. Grammarians, being for the most part only finical about their little rules, fail in general to apprehend the natural forces which give birth to the expressions which they condemn as uncouth and wrong. Almost all those expressions could be shown to take form from some laws or plans of thought to which our minds are subject. So also do they treat such peculiarities as those called Scotticisms on too narrow a basis; not only failing to see the laws of thought at the bottom of them, but entirely overlooking the fact, that the people of the various Anglo-Saxon provinces, having come from different portions of the cradle-country in Teutichland, differences in their forms of speech may rather be mere diversities, than things standing in the relation of a standard and a departure from it.

THE CONTRABANDISTA.

A MEXICAN TALE.

IN the course of my travels along the western coast of Mexico, I found myself in the old city of Hermosillo, formerly capital of the province, which contains at the present time about seven thousand inhabitants. It is built on a plateau, sloping on one side to the ocean, and on the other terminating abruptly in the rocky cliffs bounding the Gulf of California, fifteen leagues distant. The navigation of the latter is difficult, in consequence of the rocks and reefs, which seem to forbid approach to the shore; from which circumstance it is a favourite resort of the smugglers or *contrabandistas*, as they are called in the country, who, while the 'duty-paid' merchandise is finding its way to Hermosillo in one direction, introduce their own illegal commodities on the other; a species of traffic which, notwithstanding the rigorous laws against it, finds friends in every part of the Mexican territory. Smuggling, in fact, is not confined, as in Europe, to a few bold adventurers, but, in proportion to the abundance or deficiency of funds in the public treasury, is shared in by all the officials of the government, from the highest to the lowest, as a means of compensation for uncertain pay.

Among the letters of introduction which I had brought with me to Hermosillo, was one addressed, '*Al Senor Don Cayetano*;' and after completing my most pressing business affairs, I inquired of my landlord, a Chinese, if he could give me any information respecting the *senor*. 'I know him,' was the answer, 'only to buy caymans' eggs and sharks' fins of him, things which I greatly relish; and which you shall taste some day, if *Senor Don Cayetano* should take it into his head to take a turn upon the lagoons, or a little cruise at sea. But if you wish, *Senor Cavalier*, I will undertake to convey the letter to him?'

I accepted the offer, at the same time asking—'And this is all you know about him?'

'All,' replied the Chinese, 'except a peculiarity that is talked about, but of which I am not certain, as I have been here only six months. It is said, however, that *Don Cayetano* cannot bear the sound from the

Cerro de la Campana with tranquillity: the noise exasperates him; and when he is exasperated, he is—he is very impetuous. That is all I know, *Senor Cavalier*.'

Some days after this conversation, I walked to the top of the *Cerro*, a hill overlooking the town, and the only natural curiosity in the neighbourhood. The summit is crowned by several enormous blocks of stone, which, when struck, emit a clear metallic sound, that may be heard at a considerable distance, according to the wind. Having amused myself for some time by looking at the view, and awakening a few of the slumbering echoes, I descended slowly, as the sun disappeared, to the town, which, in the coolness of the evening, began to rouse from the lethargy produced by the heat of the day. Rockets rose in various quarters, describing their luminous curve in the air; fires of resinous wood, burning on iron tripods, shone brightly through the deepening twilight; while the cries of the venders of tamarind and rose-water, the clack of castanets, and the twang of guitars, mingling with the buzz of voices, formed a striking contrast to the previous quietness.

On entering the town by a narrow street, my attention was attracted by the chink of silver coin as I passed a small low house, probably one of the numerous gaming establishments so common in the South American states. Seeing through the window a group of men round an oval table, I entered. No one seemed to remark my entrance, so deeply were they interested in the casting of the dice. Among the players and spectators were to be seen representatives of every class of Mexican society; the greater part, however, wearing garments of coarse calico, which left their breasts and arms bare, showing the long and serpentine scars of the wounds received in their frequent duels, fought with knives, and whose countenances, seen beneath their thick and tangled hair, were enough to make an honest man shudder. After looking round for a few moments, an exclamation from one of the two players at the table, in whose hands the game appeared to be left, attracted my notice. The speaker was a tall and powerful man, cast in the mould of an athlete; his features were tolerably regular, but disfigured by an ugly scar down one side of his face from the forehead to the chin. With a malediction on the unknown individual who had been ringing the stones on the top of the *Cerro* as the cause of his loss, he seized his opponent's purse, and walked coolly from the room. In the second player I recognised a senator whom I had met elsewhere. He seemed somewhat disconcerted on seeing me; and coming hastily forward, endeavoured to account for being found in such company, by telling me that they were his constituents. With a glance at the group of villainous-looking countenances, I congratulated him on the respectability of his electors; and inquiring the name of the individual who had departed so unceremoniously, heard, much to my surprise, that it was no other than *Don Cayetano*. Before we separated, *Don Urbano*—that was the senator's name—made me promise to accompany him and some friends to witness an Indian festival, to be celebrated the next day at some miles' distance in the forest.

The following morning, at sunrise, we mounted our horses, and with *Cayetano* as guide, we rode for some distance across the low marshy ground towards the coast. Numerous lagoons here penetrate far into the land, some smooth and clear as crystal, others hidden beneath the forests of tall reeds, with which the whole region is overgrown, affording a hiding-place to the crafty jaguar and ferocious alligator. Swarms of screaming birds disturb the gloomy silence, mingled with the bellowing of alligators, and the loud sharp clapping, as they beat their tremendous jaws together in defiance. We were riding along a natural causeway, formed by the action of the waves, when *Cayetano*, who was some distance in advance, suddenly galloped at full speed down the slope towards the lagoons. 'By *St Jago*, *Senor Senator*,' said I, 'what is he going to do?'

Don Urbano cast a rapid glance in the direction to which the horseman was hastening, and replied, 'Look yonder; do you see that little field of reeds, not far from the last lagoon? The reeds are shaking, and unless I mistake, not with the wind, but with the movements of some skulking alligator; and as Cayetano has not yet recovered from his nervous excitement, he is probably going in chase.'

The course pursued by the rider, however, appeared to contradict this assertion. Instead of making directly for the reeds, he was moving from them at an angle; but turning all at once to the left, he galloped straight to the spot indicated by the senator. His shout of defiance was answered by an angry growl, as an enormous cayman broke from the covert, and made for the lagoon with all the speed possible under its unwieldy bulk. The black and scaly back of the reptile was almost entirely covered with mud and weeds. In Cayetano's haste to cut off the fugitive's flight to the lagoon, he brought his horse within a dozen paces of the cayman: the animal reared in terror, and tried to turn aside, but a stroke of the spur kept him steady; and at the moment, the lasso, which Cayetano threw with a true aim, encircled the monster's head. The cayman opened its enormous jaws, which appeared armed rather with stakes than teeth, and gave a frightful roar, that made our horses tremble in dismay; but continuing its flight, its mouth was suddenly closed, and held fast by the running noose. For a moment the reptile hesitated whether to turn upon its enemy or push on for the water; urged probably by fear, it chose the latter course; but Cayetano had secured the end of the lasso to the elevated pommel of his saddle by a threefold knot, and the strength of the horse was a countercheck to that of the cayman. For several minutes the two animals pulled with all their strength in opposite directions; the alligator buried its claws furiously in the soft soil, which the horse's hoofs in turn ploughed into deep furrows. There was a brief interval of silence, during which nothing was heard but the clink of the spurs as they dug into the flanks of the panting horse, and the rattling of the cayman's scaly tail as it thrashed the reeds. Twice the horse was raised on his hind-legs by a prodigious strain, and twice the cayman, bent like a bow, showed its belly, changed from white to purple by terror and rage. At last a pull more desperate than the former brought the horse again on his heels, and the noble animal was just falling over on his rider when the girth suddenly snapped. Don Urbano grew pale at the sight of the risk incurred by his most influential elector, while I uttered a cry of alarm; but with the quickness of thought, no sooner did the saddle give way, than Cayetano, seizing the horse's mane, balanced the whole weight of his body on his arms alone, with the address of a circus rider, and an instant after was safely seated on the bare back of the animal.

'Bravo! my brave fellow,' shouted the senator, throwing his cap into the air.

The alligator turned heavily, and disengaging its jaws from the loop, prepared to rush upon its enemy; but with a few leaps the horse carried his master out of danger, and the monster, bellowing with savage delight as the air again entered its lungs, plunged into the water, and disappeared. Cayetano shook his clenched fist over the lagoon, then dismounting composedly, he made a shift to repair the broken girth, and rejoined our party.

'Caramba!' exclaimed the senator; 'what could you be thinking of?'

'I was exasperated,' answered Cayetano. Don Urbano seemed to be contented with this peremptory reply, and we resumed our route. I was, however, so struck by the extraordinary daring of our guide, as to feel desirous of knowing something more of him; and a week or two after the occurrence here recorded, I rode over to his cabin, about five leagues from the city, built in a pleasant situation near a lake, under the shelter of palm and tamarind trees. Reining up my

horse at the half-open door, I announced my arrival in the customary phrase, 'Ave Maria purissima!' 'Sin pecado concibida,' answered a voice, which I recognised as Cayetano's. I alighted, and entered the cabin; the occupant was preparing his morning meal of wheaten cakes and small lumps of meat, cooked together on the embers of a wood fire burning in one corner. 'Ah! 'tis you, Senor Cavalier,' he said, without ceasing his occupation: 'welcome to my poor cabin. You find me busy with my breakfast; will you grant me the honour to do penance with me?' Declining to partake of the offered hospitality, I seated myself, while Cayetano ate his repast alone. The apartment was bare of furniture, but the walls were hung with nets, harpoons, and other utensils employed in pearl-diving and turtle-catching. Among these, however, a singular-looking garment attracted my attention: it was a kind of gaberdine, or rather a jacket with leathern suspenders, in which three enormous pockets were contrived at equal distances apart. Apologising to the owner for my curiosity, I inquired the use of the mysterious object. 'That?' said Cayetano; 'I'll tell you. Formerly we could put off to a ship with our silver ingots at any day or any hour: the custom-house officers even helped us, in spite of the laws prohibiting the exportation; but now the fellows are more severe, and we are obliged to do without them. For this I use my jacket. With an ingot in each pocket, and my cloak over my shoulders, I can get into my canoe in the teeth of the officers, without appearing inconvenienced by a weight which would bend a weaker man double. In this way ten trips suffice for the embarkation of 30,000 piastres, without my being obliged to share profits with any one. It is an increase of fortune for which I am indebted to Don Urbano's labours in congress.'

So the renowned Don Cayetano, to whom I had borne letters of recommendation, was no other than a smuggler or contrabandista! I was about to ask for an explanation of Don Urbano's congressional labours, when the trampling of horses' feet was heard outside, and a minute later two men entered. One, named Calzado, I had frequently met at the city; the other was a stranger. At the sight of the latter, Cayetano was seized with the same nervous tremor that I had noticed at the gaming-house; but immediately recovering himself, waited for the new-comers to open their business.

Calzado explained that a schooner, in which he wished to embark some silver, was at anchor off the island of Tiburon; and fearing that an information had been laid, he came to seek the contrabandista's assistance. The countenance of the latter brightened at the news; he took down his smuggling jacket and a harpoon from the wall, and went to saddle his horse. Calzado invited me to join the party, assuring me that I incurred no risk, and might be of great use to him. I had heard too much of smuggling exploits in this region not to close with the offer. We started immediately, the stranger leading a heavily-laden mule by the bridle. After riding some hours, we arrived on the cliffs overlooking the channel between Tiburon and the mainland. The cap of a mast was just visible over the tops of some trees on the island; and Cayetano, observing that no time was to be lost, with the assistance of the stranger, whom he addressed as Pepe, began to unload the mule. An ingot of silver, weighing about seventy pounds, was transferred to one of the pockets of his jacket; in the two others he placed a number of little skin bags containing gold-dust; and apparently at his ease under the heavy and precious burden, scrambled with Pepe down the steep face of the cliff to a hollow in the rocks, where a flat-bottomed canoe lay concealed. As they left the shore, I could not help admiring the dexterity with which Cayetano steered the frail vessel among the rocks and reefs which render the navigation of the channel, here about a league in width, a service of peculiar danger. Calzado was in a state of almost painful excitement. As we sat together on the top of the cliff, I inquired if he was not afraid to intrust property of so

much value to individuals of so desperate a character as the contrabandistas; to which he answered, that by one of the singular contradictions frequently observed in human nature, these men, ready to take human life on the slightest affront, would yet shrink from appropriating the property of others; 'besides,' he added, 'I know Cayetano, and the fanaticism with which he defends what he calls the honour of his name.' I expressed a desire to hear the story, which he related briefly as follows. About a year previously, the contrabandista had married a woman whom he passionately loved; but she proved faithless. The house in which they lived was not far from the Cerro, on the top of which a confederate was stationed to give notice of Cayetano's return from his expeditions, by striking on the stones, with whose singular properties you are acquainted. The confederate, after a time, proved false to his employers, and communicated the facts to the deceived husband; and a few nights afterwards the stones again rung, but with so dismal a sound, and accompanied by so fearful a yell, that all who heard it shuddered. A month later Cayetano returned home with the scar on his cheek as you now see it; but the lover of his wife was never seen again; and not long after, Cayetano's house was burned down, and his wife perished in the flames. The contrabandista was tried for the offence; but such is the way in which the law is administered in this country, that he escaped punishment; not, however, without a caution from the judge to avoid reappearing before him under similar circumstances.

'And what became of the confederate,' I asked, 'who caused all this tragedy?'

'He is at this moment in yonder canoe with Cayetano,' replied the Spaniard; 'and from the manner of the latter, I tremble for the result.'

All at once my companion whistled with such piercing shrillness, as to reach the ears of the two men in the canoe. Cayetano paused, and looked round; a boat, well manned, had just doubled the point towards which he was rowing. It was the custom-house boat; and as soon as the contrabandista ascertained its true character, he made a gesture of contempt with his harpoon, and darted off in another direction—one which could only be selected under the most desperate circumstances, as it led directly across the most dangerous part of the reef, where the water foamed and chafed among the sharp rocks as in a gale of wind. In the Spaniard's anxiety for the safety of his ingots, he fell back half senseless upon the grass; I snatched up his telescope, and watched the movements of the canoe through the glare of the setting sun. Cayetano held on his way, the light vessel bounding from wave to wave like a bird. All at once I saw Pepe rise pale and trembling, and then fall on his knees: at a menacing gesture from Cayetano, he sunk lower in the canoe, still raising his hands towards heaven. For a moment the scene was hidden by a sheet of foam, and I imagined that a shriek was heard above the roar of the waters. It passed, however, with the quickness of thought: the canoe rose perpendicularly on the face of a wave, and was dashed to pieces on the rocks: a dark body was hurled to the inside of the reef: I saw Cayetano throw out his arms, and then, the sun sinking below the horizon, the sudden night of the tropics hid the whole scene from my view.

The Spaniard's distress now gave way to rage, and he broke out into the most furious threats against the contrabandista. Notwithstanding the darkness, we remained sitting in the same place, when I fancied I heard a noise a little lower down the cliff, and a minute afterwards a head, dripping with water, appeared above the bank. It was Cayetano, still whistling the *Riego march* as when he set out. My companion drew his knife; but I succeeded in persuading him to listen to the other's explanation.

'Silence!' said the contrabandista: 'your gold is safe.' 'Where?'

'Ah, caramba! at the bottom of the sea. But don't

be uneasy; you have only to look on the other side of Point des Ames, where the water is quiet, and there you will find the mark. 'Twas Pepe's fault. Have I ever deceived you?'

Cayetano lit a cigar, and rode off gloomily, notwithstanding his assumed indifference. Just then a boat from the schooner appeared on the beach below us; we hastily embarked, and doubling the Point named by the smuggler, found, after some difficulty, a large piece of cork floating, which I remembered to have seen in his hands. It was attached to a line, which for some time resisted all efforts made to pull it in. At last, by the united strength of the boat's crew, a heavy mass rose to the surface: it was the dead body of Pepe, clothed with the jacket containing the ingots, and pierced through with the harpoon. In eager haste the Spaniard emptied the pockets of their contents, and the corpse was suffered to sink again to the bottom. The fatal treasure was safely placed on board the schooner, after which we returned to the shore.

Cayetano's vengeance was now complete. But all that I had seen and heard made a powerful impression on my mind. The scenery, which in the morning appeared so attractive, now seemed blackened by crime. I was glad to escape from it, and rode back to the city, regretting that so fine a country should be occupied by so lawless a population—offering so striking a contrast to those of the civilised states of Europe.

SIR GEORGE SIMPSON'S OVERLAND JOURNEY ROUND THE WORLD.

SECOND NOTICE.

THE week before last, we followed the trail of Sir George Simpson to the shores of California; and we now set forth in his wake for the Sandwich Islands, in the middle of the North Pacific.

'Whilst we were at dinner,' says Captain King, the friend and companion of Cook, 'in this miserable hut, on the banks of the river Awataka, the guests of a people with whose existence we had before been scarce acquainted, and at the extremity of the habitable globe, a solitary, half-worn pewter spoon, whose shape was familiar to us, attracted our attention; and on examination, we found it stamped on the back with the word *London*. I cannot pass over this circumstance in silence, out of gratitude for the many pleasant thoughts, the anxious hopes, and tender remembrances it excited in us.' 'This sixty years since!' and now the new adventurer, in putting a girdle round the earth, meets at the same island with native pilots, who speak English like their mother tongue, in front of a large and flourishing town of nine thousand inhabitants. Twenty years ago, Mr Stuart describes one of the queens as banqueting on a living cuttle-fish, held to her face with both hands, while its snaky arms writhed and twisted round her head. Sir George's supper with Governor Kekuanooa was somewhat different. 'We were received by the governor in his hall of justice, an apartment large enough for the church of a considerable parish, being sixty feet long, thirty broad, and about thirty-five or forty feet high, to the ridge pole of the roof. . . . The chiefs were all handsomely attired in the Windsor uniform, their clothes fitting to a hair's-breadth: so particular, indeed, are the aristocracy in this respect, that they have imported a tailor from England for their own exclusive benefit. Supper being announced, the chiefs, each taking one or two of our party by the arm, conducted us across an open area to another apartment of considerable size, built in the European fashion, and handsomely furnished with tables, buffets, chairs, sofas, &c.; the whole, or nearly the whole, being of native wood and native workmanship. The main table would have done no discredit to a London mansion, covered as it was with glass and plate, and lighted with elegant lamps. The fare was very tempting. It consisted of fruits of all kinds,

sweetmeats, pastry, Chinese preserves, &c. with excellent tea and coffee: the latter, which had been grown in Woahoo by the governor himself, being fully equal to Mocha. Our plates, by the by, had been marked with our names, and we had been told to take our seats accordingly, his excellency sitting at one side among his guests. In fact the whole proceedings blended the most punctilious regard to etiquette with the cordiality of natural politeness, beating, out and out and over again, all that we had seen in California, in every respect, in room, in furniture, in equipage, in viands, in cookery, and in dress. Nor were our native companions themselves so decidedly inferior as civilised vanity might fancy. The chiefs, especially our host, were men of excellent address; and as they spoke English enough to be understood, we soon forgot that we were sipping our coffee in a country which is deemed uncivilised, and among individuals who are classed with savages.

Some of the chiefs have houses built in the European fashion, of wood, stone, &c. occasionally of two storeys; with tinned roofs, balconies, verandas, and *jalousies*; and these are enclosed within small gardens of ornamental plants. The native houses, on the other hand, are so light, that it is common to remove them from place to place. They are made of a framework of bamboos, covered with grass; and having pointed roofs, and no opening but a single door, look like hayricks. 'The houses are commonly separated into sleeping and sitting compartments, by means of curtains hung across from wall to wall; but everything, whether exposed to view or not, whether within the house itself or merely within the surrounding enclosure, is scrupulously clean and neat, presenting in this respect a wonderful contrast with the filth and confusion of most of the native lodges of the continent. At whatever time of the day we dropped into a house, we found no difference in any of these particulars; there was never any unpleasant smell about the premises, all the refuse of fish, vegetables, &c. being regularly carried to a distance.' The furniture consists of straw mats laid upon the earthen floor, and piled upon each other when meant to serve as beds; together with a few gourds or calabashes for dishes.

The dress of the females is now according to the somewhat ascetic taste of the missionaries, consisting of a single garment, like a bathing wrapper; but, by way of a contrast, they retain a coiffure of flowers and leaves, which is described as elegant and becoming. On Sunday, however, they are caricatures of the English and American ladies of the place—flaunting in silks and satins, bonnets and parasols, and, above all, shoes and stockings; while a belle of this distinction is not unfrequently seen arm-in-arm with a gentleman whose entire walking costume consists of a *malo* twelve inches by three. This scantiness of apparel, however, is usually caused by scantiness of cash. When the treasury is replenished, these same gentlemen, 'so long as their cash lasts, lounge and saunter all day in the sunshine, habited in military surtouts, with frogs, &c. all complete, in white trousers, which fit them like their skins, in fashionable boots, in round hats, and in kid gloves of some gay or delicate colour, with their snowy wristbands turned back over their cuffs, the whole dandy being finished off with cane and eye-glasses. In process of time these bucks relapse, as a matter of course, through all the stages of worse-for-the-weariness, shabbiness, and dilapidation, down to the *malo*, with perhaps a garland on the head and a *kapa* on the shoulders.

'In form they are commonly handsome, strong, and well limbed; while in height they are in general something above the average standard of Europeans. On the whole, they are, as a race, considerably above mediocrity both in face and in person. The women in particular are decidedly pretty. They have a most lively expression of countenance, and are always smiling and attractive; and their figures may even be admitted to

be beautiful and feminine, seldom inclining when young either to corpulency or to the opposite extreme; limbs and busts well-formed, and hands, feet, and ankles small and delicate; while their gait and carriage, though somewhat peculiar, are yet, on the whole, noble and commanding.' This description, however, applies to the mass of the people, the aristocracy being remarkably tall and corpulent. With the latter, shampooing stands in place of exercise, promoting circulation and digestion without exhaustion or fatigue; and under such treatment they thrive so surprisingly, that they remain in perfect health, even when they have become so unwieldy as to be unable to walk. The people are gentle and harmless, obedient and submissive, faithful and courageous, and singularly industrious.

The Sandwich group contains 1000 square miles, or 640,000 acres of productive land, to which there is only a population of 88,000. This population is mainly supported upon *poi*, a preparation of the root of the *kalo*, of a brown colour, but otherwise resembling in appearance beet. 'It is reared in small enclosures, which, with great care and labour, are embanked all round, and constantly covered with six or eight inches of water; for, like rice, the *kalo* will not flourish in dry land.' And so productive is the plant, that a single square mile is said to be capable of feeding 15,151 persons; or, in other words, the whole population might be subsisted on six square miles; and this by the labour of one twenty-fifth part of their number. Supposing, however, that every person, without distinction of age or sex, required half an acre, 'there would still remain, even on that liberal and extravagant supposition, about 600,000 acres for objects not immediately connected with the maintenance of the natives.' The value of the land may be imagined from the fact, that an acre yields an average of a ton and a-half of sugar; so that the whole country is capable of producing several times the quantity consumed in the United Kingdom. But it is the position of the islands which has made, or will make, their fortune. 'For all practical purposes, the Sandwich Islanders are on the direct route from Cape Horn to all the coasts of the Northern Pacific. With respect to Kamschatka and the Sea of Ochotsk, this is evident at a glance; with respect to Japan, when its ports shall be opened, vessels will find their advantage, even without regard to refuge or refreshment, in deviating to the right of their straight course, in order to make the north-east trades above the equator as fair a wind as possible; and with respect to California, and the north-west coast, the apparently inconvenient deviation to the left is rendered not only expedient, but almost necessary, by the prevailing breezes which have just been mentioned. . . . But the group as naturally connects the east and the west, as the south and the north. Lying in the very latitude of San Blas and Macao, with an open sea in either direction, it crosses the shortest road from Mexico to China; while, considering its great distance to the westward of the new continent, but more particularly of its southern division, it may, without involving any inadequate sacrifice, be regarded as a stepping-stone from the whole of the American coast to the Celestial Empire. . . . The position of the Archipelago, as just described, is the more valuable on this account—that it neither is, nor ever can be, shared by any rival. If one makes no account of the comparative vicinity of mere islets, which are worthless alike for refuge and refreshment, the Sandwich Islands form perhaps the most secluded spot on earth, being at least twice as far from the nearest land as the lonely rock of St Helena. . . . Already have the Sandwich Islands begun to be a common centre of traffic for some of the countries which they serve to link together. . . . When the ports of Japan are opened, and the two oceans are connected by means of a navigable canal, so as to place the group in the direct route between Europe and the United States on the one hand, and the whole of Eastern Asia on the other, then will the trade in question expand in amount

and variety, till it has rendered Woahoo the emporium of at least the Pacific Ocean for the products, natural and artificial, of every corner of the globe. Then will Honolulu be one of the marts of the world, one of those exchanges to which nature herself grants in perpetuity a more than royal charter.'

It is melancholy to think, however, that this brilliant future is predicable only of the islands, not of the islanders. These are vanishing, as elsewhere, before the advance of civilisation. New luxuries have awakened new wants; and in order to satisfy these, the lower classes have been ground down by the chiefs to such a condition of starvation, that they have come to look upon their children as rivals and enemies. 'In 1824, Mr Stuart wrote thus:—"We have the clearest proof, that in those parts of the islands where the influence of the mission has not yet extended, two-thirds of the infants born perish by the hands of their own parents before attaining the first or second year of their age." Since then, the tyranny has been more in form of law, and regular taxes have taken the place of capricious exactions: but the effect remains the same. The diseases of Europe, and the depravity of the women, contribute likewise to thin the population; and the result is the extraordinary and pitiable spectacle of a nation rapidly vanishing from the face of the earth, 'because its ordinary wear and tear is not recruited from the ranks of a rising generation.' Our author's account of these interesting islands is the most intelligent and comprehensive we have yet received; although it certainly occupies a space singularly disproportioned to the general subject of the book, filling as it does more than a third of the second volume.

From the Sandwich Islands Sir George sailed for Sitka, the chief seat of the Russian-American Company, where he had a flying journey before him of *five months* through the dominions of the czar! Hitherto he has been in England. 'I have seen the English citizens of a young republic, which has already doubled its original territory, without any visible or conceivable obstacle in the way of its indefinite extension; I have seen the English colonists of a conquered province, while the descendants of the first possessors, however inferior in wealth and influence, have every reason to rejoice in the defeat of their fathers; I have seen the English posts, that stud the wilderness from the Canadian lakes to the Pacific Ocean; I have seen English adventurers, with that innate power which makes every individual, whether Briton or American, a real representative of his country, monopolising the trade, and influencing the destinies of Spanish California; and lastly, I have seen the English merchants and English missionaries of a barbarian Archipelago, which promises, under their care and guidance, to become the centre of the traffic of the east and the west, of the new world and the old.' Thus England and Russia, with the sole exception of the Swedish peninsula, girdle the globe together. But Sir George, we apprehend, miscalculates the grandeur of the latter country, by far the greater part of which is a desert.

Our traveller at length bade a final adieu to the American continent, and sailed for Ochotsk. During the voyage he learned 'that whales of huge size, some of them a hundred and twenty feet in length, are extremely numerous in the Sea of Kamschatka and about the Aleutian islands, and that they are frequently killed by the natives by means of spears and arrows shod with stone. As these whales are by far too large to be dragged to land by the savages, the plan is merely to wound the monster as seriously as possible, and then to trust to the winds to strand him in a few days. On or before the third day he generally dies, for however powerful to resist his persecutors at the moment of attack, the whale, when wounded, is by no means tenacious of life in proportion to his size and strength.' The pursuit of the otter is likewise a great resource of the natives. 'It is not uncommon for the Aleutians to make long voyages in their small baldarkas, often going fifty or sixty miles

from land to hunt the sea-otter. For this purpose they keep together in fleets of perhaps a hundred baldarkas each. Proceeding in calm weather to some spot known to be a favourite haunt of the animal, they form their little vessels, end to end, in a line; and as soon as any symptoms of the game are perceived, a single canoe approaches, while, if all is right, one of its two inmates holds up his paddle as a signal for the others to range themselves in a circle round the spot. Meanwhile, the creature must rise to breathe; and no sooner does he show his nose, than off fly the arrows of the nearest hunters. If he escapes, as is generally the case, from the first attack, another ring is formed round the place where he may be expected again to appear; and so the process is continued, till the victim is exhausted and destroyed. All these movements are executed with an incredible degree of silence, the hunters being so skilful as to prevent even the dip of the paddles from being heard by the object of their pursuit. These distant expeditions are not unattended with danger. The baldarka, being merely a frame of bones with a covering of skins, cannot withstand the action of the water for many days together; and if it springs a leak, or is otherwise injured, its tenants have nothing but certain and immediate death before them, for no other vessel can take more than its own complement on board; and calling their comrades around their sinking craft, they send kind messages to their wives and families, and then lie down to die without a single effort at self-preservation.' These hardy people meet the fate of other 'natives.' 'The Aleutian islands are now far less valuable than they once were. The human inhabitants hardly muster one to ten of their early numbers, having been thinned, and thinned, and thinned again—for here there is no mystery in the case—by hardships and oppression. They were ground down through the instrumentality of the natural wealth of their country; they experienced the same curse in their fur-seal and their sea-otter, as the Hawaiians in their sandal-wood, and the Indians of Spanish America in their mines of silver. To hunt was their task; to be drowned, or starved, or exhausted, was their reward. Even now, under better auspices and more humane management, the Aleutians are, in every respect, servants of the Russian-American Company, acting as labourers at the establishments, and as hunters throughout the whole country from Behring's Straits to California, while they almost entirely feed and clothe themselves without obtaining supplies.' Nor is Kamschatka better off. 'The favourite maxim of most of the public officers, great and small, in Siberia, is, that "God is high, and the emperor far off;" and of this watchword the Kamschatdales are sure, from their unfortunate place on the map, to enjoy the fullest benefit.' So far from making a profit by this oppression, the emperor loses; paying five thousand roubles a-year beyond the amount of the local revenue to the persons who take the trouble of plundering his subjects.

'The Sea of Ochotsk is completely land-locked, being in this respect, as well as in size and general situation, not unlike Hudson's Bay. The waters are shallow, not exceeding, about fifty miles from land, an equal number of fathoms; and rarely giving, even in the centre, above four times the depth just mentioned.' The population of the town of Ochotsk 'is about eight hundred souls, though, forty years ago, it amounted, according to Langsdorff's estimate, to about two thousand. The diminution is ascribed, and with great appearance of truth, to the circumstance, that the town has since then been supplanted as a penal colony by the mines—a change which the neighbourhood has had no reason to regret; for the convicts, always the worst of their class, were continually escaping, to prey on the public, like so many wild beasts. A more dreary scene can scarcely be conceived. Not a tree, and hardly even a green blade, is to be seen within miles of the town; and in the midst of the disorderly collection of huts is a stagnant marsh, which, unless when frozen, must be a

nursery of all sorts of malaria and pestilence. The climate is at least on a par with the soil. Summer consists of three months of damp and chilly weather, during great part of which the snow still covers the hills, and the ice chokes the harbour; and this is succeeded by nine months of dreary winter, in which the cold, unlike that of more inland spots, is as raw as it is intense.' Sir George saw little of the people of this dreary place. In summer, if the weather be fine, a dread of the noxious vapours of the marsh keeps them at home; and if the weather be not fine, then the rain and wind have the same effect. In winter, the cold of course is too severe for frequent exposure; although walking in snow-shoes a trifle of eighty or ninety miles a-day is esteemed a recreation by the gentlemen.

Leaving Ochotsk, they set forth in a caravan, under the guardianship of some of the Yakuti tribe, for Yakutsk. 'If there is anything in earth or air more formidable to these poor fellows than a Cossack, it is the "Spirit of the Forest"—a personage invested, in their imagination, with almost unlimited power, whether for good or for evil. In the branches of the trees along the road were suspended numberless offerings of horse-hair, the gift being probably selected as an emblem of what the giver valued most; the extemporaneous songs seemed to be dictated by the hope of conciliating the great unknown; and at supper, the first spoonful was invariably thrown into the fire, to purchase a sound sleep from the genius of the place. As every locality has its own elf, the Yakuti, when on a journey, have no respite—soothing one object of terror after another, and only multiplying their tormentors as they increase their speed.' On their way through this remote nook of Asia, they were constantly meeting with numerous travellers and rich caravans, although some such scene as the following occasionally reminded them that they were not exactly within the precincts of civilisation:—'While crossing a point of woods, we were surprised to hear loud shouts from some party a-head of us. Our Yakuti, however, returned the cries, while our horses, apparently as intelligent in the matter as their owners, grew very restive. To increase our perplexity, the fellows who had begun the commotion were now seen, still vociferating as loudly as ever, with a band of cattle scampering wildly before them; and our curiosity was soon tinged with fear, when we observed our attendants making ready their knives for some desperate work. We did not know what to make of all this, till at length we perceived a huge she bear and her cub making off, apparently as much frightened as any of us, at a round trot. We now ascertained that the bears are both fierce and numerous on this road; and as the natives have no firearms, they let Bruin get pretty much his own way, excepting that they do sometimes propitiate him, as if he were himself the "Spirit of the Forest," by all sorts of grimaces and obeisances. Two horses had been killed in the neighbourhood only the day before, very probably by the same animal that had caused the present alarm. Before the two brutes were out of sight, we passed the herd of cattle, the drivers riding the bulls with as much indifference as if they had been on horseback.'

The town of Yakutsk enjoys a temperature which keeps its cellars frozen all the year round, although for a short time in summer the thermometer stands at 106 degrees of Fahrenheit in the shade! It is, nevertheless, a great emporium both of the fur and ivory trade; the materials of the latter being the bones of an extinct animal preserved in the frozen soil of Eastern Siberia. 'Spring after spring, the alluvial banks of the lakes and rivers, crumbling under the thaw, gave up, as it were, their dead; and beyond the very verge of the inhabited world, the islands lying opposite to the mouth of the Yana, and, as there was reason for believing, even the bed of the ocean itself, literally teemed with these most mysterious memorials of antiquity. The ivory again fetches from forty to seventy roubles a pood, or from 1s. to 1s. 9d. a pound, according to its state of preser-

vation. The tusks are found to be fresher as one advances to the northward—a circumstance which seems to corroborate the notion that the climate has had something to do with their continued existence in an organic form. Though, in mere amount, this branch of commerce is of comparatively little value, yet it is well worthy of honourable mention, as having in a high degree promoted the progress of geographical discovery. It was in the eager pursuit of the bones of the mammoth that most of the northern islands were visited and explored—lands which, when taken in connection with their mysterious treasures, invest the Asiatic coast of the Arctic Ocean with an interest unknown to the corresponding shores of America.'

The voyage up the Lena was uneventful, unless a dance may be considered worthy of record. 'The music was the screeching of some half-dozen old women; and the floor was occupied by only one man and one woman at a time. First, the lady would endeavour to escape from her lover with an amusing display of coyness and coquetry; and then the gentleman, in his turn, would draw off, while his mistress would strive, by every winning way, to coax the truant back again. At the conclusion of each dance, the fair performer gave me three kisses, conferring the same favour on each of the other strangers, excepting that our Cossack appeared to me to get, or perhaps to take, a double dose. All the people, whether drunk or sober, carried their civility to excess, kissing my hand frequently, and even the ground on which I had been standing, and showering on me their perpetual benediction of "May you never want bread and salt!"' Farther on, the travellers suffered a little from hunger and cold; 'for we had started in the heat of the day, without shoes, and with no other clothes, in fact, than our shirts and trousers. The peasants, taking pity on our forlorn state, made a grand fire for us, and offered us a share of their own supper, which consisted of black bread, a little salt, and a dish of cold water, which, that it might look as like soup as possible, was taken with a spoon. Immense piles of the unsavoury cakes rapidly disappeared; and each person, as he finished his meal, bowed to some images that stood against the wall of the best room, of which the door was open.' It is worthy of remark that on the banks of the Lena nettles are cultivated as greens for the table.

Irkutsk, the metropolis of Eastern Siberia, 'presented a fine appearance, with its fifteen churches and their spires, its convents, its hospitals, and its other public buildings. But this favourable impression vanished as we approached; and we were disappointed at seeing so little bustle in the wide streets, and so many edifices going to decay.' From this place Sir George had looked forward to a trip to Kiachta and Maimatchin, the Chinese and Russian outposts, where the traffic between the two countries is carried on; but, for some reason not clearly explained, his design was frustrated.

Beyond Irkutsk, they found themselves in the midst of the convict population of Siberia, with whom the native peasants contrasted favourably. 'Not only are the peasants of Siberia remarkable for their civility, but all grades of society are decidedly more intelligent than the corresponding classes in any other part of the empire, and perhaps more so than in most parts of Europe. The system on which Siberia has been, and continues to be colonised, is admirable alike in theory and in practice. The perpetrators of heinous crimes are sent to the mines; those who have been banished for minor delinquencies are settled in villages or on farms; and political offenders, comprising soldiers, authors, and statesmen, are generally established by themselves in little knots, communicating to all around them a degree of refinement unknown in other half-civilised countries.'

'The villages are very numerous, not only on the road, but as far back on either side as we could see; and the people all looked healthy, comfortable, and happy. In any place where the post-house was out of

repair, our police officer used to pounce on the best house for our use; and as the owners would neither make any demand nor accept any remuneration, we were generally obliged to compromise the matter by forcing a small gift on the host's wife or daughter. The dwelling in which we breakfasted to-day was that of a person who had been sent to Siberia against his will. Finding that there was only one way of mending his condition, he worked hard, and behaved well. He had now a comfortably-furnished house and a well-cultivated farm, while a stout wife and plenty of servants bustled about the premises.' Sir George considers Siberia 'the best penitentiary in the world.' 'When not bad enough for the mines, each exile is provided with a lot of ground, a house, a horse, two cows, and agricultural implements, and also, for the first year, with provisions. For three years he pays no taxes whatever; and for the next ten, only half of the full amount. To bring fear as well as hope to operate in his favour, he clearly understands that his very first slip will send him from his home and his family, to toil, as an outcast, in the mines.' The mines and washeries, however, for which there is now a mania, are unfavourable to the settlement and cultivation of Siberia; although it is supposed they will ultimately support the agriculture they now embarrass, by affording a regular and extensive market for its produce.

The fine old city of Tobolsk, the ancient capital of Siberia, is admirably situated on two sides of the Irtysh; but its buildings present a melancholy spectacle of dilapidation and decay, and the population and trade are rapidly diminishing, in consequence of the general government of the province being transferred to Omok. From this place a single chapter brings the traveller to London, his journey round the world having been accomplished within the space of nineteen months and twenty-six days. We now close these interesting volumes, in the belief that the extracts we have made will induce all who have it in their power to refer to the book itself.

THE NIGHTINGALE.

MANY writers, the poets especially, have loved to dwell upon the subject of natural music—to trace it even in the inanimate creation—expatiating on it by the way with a reverent gladness that is quite contagious. But it is chiefly among the little feathered musicians, for which our island is so famous, that they have found their choicest examples of melody; and from the saucy chirrup of the sparrow, to the exquisite trill of the 'bird forlorn' taken as the subject of the present paper, the note of almost every bird that flies has been instanced as illustrative of endearment, joyousness, sorrow, or wo—in short, of all the manifold shades of feeling, according to the mood of the writer. Honest old Isaac Walton, with his keen relish of nature, says, 'But the nightingale, another of my airy creatures, breathes such sweet, loud music out of her little instrumental throat, that it might make mankind to think miracles are not ceased. He that at midnight, when the very labourer sleeps securely, should hear, as I have very often, the clear airs, the sweet descants, the natural rising and falling, the doubling and redoubling of her voice, might well be lifted above earth, and say, "Lord, what music hast thou provided for the saints in heaven, when thou affordest bad men such music on earth!"'

The nightingale belongs to the *genus* warbler: its general appearance, resembling that of the lark, is familiar to most persons. It is, however, somewhat larger than the latter bird, being nearly seven inches in length. All over northern Europe, its name is characteristic of the period at which it sings; but in the south, rather of its music and colour. Our present appellation is derived from the Saxon—*night*, and *gale*, to sing; or the night-singer. Nightingales are natives of warm climates. They are never found in Europe during the winter, but

in the summer are met with as far north as Siberia and Kamschatka. Their habits are peculiar, for, without any apparent cause, they frequent one country or district in great numbers, while in the parts immediately adjacent none are ever seen. They are abundant in Germany, and rare in Holland; and are altogether unknown, except by name, in Scotland, Ireland, and Wales. It is, however, worthy of remark, that the ancient Britons had a name for the nightingale. In England, the birds appear to confine themselves to particular places, being seldom heard farther north than Yorkshire; and in the west, avoiding the counties of Devon and Cornwall. The people in some parts of the country pretend to account for this peculiarity by saying, that where there are no cowslips there are no nightingales. They are also said to sing better in some counties than in others. Bird-fanciers in the metropolis prefer the birds taken in Surrey to those of Middlesex.

In common with the cuckoo, the nightingale begins to sing immediately after its arrival in April. We read in Warton—

'The nightingale, so soon as April bringeth
Unto her rested sense a perfect waking,
While late bare earth proud of new clothing springeth,
Sings out her woes.'

In June, the magic voice becomes hoarse and discordant, and in that month the birds cease their song. The males come first, and during the first fortnight are much sought after by trappers, as it is difficult to rear them with success after they have once paired. They generally choose a cheerful aspect for their nests, and, if possible, near water. They build on the lower branches of shrubs and bushes, sometimes on a tuft of grass, or on the ground, and lay five or six greenish-brown eggs. For a long time it was believed that the singing of the males was chiefly to divert the female during the period of incubation, which lasts about three weeks; but, according to modern naturalists, their song is the natural result of an intense love of harmony; and it appears to be certain that they possess an ardent spirit of emulation. 'Oh, nightingale!' writes Wordsworth—

'Oh, nightingale! thou surely art
A creature of a fiery heart:
These notes of thine, they pierce and pierce—
Tumultuous harmony and fierce.'

Whatever may be the vocal excellencies of other birds, they are all united in the nightingale; and philosophers have vied with poets in praise of the delicious music. Much, however, depends upon its being heard in the absence of the sun, when no other sound disturbs the solemn quietude that falls upon the country. Shakespeare, who makes Antony call Cleopatra 'his nightingale,' says—

'The nightingale, if she should sing by day,
When every goose is cackling, would be thought
No better a musician than the wren.'

Belon, an old French writer, observes in quaint language, 'Can there be a man so deprived of judgment, as not to take admiration in hearing such melody come out of the throat of such a little wild bird? And knowing so proud a voice, such resounding music issues from so small a tube, that human industry cannot approach it. But besides this, the better the nightingale is, the more pertinently doth he persevere in his song without weariness or giving up the enterprise: life, in sooth, would fail him sooner than voice.' Belon seems to have anticipated certain expressions in Crashaw's splendid poem, 'Music's Duel,' where the nightingale trails

'Through the sleek passage of her open throat,
A clear unwrinkled song: then doth she point it
By short diminutives,
That from so small a channel should be raised
The torrent of a voice, whose melody
Could melt into such sweet variety.'

Buffon, in his natural history of this bird, says in eloquent language, 'When this Coryphaeus of the spring prepares to sing the hymn of nature, he begins with a

timid prelude, and feeble, almost undecided tones, as though he wished to try his instrument, and interest the listener. But gaining confidence, he gradually becomes warm and animated, and displays in their fulness all the resources of his incomparable organ: brilliant throat-notes; light and lively trills; volleys of music, in which the precision equals the volubility; subdued interior murmurs, scarcely appreciable to the ear, but well adapted to set off the brilliance of the appreciable tones; sudden roudades; rapid and sparkling, articulated with the power and severity of perfect good taste; plaintive accents, cadenced with languor; sounds poured out without art, but filled with soul; sounds, enchanting and penetrating, genuine sighs of love and voluptuousness, which, issuing apparently from the heart, make every heart palpitate, and excite in all endowed with sensation the most soothing emotions and delicious languor.

In juxtaposition with the French philosopher's prose, we may place the verse of a Dutch poet, Loots, who says enthusiastically—

'Soul of living music! teach me,
Teach me, floating thus along;
Love-sick warbler! come, and reach me,
With the secrets of thy song.
How thy beak, so sweetly trembling,
On one note long-lingering tries—
Or a thousand tones assembling,
Pours the rush of harmonies.
Or—when rising shrill and shriller—
Other music dies away,
Other songs grow still and still—
Songster of the night and day;
Till—all sunk to silence round thee—
Not a whisper—not a word—
Not a leaf-fall to confound thee—
Breathless all—thou only heard:
Tell me—thou whoallest never,
Minstrel of the songs of spring!
Did the world see ages ever,
When thy voice forgot to sing?'

Attempts have frequently been made, but in vain, to note down the nightingale's melody. Bechstein fills nearly a page of his book with a number of incomprehensible-looking words, which he considers as conveying an idea of the sounds. One of our writers, however, comprises them in much smaller space, and pretends that the melody is contained in the following words: 'Sweet—sweet jug—jug sweet—sweet jug—pipe rattle—bell pipe—swat, swat, swat, swatty—water bubble—scroty—skeg, skeg, skeg—whitlow, whitlow, whitlow.' But the endeavour to reduce the 'complaining notes' to writing must always be futile. Yet there are instances on record of individuals who could produce so perfect an imitation by singing or whistling, that the birds themselves were deceived, and alighted on the mimic's shoulder.

Melancholy is supposed by the poets, probably on account of the associations of the hour at which the notes, wild and lively in themselves, are heard, to be the prevailing characteristic of the nightingale's song, and most writers dwell upon this imaginary sadness. Milton says—

'Sweet bird, that shunn'st the noise of folly,
Most musical, most melancholy;
Thee, chantress, oft the woods among
I woo, to hear thy evening song.'

The poet, who addresses one of his sonnets to the nightingale, seems, in fact, to have entertained a most eloquent love for the bird: he makes frequent mention of it in *Paradise Lost*; in their bower, Adam and Eve, 'lulled by nightingales, embracing slept;' and he tells us, in those touching lines on the loss of his sight, that he

—'feeds on thoughts, that voluntary move
Harmonious numbers; as the wakeful bird
Sings darkling, and in shades of covert hid,
Tunes her nocturnal note.'

In the latter lines we seem to have a reference to the solitary habits of the birds. They live much alone, arrive and depart singly, and, while pairing, seek the

most secluded places, into which they permit no intrusion; and on the occasions when they sing during the day, it is exceedingly difficult to detect the spot in which they are hidden.

The nightingale's voice may be heard over a circle of a mile in diameter, nearly the distance at which the human voice is audible. Possessed of such exquisite powers, they are much prized as cage-birds, but are not easily domesticated, owing to their delicate and sensitive nature. They are only to be reconciled to their imprisonment, by rendering their restraint as much as possible like liberty. They require to be treated with great tenderness; and if placed in an open cage, or in a northern aspect, they frequently worry themselves to death. But when accustomed to their captivity, they sing all the year through, except in the moulting season; and their music is then said, by a strange contradiction, to surpass that of their wild state. They may be taught to introduce variations into their song, and to take part in a chorus. In Aleppo, during the spring months, nightingales are hired by the evening to sing at concerts and other entertainments. It is, however, difficult to imagine that the singing can possess the same charm as when the birds are in perfect freedom, mingling their luscious notes with the leafy murmur of shady woods.

'How passing sad! Listen, it sings again!
Art thou a spirit, that, amongst the boughs,
The live-long day dost chant that wondrous strain,
Making wan Dian stoop her silver brows
Out of the clouds to hear thee? Who shall say,
Thou lone one, that thy melody is ray?
Let him come listen now to that one note,
That thou art pouring o'er and o'er again
Through the sweet echoes of thy mellow throat,
With such a sobbing sound of deep, deep pain!'

The nightingale was little likely to be left out of the glorious mythology of the Greeks. According to the fable, Progne, daughter of Pandion, king of Athens, who was married to Tereus, king of Thrace, had a great desire to see her sister Philomela. To spare his wife the fatigue of a voyage to Athens, Tereus offered to go and bring the maiden to his court. He, however, became enamoured of her, and at the end of their journey committed such an outrage, that in order to prevent the crime from becoming known, he slit the fair Athenian's tongue, and kept her in close confinement. But she, working with her needle upon canvas, contrived to send intelligence to Progne, and in revenge the sisters killed Tereus' son Itys, and cooked the child's flesh for the father's dinner. Discovering what was done, he drew his sword to kill the guilty pair, when the gods appeared, and doomed Tereus to take the form of a vulture; Progne became a swallow, and Philomela was changed to a nightingale, to lament incessantly over her wrongs. Such is the origin of the popular belief that the nightingale's tongue is split.

It is a little remarkable, as the male bird only sings, that authors generally speak of the nightingale in the feminine gender; a sacrifice of zoological accuracy to poetical expression. A passage in Chaucer's poem, 'The Flower and the Leaf,' is a striking exception to the mournfulness so universally considered as characteristic of this bird. The contest is going on in the forest, when

'The nightingale with so merry a note
Answered him, that all the wood rang
So sodainly, that as it were a sote
I stood astonied; so was I with the song
Thorow ravished, that till late and long,
I ne wist in what place I was, ne where;
And ayen me thought she song even by mine ere.'

Buffon relates an instance of a nightingale that lived seventeen years: it began to turn gray at the age of seven; at fifteen the quill-feathers of the wings and tail were entirely white, his legs were greatly increased in size, and the feet became gouty, and it was often necessary to clean and sharpen the upper half of his bill. There were no other appearances of age, for the bird, we are told, was always lively, always singing as in the

prime of his youth. So strong is the disposition of nightingales to migrate, that even when domesticated, they exhibit an extraordinary degree of restlessness at the migratory periods in spring and autumn. They are also said to manifest strong likings and dislikings, and to be so sensible of attachment, as to pine away and die on the death of any person with whom they have been familiar. Such is their horror of discordant sounds, that Belon, whom we have before quoted, says this feeling was taken advantage of to entrap them. A cat was fastened to a tree, and a string, tied tightly round some part of the animal, was carried to a distance along the ground; when the string was pulled, the cat squealed, and the nightingales flocking round in high indignation, were easily taken by bird-lime.

Many strange things have been recorded and spoken of the nightingale. From its singing all night, our forefathers considered its flesh to be a specific against drowsiness; and that if the heart and eyes were placed under the pillow of a person in bed, he would be unable to sleep; hence we find the nightingale adopted as the symbol of vigilance. Many curious lists of drugs and decoctions are to be met with in the works of old writers, the marvellous virtues of which would incite the birds to sing. Chaucer again tells us—

— 'Howe lovris had a tokning,
And among hem it was a commune tale,
That it were gode to here the nightingale
Moche rather than the lused cuckoo sing.'

Among other singular freaks, nightingales were said to rear only such of their young as displayed any musical talent. Most readers have heard of the famous dish of every talking and singing-bird known at the period, prepared at a cost of nearly £7000, for the tragedian Claudius Esopus, and of the feast of nightingales' tongues provided for Helioabalus. A white nightingale, valued at six thousand sesterces, was once presented by the Empress Agrippina to one of her friends. According to Pliny, some nightingales belonging to the two sons of the Emperor Claudius spoke Greek and Latin, and made new phrases every day to divert their masters; and Gesner gives an account of two others belonging to an innkeeper at Ratisbon, which conversed all night in German on the politics of Europe. He takes care, however, to qualify the story, by adding that the birds did no more than repeat at night the conversations they had heard during the day: even with this qualification, the tale remains sufficiently marvellous. Attempts have frequently been made to naturalise the nightingale in places to which it was a stranger. A gentleman near Swansea procured a supply of eggs from England, and distributed them among the nests of birds in that neighbourhood in the hatching season; but although the nightingales were contented to remain in their new locality during the first summer, they never returned to it in subsequent years. A similar experiment, which equally failed, was tried by Sir John Sinclair in Scotland.

In Moscow, the bird-fanciers keep large numbers of nightingales for sale; the average price is fifteen roubles. They are so abundant in Warsaw, that the streets are filled with their music. In some parts of Europe they are still fattened for the table; but the man who could relish a nightingale must have a strangely-perverted appetite. In Prussia, any person keeping one in a cage becomes liable to a tax.

The nightingale, although timid, is not suspicious, and is easily deceived by decoys, and captured. 'The nightingale-catcher,' says Mr Jesse, 'is generally a stealthy, downcast vagabond, most justly detested by all owners of groves, plantations, and hedgerows, possessing any good taste, within twenty miles of the metropolis. I knew one of these men who passed much of his time in the spring in the pretty lanes of Buckinghamshire, trapping the "merry nightingales" as they

like a veteran poacher; in which occupation, I was informed, he was very expert. . . . I have seen a nightingale, a few days after it was caught, take its food out of his lips; but he kept his method of taming a secret. . . . Poor fluttering bird,' continues the writer quoted, after recording a successful capture, 'your large dark eye is full of fear and misery, and your tender frame can ill sustain those desperate but ineffectual struggles for liberty. And what must be the sensations of the captive? for surely such a marvellous creation must have sensations and feelings somewhat more acute than those of the vulgar sparrow, or the pert chaffinch, and more akin to its nature and worth.'

HOUSEHOLD SURGERY.

In a recent number of the Journal, at the suggestion of a correspondent, we published, in more minute and practical detail than usual, the formula of treatment of the apparently drowned; and at a season of the year when so many plunge into the water for health, and so many more for pleasure, the memorandum may perhaps be found of some utility. But at all seasons of the year there are emergencies of various other kinds occurring, in which a little knowledge, and the coolness and presence of mind that accompany a consciousness of knowledge, may be of essential service; and we are well pleased to see that a surgeon of standing and character has now come forward to enlighten non-professionals as to what ought to be done, and the best way to do it, in the absence of the doctor.* Mr South sets out by advising us to get the doctor always when we can; but it is vain to preach upon this text. There are hundreds of accidents and complaints that have been the property of old women, and other amateurs, from all antiquity, and that never by any chance get into the hands of the regular practitioner till the others have coddled them up into something worth his while. It is of great importance, therefore, to bring this home-practice under the laws of science; and in sifting out from Mr South's collection, as we are about to do, the cases that most frequently occur, together with the treatment he recommends, so far from desiring to set up for a Goody Buchan on our own account, we design to call the attention of our readers to a useful and sensible book, which they will do well to make acquaintance with.

Let us first look into the home-doctor's shop. Poulitices were treated as matters of consequence by Abernethy, who described them as of two kinds—the evaporating or local tepid bath, and the greasy. Tepid bathing, by means of a poultice, he held to be the most soothing of all local applications, but effective only when the patient is kept in bed. To make it—'Scald out a basin, for you can never make a good poultice unless you have perfectly boiling water; then having put in some hot water, throw in coarsely-crumbled bread, and cover it with a plate. When the bread has soaked up as much water as it will imbibe, drain off the remaining water, and there will be left a light pulp. Spread it, a third of an inch thick, on folded linen, and apply it when of the temperature of a warm bath.' The drying of this poultice is not a defect, as our worthy grandmother supposes, but the very thing that is wanted—the proof of evaporation; and as this goes on, warm water must be dropped upon it, to keep up the action. Poppy, carrot, and horse-radish poultices are all bad: the juice only of these substances should be mixed, when wanted, with the bread poultice. 'The linseed-meal or greasy poultice is, on the same authority, to be made in the following manner:—Get some linseed powder, not the common stuff, full of grit and sand. Scald out a basin; pour in some perfectly boiling water; throw in the powder, stir it round with

* Answered and provoked each other's song."

He was a hard-featured, uneducated man, looking very

* Household Surgery, or Hints on Emergencies. By John F. South, one of the Surgeons to St Thomas's Hospital. London: Cox. 1847.

a stick, till well incorporated; add a little more water, and a little more meal; stir again, and when it is about two-thirds of the consistence you wish it to be, beat it up with the blade of a knife till all the lumps are removed. If properly made, it is so well worked together, that you might throw it up to the ceiling, and it would come down again without falling to pieces; it is, in fact, like a pancake. Then take it out, lay it on a piece of soft linen, spread it the fourth of an inch thick, and as wide as will cover the whole inflamed part; put a bit of hog's-lard in the centre of it, and when it begins to melt, draw the edge of the knife lightly over, and grease the surface of the poultice. The irritating poultice, to be used in cases where a blister is unnecessary or inconvenient, is made simply of mustard and water, mixed as if for the dinner-table, and put within the folds of a piece of fine muslin, so that only the watery part, oozing through, touches the skin. When this poultice is removed, the part should be sponged with warm water, and then gently dried with a soft kerchief. In the case of a child, it should be taken off in two or three minutes after the skin reddens. Cold poultices are disapproved.

Fomentations are warm fluids, applied for the purpose of encouraging perspiration on the skin, and thereby to diminish inflammation, and to render the skin yielding, so that the swelling which accompanies inflammation may be less painful, by the greater readiness with which the skin yields than when it is harsh and dry. The usual practice, therefore, of rubbing, dabbing, or pressing, is improper. The patient must be as well defended as possible from exposure to wet, by having something placed under him; and then a piece of thick flannel, or blanket, after being saturated in the warm fomentation, is to be instantly wrung, and laid liberally on the part of the body affected, and covered with oiled silk or a jack-towel, to keep in the warmth. This process is to be repeated every ten minutes or so, for hours if necessary. The foot or hand may be fomented by mere immersion, the heat of the fluid to be kept up by the addition, from time to time, of more which is hot. Warm water makes of course the readiest fomentation, and is generally the best.

The object of lotions (or washes) 'is to lessen the inflammatory condition of a part by diminishing its increased heat, which is one of the signs of inflammation; and they are of two kinds—cooling, and stimulating. The cooling lotion acts by means of evaporation, and should be applied by dipping a single piece of linen in the wash, and laying it upon the part, which of course is to be kept uncovered. As the evaporation goes on, the linen is to be kept moist with the lotion by means of a sponge. A spirit wash is made of half a gill of spirits of wine, or a whole gill of ardent spirits, to a pint of water; and a vinegar wash, by mixing one-fourth of vinegar with three-fourths of water. In case of severe pain, a tablespoonful of laudanum may be added to a pint of lotion. 'Stimulating washes are employed for encouraging sluggish sores to heal. They are usually applied by dipping lint in them, which, being then put on the sore, is confined with a roller.' The black wash is the most valuable of this kind, and is composed of a drachm of calomel in half a pint of lime-water.

Liniments are chiefly used to remove swellings, and are applied by rubbing *gently* with the flat of the hand for ten minutes or a quarter of an hour at a time. In the case of a large joint requiring the operation, the two hands are to be used, one at each side, and moved alternately up and down at the same time, making each hand travel half round the joint. One-third of hartshorn to two-thirds of oil make a good liniment for stiff neck and lumbago; another is an ounce of camphor rubbed down in four ounces of olive oil; and a third, called opodeldoc, is composed of three ounces of hard white soap and an ounce of camphor, put into a bottle with half a pint of spirits of wine, or other strong spirit, and as much water, and shaken from day to day till dissolved. But the best is the mustard liniment, made of 'an ounce of

fresh flour of mustard put into a bottle with a pint of spirits of turpentine, and shaken daily for two or three days.' After this, the liquid is fit to be decanted for use; and its advantage is, that it may be made to act slightly or severely, according to the length of time it is rubbed: to tickle, prickle, or smart the patient, or take off his skin, whichever he likes.

Ointments are of use merely to protect wounds from their coverings, from the air, and from filth, and the simpler they are the better. The common dressing for a blister 'consists of a quarter of an ounce of white wax, three-quarters of an ounce of spermaceti, and three ounces of olive oil, melted together.' Elder-flower ointment, for anointing the face and neck when sunburnt, 'is made of fresh elder-flowers stripped from the stalks, two pounds of which are simmered in an equal quantity of hog's-lard till they become crisp, after which the ointment, whilst fluid, is strained through a coarse sieve.' Plasters may be bought in the roll, and spread at home with a hot knife, when the parties are far from the druggist's shop.

We now come to the operations of household surgery, beginning with bleeding and blistering. The best mode of bleeding to be adopted by an unprofessional person is by cupping, which is easily learned, although we have no room for the directions. In the absence of a proper instrument, a common cup, or a tumbler (if of a belling shape, so much the better), may be turned down upon the part, after the air has been rarefied with lighted tow or paper. The skin rises into this, and is afterwards to be wounded with a lancet or sharp knife in half-a-dozen places. When leeches are inconveniently fastidious in their appetite, the skin may be scratched with a needle-point till the blood comes, which will generally be irresistible. A warm bread-and-water poultice, renewed every half hour, is better for encouraging the bleeding than sponging with warm water. Bleeding in the arm with a lancet is a delicate operation, owing to the neighbourhood of the great artery, and must be learned from a regular practitioner. It is, besides, in much less use than formerly after common accidents—such as a fall or a blow. The chief thing to be attended to in blistering is, that the plaster should never be suffered to remain on a child under ten years of age longer than till the skin has become well inflamed, which will be in three or four hours at most; and that if any of the disagreeable effects of blisters are feared, they may be easily avoided by covering the plaster before application with tissue paper.

The convulsion fits that so frequently carry off children are usually caused by the constitutional disturbance incidental to their cutting their teeth; and the 'remedy, or rather the safeguard, against these frightful consequences is trifling, safe, and almost certain, and consists merely in lancing the gum covering the tooth which is making its way through. Lancing the gum is very easily managed; and any intelligent person, after seeing it done once or twice, will do it very effectually. Cline taught a mother of a family to do this; and after lancing her children's gums she never lost another, at least from that cause; for, so soon as the teething symptoms appeared, she looked for the inflamed gum, lanced it, and they ceased. The operation is performed with a gum-bleam, the edge of which must be placed vertically on the top of the inflamed gum, and moved along, pressing firmly at the same time till the edge of the beam grate on the tooth, and the business is finished.

The best application for a bruise, be it large or small, is moist warmth; therefore a warm bread-and-water poultice, or hot moist flannels, should be put on, as they supple the skin, so that it yields to the pressure of the blood beneath, and thereby the pain is lessened. In the case of a serious bruise, a dozen leeches may likewise be necessary, but only for an adult, and they may require to be repeated two or three times. With regard to the bruise technically called 'a black eye,' warm bathing and patience are the only remedies. For

the benefit of those who may feel tempted to do what usually gives rise to this 'accident,' the doctor merely repeats the advice given elsewhere 'to persons about to marry'—Don't.

An ordinary cut or chop with a knife, chisel, axe, &c. even if it severs a finger or a toe, is only dangerous to the irritable or intemperate. 'The corresponding edges of the wound are to be brought together as perfectly as possible, and while thus held, some strips of plaster are to be laid across the wound, with small spaces between every two, so as to allow the escape of an oozing fluid, which often continues for some hours. The edges of the wound should not be dragged tightly together, but merely kept in place by the plaster; and if the wound be in the finger, arm, toe, or leg, it is better that the ends of the plaster should not overlap.' If common sticking-plaster be not at hand, court-plaster will do; or thin bands of tow may be wrapped round the part, and smeared with gum-water. Or if nothing else is at hand, a bit of linen rag, by absorbing the blood, constitutes itself a plaster as the moisture dries. The dressing is to be left on for several days, unless the wound grow painful and throb; in which case it is to be taken off by the aid of warm water or a soft poultice. If the discharge is inodorous, straw-coloured, and creamy-looking, you may apply the plaster again; if otherwise, the wound must be poulticed till these wholesome signs appear. A bruised cut must be poulticed with bread and water to moderate the inflammation, and then with linseed meal, till new flesh grows instead of that which has been *killed* by the blow. The latter comes away in appearance like a piece of wetted buff-leather. Scratches are often *fatal*, in consequence of soap, pearl-ash, or filth of any kind getting into them, and should therefore be kept covered. Pricks with a thorn, &c. are likewise dangerous, occasionally producing locked jaw. Poulticing, leeching, &c. must be had recourse to if serious appearances occur; with a smart dose of calomel inwardly, and some hours after, castor oil.

When blood is coughed up, it is known to come from the lungs by its frothiness, if in small quantities, and its pure bright redness when more plentiful; and when vomited from the stomach, by its dark colour. In either case, all that non-professionals can do is to cup or bleed, and keep the patient cool in bed. When the discharge is from the lungs, the fainter he is the less danger. Bleeding from wounds is stopped by pressure on the part; or, if necessary, the ends of any little artery that may be severed, are to be tied with a thread; or when the bleeding is important and continued, the main artery that supplies the limb may be stopped till medical assistance is obtained: in the case of the arm, by pressing the thumb behind the middle of the collar-bone; and in the case of the leg, below the crease of the groin. When the bleeding is below the middle of the upper arm, or thigh, a stick tourniquet will answer the purpose. It is merely a handkerchief passed two or three times round the limb above the wound, and twisted as tightly as may be necessary by means of a stick.

Scalds and burns are frequently dangerous; and in them 'remember, that as it is always hoped the scald or burn is confined to inflaming or blistering the skin, it is of the utmost importance not to burst the blister by tearing the skin, nor to let out the water it contains by pricking it.' The clothes, if any, over the part must be cut away, but only so far as they will come easily. The patient, if severely injured, must be kept warm; and if he continues to shudder or shiver, a little hot wine and water, or spirits and water, should be administered. 'The object in treating scalds and burns is to keep up, for a time, the great heat or high temperature to which the injured part has been raised by the scalding or burning, and to lower this by degrees to the natural heat of the body. The best and readiest dry materials to be applied are flour, or cotton, or cotton-wadding; the wet are—spirits of turpentine, spirits of

wine or good brandy, lime-water and oil, lime-water and milk, milk alone, or bread-and-milk poultice; and all these wet applications must be made of sufficient warmth to feel comfortable to the finger, but not hot.' When the blisters become uneasy, after the lapse of perhaps from thirty to fifty hours (for the pain moderates in a few hours after the accident, unless it has been very severe), they must be carefully cut and dressed. The treatment of the opposite accident, frost-bite, is analogous. 'In restoring a frozen person, or a frost-bitten part, the object is directly the reverse—that is, to keep the cold, which by its exposure the body has acquired, and to withdraw it by slow degrees till the body has recovered its natural heat. If the person or part be brought suddenly into a hot room, or put in a warm bath, he or it will be killed outright. "The frozen person," says Chelius, "should be brought into a cold room, and after having been undressed, covered up with snow, or with cloths dipped in ice-cold water, or he may be laid in cold water so deeply, that his mouth and nose only are free. When the body is somewhat thawed, there is commonly a sort of icy-crust formed around it; the patient must then be removed, and the body washed with cold water mixed with a little wine or brandy: when the limbs lose their stiffness, and the frozen person shows signs of life, he should be carefully dried, and put into a cold bed in a cold room: scents, and remedies which excite sneezing, are to be put to his nose; air is to be carefully blown into the lungs, if natural breathing do not come on; clysters of warm water with camphorated vinegar thrown up; the throat tickled with a feather; and cold water dashed upon the pit of the stomach. He must be brought, by degrees, into rather warmer air, and mild perspirants, as elder and balm tea (or weak common tea), with Minderer's spirit, warm wine, and the like, may be given to promote gentle perspiration.'" Frost-bitten parts should be bathed or rubbed with cold water or snow.

For sprains, warm moist flannels applied to the part, and a bread-and-water poultice on going to bed, are recommended; but this, in our humble and unprofessional opinion, is only adapted to cases in which the patient thinks proper to look forward to weeks of such coddling. We have before now cured ourselves in a few hours of a severe sprain of the ankle-joint, attended with swelling, by fomentations of water as hot as we could bear them.

'Broken limbs should not be set, as it is called—that is, bound up with roller, splints, and pads—for the first three or four days, as for some hours after the accident the part continues swelling, and if bandaged up tightly whilst this is going on, much unnecessary pain is produced; and if the bandages be not slackened, mortification may follow, which I have known to occur. It is best then, at first, only to lay the broken bone in as comfortable a posture as possible, and nearly as can be in its natural direction; and it may be lightly bound to a single splint, merely for the purpose of keeping it steady. The arm, whether broken above or below the elbow, will lie most comfortably half-bent upon a pillow. The thigh or leg will rest most easily upon the outer side, with the knee bent.' In the case of broken ribs, a flannel or linen roller, about six yards long and two hands'-breadth wide, must be bound tightly round the chest. Bleeding should not be had recourse to, unless the patient complains of pain, or is troubled with cough. 'The bowels should be cleared with a purge, and twenty drops of antimonial wine, with a teaspoonful of syrup of poppies in a glass of water, given three or four times a-day. After a few days, the person will find himself much more comfortable sitting up than lying in bed.' But the special treatment differs so much as regards the different parts broken, that we can only refer generally to Mr South's book.

A dislocation is reduced by the limb being returned to its place from which it has slipped out; and the chief difficulty lies in the instinctive or involuntary resistance made by the patient. A great part, therefore,

of the operator's dexterity consists in his putting the sufferer off his guard at the critical moment.

Having already described the treatment in a case of stifling by drowning, we shall now only say on this subject, that when the catastrophe occurs by hanging, there is little or no hope after a few minutes' suspension. 'The body should be stripped, dashed with cold water, blood should be taken from the arm, and stimulating liniments rubbed perseveringly on the chest.'

Choking, by attempting to swallow too large a piece of food, 'may usually be overcome by taking large draughts of water, and making great efforts to swallow. Sometimes, if a bone or pin be near the top of the throat, it may be got out by pushing the finger far down, and hooking it up with the nail. But if below the reach of the finger, the best thing to try for immediate relief is to take some crust of bread, or some hard apple into the mouth, chew it coarsely, get down two or three mouthfuls without swallowing it completely, and then to swallow quickly three or four gulps of water, which acts like a rammer to the bread, and forcing it against the bone or pin, not unfrequently carries it down into the stomach, and there the matter ends.' The buttons and other small matters a child sometimes swallows are rarely attended by any troublesome consequences, although the source of so much alarm to parents.

We have now run through this most useful volume; but although the passing hints we have collected from it will be advantageous of themselves to many of our readers, we are in hopes that they will only stimulate another class to possess themselves of the work.

DWELLINGS FOR THE WORKING-CLASSES.

THE attention which is now being paid by the richer classes to the physical wants, the social and domestic comforts, and consequently the moral and intellectual advancement of the humbler and labouring portion of society, is one of the distinctive and most pleasing characteristics of the present day. The efforts making, in and out of parliament, by public bodies and private individuals for the sanitary improvement of towns—the working population in which, in their crowded and ill-ventilated dwellings, are influenced now by domestic annoyances, noxious odours, and demoralising circumstances, the evil tendencies of which cannot be over-estimated—are a very gratifying practical result of the spirit which now prevails. In Liverpool, much is *doing*, or is *about* to be done, in the right direction; but if we cross the Mersey, and take a walk through Birkenhead, we find that much *has been done*. The public parks, the wide streets, the attention to drainage and sewerage, all bespeak an attention and foresight much to be commended; but the cottages erected by the Birkenhead Dock Company for the residences of the workmen, will long remain as monuments of the commencement of a new era, which, we trust, will bring with it health, happiness, comfort, ay, and comparative wealth, to the industrious people of this country. These cottages are built near the foot of Bidston hill, overlooking Wallasey marsh, and adjoining the upper end of the great dock at Birkenhead. At a distance, they have a strong and very imposing appearance. The buildings are erected on the plan of the houses in Scotland, each tenant occupying a 'flat'; and as they are four storeys in height, eight families are accommodated in each house. Of course there is a common staircase for the use of the eight families; but the stairs once ascended, each residence is quite distinct. Most of the cottages consist of three apartments—a kitchen and two bedrooms. The kitchen is fitted up with a grate, oven, &c. There is also a small scullery, containing sink-stone, water-pipe, with the water constantly on, bunker for coals, shelves, &c. Adjoining is a water-closet, through which, to prevent offensive effluvia, all water from the pipe and sink-stone passes; and there is a dust-hole in each scullery, into which sweepings, cinders, and all rubbish may

be brushed, the occupants having no further trouble with them. The bedrooms are supplied with iron bedsteads and wash-stands. Each room has a ventilator at the bottom and top; and the windows are so constructed, that they can be easily opened for the further admission of air. There is also a cupboard in every cottage, and all the apartments are neatly papered, painted, and fitted up with shelving, iron hooks for clothes, &c. The building is fire-proof, there being no possibility of the fire in one flat extending. In fact, beyond consuming the furniture in the flat, little damage could be done to the building by any fire which broke out. The roof of each house is flat, and covered with asphalt. It is also surrounded by a parapet wall several feet high, and will form an excellent playground for children, who will thus be placed beyond the danger of accidents from horses and carts. It may also be used for the drying of clothes; and the workmen, at the close of their day's labour, may, in the summer time at least, pleasantly spend an hour or two in smoking their pipes, in reading, or in enjoying the extensive prospect before them. The rent of a cottage on the top storey is 3s. 9d. a-week; on the third storey, 4s.; on the second, 4s. 3d.; and on the first, 4s. 6d. There are cottages with two apartments, the lowest rent of which class is 3s. 6d.; and others of four rooms, which of course are a little dearer. In all, there are about three hundred cottages already built. Between each pile of building there is a space of eighteen feet. When it is taken into consideration that there are no back premises from which any nuisance can arise, this may be considered a wide space; yet still, if there be any fault at all, this may be considered as one. If it were a rule that the space between each pile should not be less than the height of the buildings, it would be much better. As an improvement, however, upon the cellar and cottage residences of the crowded districts of this town, they are admirable.—*Liverpool Mercury*.

[We lately visited the Birkenhead Cottages, as they are called, and can testify that this is a correct description of them. Only one important circumstance is omitted—that the buildings are at such a distance from the mass of the town (upwards of a mile), that they are not as yet convenient houses for working-men connected with Birkenhead, and accordingly few of them are occupied. A gardener employed at his labour near the wayside stated the case to us briefly and justly, when he said, 'A working-man must live near his work.' As a necessary consequence of the paucity of inhabitants, no shops are yet opened at the place; and thus the few people who do live in the cottages are exposed to some inconvenience in obtaining the necessities of life. Owing to these circumstances, we fear that the cottages are for the present a failure. They can serve the contemplated end only when the town and its works come out to this place; and even after all, the men engaged at the works which now exist will remain unbenefited.]

The plan of the houses is, however, excellent. Perhaps no other can rightly be adopted for the dwellings of working-men in large towns, this being the only one which admits of a multitude being healthily placed on a comparatively small space. It is simply the *floor plan*, so prevalent in Paris and Edinburgh, and exemplified in the Temple Chambers and Inns of Court in London. It has its inconveniences, but is also attended by some advantages even for the middle classes; above all, *one*—that of requiring no ascent of stairs to pass from one apartment to another. Once in the house, you move about it with an ease and facility unknown to the occupants of those *houses upon edge* which constitute the bulk of the most modern streets and squares in London. For females, who seldom go abroad above once a-day, but who have occasion to pass from room to room every now and then, the convenience of the floor system is unspeakably great; and we should wonder that it had not been adopted long ago in London, did we not know how long it is before new habits are learned, or old pre-

judices overcome. For architectural effect, we may add, the floor system is infinitely preferable to that of narrow independent houses. It also abolishes, to shopkeepers, the monstrous inconvenience of having to take a house along with the place of business, whether it be needed or not.*

Whatever, then, be the success of the Birkenhead experiment, its utility as a model, and as showing what goodly dwellings can be furnished to the working-classes at a moderate charge, is very great. We hope, however, to see houses of this kind for the most part built in the very places heretofore occupied by unhealthy tenements. There a double good would be accomplished. Before such structures can be seen rising in many places, good harvests must have done their proper work in facilitating human labour. We may add, that before working-men can hope to attain houses at a ratio of rent not exceeding that of the middle classes, it will be necessary that some plan be adopted for securing the landlord in his returns. We have always been aware that insecurity in this respect was a means of greatly increasing rents to the working-classes; but we never knew till lately how high, in some instances, this increase is carried. A gentleman who takes charge of the incomes of a number of persons in humble life, lately adopted the plan of leasing for them a group of houses, insuring the payment of the rent. They were obtained at *thirty per cent.* below the usual rates. The extent to which honest and careful men thus suffer for the negligent and unworthy, is surely much to be deplored. Perhaps the evil might be in a great measure overcome, and a needful encouragement at the same time given to speculators, by a plan of mutual guarantee amongst operative tenants for the faithful payment of rents.]

COURTING IN FRENCH HOLLOW.

It is a pity that American fun, like Irish fun, has a patois of its own, which it is not a little difficult to understand. The patois, indeed, was originally part and parcel of the joke; but the best joke in the world will not bear a hundred times telling. In a book before us, just published in Philadelphia, called 'Streaks of Squatter Life,' there is a good deal of cleverness, and some genuine humour; but it is spoiled for the European palate by an impracticable dialect. Perhaps the following is the most readable article (with the exception of 'the Pre-emption Right,' an excellent tale, chiefly in good English, which is too long for our pages), and we give it to show how Jonathan 'progresses' in a kind of writing peculiar to American literature:—

'Courtin' is all slick enough when everybody's agreed, and the gal aint got no mischief in her; but when an

extensive family, old maids, cross daddy, and a romantic old mommy, all want to put thur fingers into the young uns dish of sweet doin's, and the gal's fractions besides, why, a fellar that's yearnin' arter matrimony is mity likely to git his fires dampened, or bust his biler.'

Thus reasoned Tom Bent to a select party of river cronies, who were seated around him upon the boiler deck of a Mississippi steamer, as she sped along one bright night in June, somewhere in the neighbourhood of Bayou Teche. The subject was courting, and on that particular question Tom was considered an oracle; for, besides having a strong penchant for the fair sex, he had run many risks to ingratiate himself in their affections. Tom was now fast falling into the sear and yellow leaf of bachelorism, and although he had vowed unalterable affection to at least one fair one in each town between the mouth and the rapids, he still remained in unblest singleness.

'How about that affar of your'n with old Fecho's gal in St Louis, Tom?' inquired one of the circle.

'What, that little French gal?' inquired Tom, with a grin. 'Well, that thar was a salty scrape, boys; and though the laugh is agin me thar, I'm blessed if I don't gin you the sarcumstines.' So Tom squared himself for a yarn, wet his lips with a little corn juice, took a small strip of Missouri weed, and 'let out.'

'That gal of old Fecho's wur about the poostiest creatur, fur a foreigner, I ever took a *shute* arter; her eyes jest floated about in her head like a star's shadow on a Mississippi wave, and her model was as trim as the steamer Eagle; 'sides, her paddles wur the cleanest-shaped fixin's that ever propelled anythin' human, and her laugh rung like a challenge-bell on a "fast trip"—it couldn't be beat. She run into my affecahuns, and I couldn't help it. I danced with her at some on the balls in Frenchtown, and thar I gin to edge up and talk tender at her, but she only laughed at my sweet'nin'. Arter a spell, when I cum it strong about affecshun, and the needcessity of towin' side and side together, she told me that her old daddy wouldn't let her marry an American! Ef I warn't snagged at this, I wouldn't say so. The old fellar wur a sittin' on a bench smokin' and lookin' on at the dance, and I jest wished him a hot berth for a short spell. "Well, Marie," said I, "ef I melt the old man down, will you gin in?"

"Oh," says she, "you so vair strong at de vat you call *coax*, I shall not know how to say von leetel no."

'So havin' fixed it all with her smooth as a full freight and a June rise, I drew up alongside of the old fellar, jest as he had cleared his chimley for a fresh draw of his pipe. Old Fecho had been a mountain trader, was strong timbered, not much the worse fur wear, and looked wicked as a tree'd bear. I fired up, and generated an inch or two more steam, and then blew off at him. "That's an unconscionable slick gal of your'n, mounseer," says I, to begin with; and it *did* tickle his fancy to have her cracked up, 'cause he thought her creation's finishin' touch—so did I!

"Oui, sair," says old Fecho, "she vair fine leetel gal, von angel wizout de ving; she is, sair, mine only von fille."

"Well, she is a *scronger*," answered I; "a perfect high pressure, and no dispute!"

"Vat you mean by him, eh? vat you call s-c-r-r-r-ouge, eh? vat is he, sair? My leetel gal no vat you call von s-c-r-r-r-ouge, sair!" and here old Fecho went off into a mad fit, jest as ef I'd called her bad names. I tried to put down his "safety-valve," but he would blow off his wrath, and workin' himself into a perfect freshet of rage, he swore he would take the little gal off home; and I'm blessed ef he didn't. As soon as I eyed the old fellar startin', I got in his wake, and follered him, determined to find out whar he located; and arter an eternal long windin' through one street arter another, down he dived into French Hollow. Jest as he wur about to enter a house built agin the side of the hill, the old fellar heered my footsteps, and turnin' round in the darkness, he shouted—"Ah ha! von sneak Yankee

* A 'Suburban' correspondent of 'The Builder' proposes the introduction to the metropolis of the system which has been found to work so well in, and, in fact, in great measure to constitute, the northern 'City of Palaces,' Edinburgh. In London, as observed, persons not prepared to give more than L30 a year have no choice between the most paltry 'lath-and-plaster' cottages—so raw, damp, and undrained, and full of green wood, as to be little better than a domicile 'under the greenwood tree' itself—or unfurnished lodgings in houses not built for the purpose of accommodating separate families, and where the intermixing of the landlord and his lodgers is most unpleasant. In fact, in the metropolis itself, the great body of the middle classes are actually without appropriate or class dwellings altogether, for the green-wood cottages are suburban more than urban residences. The projector, however, in the meantime recommends that a handsome building, like those in the Temple, but with more domestic conveniences, should be erected in a convenient suburb, and let out in chambers; and the first experiment might be made in the following manner:—Let a builder of capital procure plans and elevation from a competent architect; and having found a suitable piece of land, announce that, as soon as he had the names of a sufficient number of parties willing to rent (say thirty sets of chambers), he would commence the first block. The subscription of parties, willing to engage for a year certain, would be filled up in a week. The Bank of England clerks would alone supply a score of tenants, and all the government offices a tithe of poor proud couples. Eventually, perhaps, the economy of a public kitchen and joint-stock cook might be arranged by some of the tenants on the club system.

doodel, vat call my leetel gall von s-c-r-r-ouger; I shall cut you all up into von leetel piece vidout von whole."

"You know, boys, I aint easy skeer'd, but I own up that old fellar did kind a make me skeery; they told sich stories about the way he used to skin Ingins, that I gin to think it was about beat to let him have both sides of the channel ef he wanted it, so I didn't darr go to see Marie fur a long spell. One day I felt a strong hankerin', and jest strolled along the holler to git a glimpse on her; and sure enough thar she wur, a-leanin' out the winder, smilin' like the mornin' sun on a sleepin' bayou. I sidled up to the house, and asked her ef I darr cum and sit up with her that evenin'. I told her I was jest fritterin' away all to nothin' thinkin' on her, and a small mite of courtin' would spur me up amazin'; and then I gin her sich a look, that she fluttered into consent as easy as a mockin'-bird whistles.

"Oh, oui, you shall come some time dis night, when *mon pere* is gone to de *cabaret*; but you must be vair quiet as von leetel rat, vat dey call de mouse, and go vay before he come back to de *maison*."

"In course I promised to do jest as she said. I kissed my hand to her, and said *au revoir*, as the French say for good-by, and then paddled off to wait for night. I felt wuss than oneasy until the time arriv, and when it did git round, I gin to crawl all over. I swar I was a little skeered. Hows'ever, it warn't manly to back out now when the gal was expectin' me, so I started for the Hollow. I think a darker night was never mixed up and spread over this yearth. You remember, Bill, the night you steered the old Eagle square into the bank at Milliken's bend? well, it wur jest a mite darker than that! A muddy run winds along through the ravine whar the house stands, and I wur particularly near floppin' into it several times. A piece of candle in the winder lighted me to whar the little gal was awaitin', and when I tapped at the door below, she pattered down and piloted me up to the sittin'-room, whar we sot down and took a good look at each other. She looked pooty enough to tempt a fellar to bite a piece out on her. I had all sorts of good things made up to say when a chance offered, and here the chance wur, but cuss me ef I could get out the fust mutter. Whether it wur skeer at the idee of the old Frenchman, or a bilin' up of affecshun fur his darter that stuck my throat so tight, I'm unable to swar, but thar I wur, like a boat fast on a sand-bar, blowin' some, but makin' mity little head-way.

"Vat is de mattair wiz you, mounseer?" said Marie; "you look vair much like de leaf in von grand storm, all ovair wiz de shake!"

"Well," says I, "I do feel as ef I wur about to collapse a flue, or bust my biler, for the fact of the matter is, Marie, they say your old daddy's a tiger, and ef I get caught here, thar'll be suthin' broke—a buryin' instead of a weddin'; not that I'm the least mite skeered fur myself, but the old man might git hurt, and I should be fretted to do any sich a thing."

"Oh, *mon amie*, nevair be fear fur him; he is von great, strong as vat you call de gentleman cow—von bull. But, *mon Dieu*! what shall I do wiz you, suppose he come, eh? He vill cut you into bits all ovair!"

"But, my angel," ses I, "he sha'n't ketch me, fur I'll streak it like a fast boat the moment I hear steam from

his scape-pipe: the old man might as well try to catch a *Massissippi caty* with a thread-line, as get his fingers on me." I had no sooner said so, than bang went the door below, and old Fecho, juicy as a melon, came feelin' his way up stairs, mutterin' like a small piece of fat thunder, and swarin' in French orfully. I know'd thar warn't much time to spare, so I histed the winder, and backed out. Jest as I was about to drop, Marie says to me—"Oh, *mon Dieu*! don't drop into de well!" and instantan shut the winder. My *har riz* on cend in a moment—"don't drop into the well!" I'll tell you what, boys, a souse into the *Massissippi* in ice time warn't half as cold as her last warnin' made me. It was so eternal dark, that I couldn't begin to tell which side of the buildin' I wur on, and that wur an all-important perticular, fur it wur jest three storeys high on one side, towards the Hollow, and it warn't only one on the side next the hill—in course, all the chances wur in favour of the *well* bein' on the low side. I'd gin all I had then to know which side was waitin' below fur me. I looked up, as I hung on, to see ef thar warn't a star shinin' somewhere, jest to give a hint of what was below; but they'd all put on thar nightcaps, and wouldn't be coaxed from under the kiver; then I'd look below, and listen, until I made sartin in my mind that I could hear the droppin' of water, somewhere about *fifty feet* below me! Old Fecho was a-tearin' through the room, and a-rippin' out French oaths, in an uncommon rapid manner, and declarin' that he knew some one had bin thar, fur he'd been told so. Two or three times he appeared to be a-rushin' for the winder, and the little gal would coax him back agin; and then he'd cuss de Yankee doodles, and grit his teeth most owdaciously. Well, ef I warn't in an oneasy situation all this time, then I'm more than human—my arms jest stretched out to about a yard and a-half in length, and gin to cramp and git orful weak. I couldn't, fur the life of me, think on any prayer I'd ever heerd: at last, jest as one hand was givin' way its hold, I thort of a short one I used to say when I was a younker, and mutterin'—"Here I drop me down deep, I pray the Lord my bones to keep!" I sot my teeth together, drew a long breath, shut my eyes, and let go!—Whiz!—r-r-r-ip!—bang! I went, as I supposed, about *fifty feet*; and didn't I holler, when I lit and rolled over, and the water soused all round me! "Murder! Oh, get me out! Oh-o-o-o, murder!" The people came a-rushin' out of their houses with lights, and sich another jargon of questions as they showered at me—askin', altogether, who'd bin a-stabbin' me? what wur the marter? and who'd hit me? I opened my eyes to tell 'em I'd fell from the third storey, and broke every bone in my body, when, on lookin' up, thar wur the old Frenchman and his darter grinnin' out of the top winder about *ten feet* above me! The fact wur, boys, I'd dropped out on the hill-side of the house, and jumped down jest *four feet* from whar my toes reached—I had lit on the edge of a water-pail, and it flowed about me when I fell over! Arter old Fecho told them the joke, they pretty nigh busted a-larfin' at me. I crawled off, arter firin' a volley at old mounseer of the hardest kind of cusses; and from that day to this I han't gone a-courtin' in French Hollow!

The present number of the Journal completes the seventh volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 183. NEW SERIES.

SATURDAY, JULY 3, 1847.

PRICE 1½d.

'A THING OF BEAUTY IS A JOY FOR EVER.'

WHAT is the use of Beauty? Is it intended merely to amuse the fancy for a time, and then pall, fade, and be forgotten? In a system where nothing else is lost, where all is fitness and coherence, and where each part, however minute, seems as necessary to the whole as a single link is to the continuity of a chain, is this quality alone without definite meaning or permanent purpose? Analogy is against the supposition; and we must either set down beauty as an unmeaning superfluity in the scheme of creation, or else assign it an importance commensurate with the space it occupies in our thoughts.

The impressions we receive from external objects are sufficiently well understood in their momentary effects. It is customary, for instance, to say that the beauty of some still and solitary landscape, coming in amidst the conflict of the passions, tranquillises the unquiet bosom, and smooths the wrinkled brow. But if this is correct in the particular application, may we not deduce from it, as a result, that a habitual exposure to similar influences will have a permanent effect upon the mind? We derive pleasure from a beautiful picture; and if seen for the first time, the feeling is exaggerated by surprise and suddenness. At subsequent visits, such adventitious circumstances grow fainter and fainter, and our pleasure becomes more and more calm; till at length—supposing the object constantly present—we view it without any apparent emotion at all. But it is a mistake to suppose that the effects of this form of the beautiful have disappeared with their external phenomena. We feel the picture, without seeing it. We breathe in its invisible presence an atmosphere of beauty, as unconsciously as we inhale the vital air.

Beauty, therefore, is not a mere toy of the fancy, but an important agent in human progress. It is not a luxury, but a necessary. It is not adapted for one class, but for all. It would be untrue to say that beauty is not studied as an art: but hitherto it has been studied from false motives, and in a mean and contracted spirit. Governments and municipalities exercise what architectural taste they may possess, from some vague idea that a combination of the elegant with the useful is necessary to their dignity and character. Rich men lay out their parks and gardens, and fill their houses with agreeable objects, to gratify their own instinctive yearning after the beautiful; and if they extend their care to a cottage or a hamlet, it is merely because these are adjuncts of the physical picture. But no one fancies that beauty is, in reality, a public good—that it should be followed as a moral virtue—that it should be taught and disseminated as a powerful means of making mankind happier and better.

We met, the other day, with an illustration of the in-

fluence of natural scenery upon the human mind, which we could hardly have hoped for. It occurs in a little work entitled 'Settlers and Convicts in the Australian Backwoods,' written by a hard-working self-taught mechanic, who was struck with the effect of the localities in which they laboured upon the character of the convicts. 'Inanimate nature,' says he, 'is universally lovely in these wildernesses; and a cheerful unprejudiced eye may often observe strange assimilations going forward, in the human character, to the faultless still-life around, which God has retained under his own more immediate control.' There is deep, however unconscious, philosophy in this remark. The beauty of external nature is, in truth, the immediate work of God, intended to act morally upon the mind of man. But the mind must to a certain extent be prepared to receive its impressions. Beauty, for instance, has had no more effect in civilising the Australian savage, than in taming the kangaroo; whereas, within the heart of even the worst European convict, there is a hoard of gentle feelings and holy recollections which, buried though they be under the accumulations of vice, and folly, and wo, may be drawn forth by the congenial influences of nature.

This of itself is a sufficient answer to those, if any such there be, who inquire, What is the use of beauty? Such persons, we presume, would measure the utility of a public park by the extent of its area, by the number of cubic feet of fresh air it presents to the lungs of the people—ignorant that the health of the visitors depends in as great measure upon the picture presented to the eye. They would throw open the national galleries, the cathedrals, and the palaces, in order to improve the mind by facilitating the study of styles of art, ignorant that the tendency of such exhibitions is towards a still more important improvement—that a spirit of beauty hovers amid these pictured walls and fretted vaults, with healing on its wing!

All these are large objects—hills and valleys, woods and waters, parks, museums, collections of pictures, and sublime or elegant edifices; and their influence will be obvious in proportion. A walk or ride in a picturesque country, or sail on a river or on the sea, are not merely beneficial to the body, as is commonly supposed, but likewise to the mind. Neither do they act upon the one through the other. The one inhales its aliment or medicine by means of the lungs, or imbibes it by the pores of the skin; while the other depends upon entirely different faculties for those images of peace or joy whose province it is to heal the spirit, by elevating it above bad and anxious thoughts. Similar wholesome images will be induced by a museum of specimens, a collection of pictures, or a concert of music, where there is no fresh air for the nourishment of the body; and the view of a fine cathedral, even when the visitor is a wholly uninformed person, will come in as a more im-

portant moral adjunct than is commonly supposed to the great truths enunciated at other times from its pulpit.

But great objects are not accessible on all occasions. Few of us, in this hard-working country, can very often walk, or ride, or sail, or go anywhere in search of what is called, however erroneously, mere amusement. Beauty, however, is not confined to places or things: it is omniform and ubiquitous. It exists in the plot of ground before the cottage, as well as in the garden or park; in the flower-pot on the sill—in the tuneful cage hung up by the window—in the picture on the wall—in the form of an article of furniture—in the colour and shape of a gown or cap. It is a mistake to blame even the very poorest for the indulgence of taste—or rather it is a mistake not to cultivate taste in them as a means of moral improvement. Extravagance in dress, or anything else, has nothing to do with the question of beauty; and, at anyrate, the extravagance of the poor is usually confined to matters of quite another kind. Preach to them, if you will, of the virtue of economy, the uses of time, the madness of intoxication; but spare the flower—the bird—the picture—the something—the nothing—which serve as bonds between them and the universal spirit of beauty. Touch not with irreverent hand the household gods that consecrate the homes of the poor!

'A thing of beauty is a joy for ever.'

No one can have failed to observe that cleanliness and neatness go hand in hand. A woman who is careless of the form and becomingness of her dress, is always an economist in soap and water, if in nothing else; and a slattern—a despiser of the virtue of beauty—is as bad as a pestilence at the fireside. She cannot be careless of her dress and person, without becoming careless of her husband, children, household, and generally of all her moral duties. In the present day, more especially, there is no excuse for inelegance in dress, nature and simplicity being the rule of fashion. 'We are inclined to think,' says the Quarterly Review on this subject, 'that the female attire of the present day is, upon the whole, in as favourable a state as the most vehement advocates for what is called nature and simplicity could desire. It is a costume in which they can dress quickly, walk nimbly, eat plentifully, stoop easily, loil gracefully, and, in short, perform all the duties of life without let or hindrance. The head is left to its natural size—the skin to its native purity—the waist at its proper region—the heels at their real level. The dress is calculated to bring out the natural beauties of the person, and each of them has, as far as we see, fair play.' Such being the female costume, a peasant may exercise as much taste in regard to it as a peeress; and as for colours, thanks to the perfection of our manufactures, the two parties are pretty nearly equal.

There is nothing that shows more completely the connection between external and internal beauty, than the impressions we receive from the human face and form. Habitual bad temper gives the effect of ugliness to the loveliest features; and habitual good temper renders the plainest agreeable and attractive. And these, be it observed, are the qualities of the features themselves, and do not depend—as is the case with those of an inanimate object, when a change takes place in the impressions we receive from it—upon the mood of mind of the observer. The handsome features are admitted to be correctly chiselled, and the plain features to be irregular, if not grotesque; but the character of both is changed by something we call *expression*. This

expression is the spiritual part of beauty. An inanimate object gives us more or less pleasure, according to the state of mind in which we view it; but, strictly speaking, it has in itself only one expression, one form and degree of beauty; while in a human being, in whom spirit dominates over matter, the physical part takes its character almost exclusively from the mind within.

The contempt which some people affect for physical beauty of face and form, is not only irrational, but in a certain degree impious. Such beauty is of a higher kind than that of a star or a flower, on which even the most stolid think it decorous to bestow their admiration; and when sanctified and sublimed by the holy light from within, it is undoubtedly the most admirable of all the works of God. But the pleasure it gives is entirely dependent on the kind and degree of this intermixture of the esoteric and exoteric: a fact which may be placed in a sufficiently obvious light, by supposing a face of absolute perfection in the mould of the features, yet destitute of one ray of intelligence—the face of an idiot. This face excites horror instead of admiration. The deprivation of moral beauty has a similar effect to that of intellectual beauty; and in less extreme cases than those of utter fatuity or depravity, while fully admitting the physical advantages that may be possessed by the features, the pleasure we derive from them is in exact proportion to that more ethereal loveliness perceived by the mind, like all its other ideas, through impressions made upon the senses.

Upon these principles might be explained and reconciled certain varieties in Love, which are usually treated, at least by the grave, as irrational or ridiculous. The love of a child has no reference to form or feature. It selects its object by means of an instinct which penetrates beyond the surface, and finds no difficulty in dotting upon age, ugliness, and disease. The youth gradually forsakes the idols of his infancy as he grows up; and the young man, whose natural perceptions are entirely obliterated in the school of the world, attaches himself frantically to mere physical beauty. In the course of years—perhaps not till many years—a change ensues. He finds that he has been worshipping a phantom, grasping at a shadow—that his love was a mere delusion, and his happiness or misery nothing more than a feverish dream. Then comes the triumph of mind over matter. Then do the plainest features become luminous with love in the eyes of the *rueful* man of the world. But judging no more by the unerring instinct of childhood, he is frequently deceived; and on such occasions he feels a pang far more terrible than that with which he had started from the golden visions of youth. But all is at length past—instinct obliterated, the lessons of experience forgotten; and the old man returns, with imbecile energy, to the illusions of early life, to dote once more upon physical beauty.

We have now run through a few of the common forms of the beautiful; but the catalogue is capable of almost infinite extension, and might be crowded with such incongruous images as are heaped together by a modern French poet, in his definition of the kindred word 'charm':—

'A charm? It is a vision wove
By passion—an enchantment deep—
The first sweet kiss of bashful love—
The smile that lights an infant's sleep;
It is a yellow leaf the wind
Bears wildly from the withered bough—
The calmness of the thoughtful mind—
The paleness of the thoughtful brow—'

And so on through a multitude of things, all distinct

from each other, but all adapted to excite emotions of pleasure or admiration.

But our object is to show the use, permanence, and importance of beauty, as a medicine both for mind and body; and to suggest that, in cultivating the taste, we advance the moral improvement of the people. In this point of view there is philosophical truth, as well as poetical elegance, in the line of Keats, which serves as a title to these desultory remarks—

'A thing of beauty is a joy for ever.'

THE GARDEN OF THE GLACIERS.

BEING at Chamouny, and the weather beautifully fine, I determined to lose no time, but to visit the Jardin immediately; for I had heard, from authority I could not doubt, what a gratifying excursion it was. Accordingly, on Monday, July 22, 1844, we left Chamouny, at an early hour in the morning, for the Montanvert, which we reached in such good time, that, after a moderate halt, we were able to set forth again at a quarter past eight o'clock. We were only two in party, but we were attended each by our guide; I by Ferdinand Tissay, who accompanied me to the Buet; and my companion by the celebrated Joseph Coutet. After half an hour's rough walking, we had to pass some precipitous faces of slaty rock, called Les Ponts, where the footing is very narrow, though firm, and where a fall would be attended with certain destruction. These once past, it became our object to launch ourselves on the ice of the Mer de Glace, a matter not always easy of accomplishment—for the glacier, far from presenting a smooth unbroken surface, running up to a regular and gently-sloping shore, is rather to be likened to a tempestuous sea, with gulfs and chasms fixed between it and its inhospitable iron-bound coast; and our search for a smooth point of ingress was precisely analogous to the waiting of seamen for a lull, before launching a boat through the breakers. At last we found a smooth bridge of the unmelted winter's snow, reaching from the side of the rocky glacier-bed to the ice, by means of which we set foot on the Mer de Glace itself, and forthwith commenced the usual and inevitable marchings and countermarchings, to which the countless impediments of the glacier give rise. But before we proceed with the narrative of our day's excursion, it would perhaps be better to give some general account, however brief and slight, for the benefit of those who never have seen or set foot upon one, of what a glacier actually is. It may make the detail of our narrative more intelligible.

First, then, glaciers manifestly can exist only among snow-clad mountains; but snow-clad mountains do not necessarily produce glaciers. Why they do not, is not now the question. However, high mountains in every part of the world are covered with snow; for the fact is, that the atmosphere becomes colder as we ascend; so that, at a certain height called the snow-line, above the earth's surface, snow is always lying. This height is greatest at the equator—namely, 16,000 feet; which, in the Swiss Alps, is diminished to 8700 feet above the sea. In very high latitudes, the natural covering of the earth is snow. But it must be borne in mind that snow always lying on any spot does not lead to the inference that snow never melts there. If the snow never melted, a perpetual progressive accumulation would be the result. The position of the perpetual snow-line is nowhere the line of perpetual congelation. The snow-line is determined solely by this

circumstance, that in the course of a year the snow which falls is just melted, and no more. Now, a snow-clad mountain is not a glacier. The common form of a glacier is a river of ice, filling a valley, and pouring down its mass into the valleys yet lower. It is not a frozen ocean, but a frozen torrent; wherefore the appellation of the Mer de Glace is calculated to convey an erroneous notion of the great glacier stream to which it is applied. Its origin or fountain is to be sought for in the ramifications of the higher valleys and gorges, which descend among the mountains perpetually snow-clad. But what gives to a glacier its most peculiar and characteristic feature is, that it does not belong exclusively or necessarily to the snowy region already mentioned. The snow disappears from its surface in summer as regularly as from that of the rocks which sustain its mass. It is the prolongation or outlet of the winter world above. Its gelid mass is protruded into the midst of warm pine-clad slopes and greensward, and sometimes reaches even to the borders of cultivation. The very huts of the peasantry are sometimes invaded by this moving ice; and many persons now living have seen the full ears of corn touching the glacier, or have gathered ripe cherries from the tree with one foot standing on the ice.

The lower end of a glacier is usually very steep and inaccessible. The mean or middle portion is a gently-sloping icy torrent, from half a mile to two miles wide, more or less undulating on its surface, and this surface more or less broken up by crevasses, of a width of from a few inches to many feet, and of a length which sometimes extends from side to side of the glacier. This, its middle portion, too, is covered with blocks of stone, which move along with it, or rather are borne down upon its surface. The motion of the glacier is inferred from the subsistence of the ice in valleys where the daily waste is immense, and where yet the glacier maintains its position; but its progress is also well-marked by the displacement of great blocks of stone upon its surface, which, from their size or figure, cannot be mistaken, and which may be watched from year to year descending the icy stream, whose deliberate movement they mark, as a floating leaf indicates the speed of a current of water! These rocks are detached from the cliffs, and may be seen to fall almost every summer's day, in consequence of the loosening of the icy bands which hold together fragments previously wrenched asunder by the irresistible expansion of freezing water. The stony borders now described are called moraines; which further have the epithets lateral or medial applied to them, according as they are formed by blocks detached at the sides of the glacier, or by blocks detached from the promontory or common point of meeting of the sides of two glacier streams that unite in one; a point manifestly in or about the middle of the new glacier stream resulting from the union.

Persons who have never seen a glacier, may naturally suppose that its middle or lower part is fed or increased by the snows which fall annually on its surface. This is an error; for the snow as regularly disappears and melts from the surface of the glacier, as it does from the surface of the ground in its neighbourhood. Here and there, in shady nooks, we see patches of the last winter's snow, of a dull, dead white, and without an approximation to the character of ice. In whatever way the middle and lower glacier may be maintained, it is most assuredly not by the assimilation into its substance of the fallen snow of winter. The case, however, differs in the higher ice world; and thither our excursion to the Jardin is about to lead us. Of these upper regions it is to be observed, that the snow disappears more and more tardily as we ascend, until we reach a point where it never disappears at all; in a word, until we reach the snow-line upon the glacier.

There are an immense number of additional most interesting phenomena connected with glaciers. But the main points respecting them to be borne in mind are, that they are the outlets of the vast reservoirs of snow

of the higher Alps; that they are icy streams, or rather *bonâ fide* streams of ice, in constant flow, however slow their motion; and that the existing state of human knowledge concerning them, as put forth by the highest known authority on the subject,* amounts to this: that a glacier is an imperfect fluid or viscous body, which is urged down slopes of a certain inclination by the mutual pressure of its parts.

To resume, then, our narrative. As soon as we fairly set foot on the great glacier of the Mer de Glace, we began our course in apparently interminable windings amongst crevasses, blocks of stone, glacier tables, and moraines, of which latter impediments we had to force a passage over three distinct embankments which follow the stream of the great glacier, the Mer de Glace, from the lesser and higher Glacier de L'Echaud. Glacier tables are very singular phenomena. When a large block of stone lies on the surface of the glacier, its area and thickness defends a portion of the surface of the ice from rain and the heat of the sun's rays; in a word, defends the ice immediately under it from causes of thaw, which act on the exposed ice all around; so that, whilst the general neighbouring surface of the glacier in the summer sinks down, the particular spots underneath the greater blocks remain comparatively unchanged; that is, stand up above the general surface, surmounted by the blocks of stone that were in the first instance their protection; in fact, their umbrellas. Hundreds of these tables are to be seen, standing up like enormous mushrooms, all over the glacier. That the glacier should be rent and torn in countless crevasses, is very conceivable, when we consider that it is an imperfect fluid, pressing, slowly yet forcibly, through a rocky mountain-channel of ever-varying width. The phenomena of moraines have been partially explained above. They are so far analogous to the glacier tables, that they are not what they at first sight appear to be—an embankment solely consisting of immovable rocks—but are a bank or ridge of the smoothest ice, strewn with rocks, in a state of nice equilibrium; the bank of ice having originated from the protection afforded it by the mass of rocks from the ordinary causes of thaw. Single small stones, on the other hand, lying on the surface of the glacier, do not protect it from causes of thaw; and besides, becoming heated by the sun's rays, they melt their way into the ice, and disappear in deep holes, like small wells, which they have themselves originated. All we here saw or did in the course of our walk was highly interesting; for we had never before set foot in these regions of eternal ice. At half-past ten we arrived at the foot of the Couvercle, which it is necessary to ascend. The weather was so fine, and the air so clear, that out of pure indulgence we sat down here for twenty minutes to look about us, and thoroughly enjoy the scene. We had now a most sublime view of Mont Blanc, of the Great and Little Jorasses (little by comparison), of the Aiguille du Géant, of the Col du Géant, and of the countless towering Aiguilles of the entire chain of Mont Blanc. Trees we had now left far below us, but verdure not entirely. The scenery was made up of peaks and precipices, eternal ice and snow, diversified here and there with some scanty sheep, or rather, perhaps, chamois pasture.

Next we commenced the ascent of the Couvercle, during which we obtained admirable and astonishing bird's-eye views of the crevasses of the Mer de Glace below us, and of the junction of the Glacier du Taléfre with the Mer de Glace, into which it falls in a style of extraordinary magnificence. The glacier is here brilliantly white; and by the extreme steepness of its descent, it is torn and disrupted into countless fantastic blocks, obelisks, and pyramids of ice, tossed about capriciously, as if by the wild supernatural agency of the spirit of the mountain. From some points of view, though this particular portion of the Glacier du Taléfre

can scarcely have a fall of less than 2000 feet (a mere guess, however), one is tempted to compare it to a frozen cataract. But this comparison soon fails to hold good; and the idea that suggests itself is rather that of an enormous mass of crystals, gigantic out of all measure, yet endowed with the regularity and beauty of a specimen in a cabinet of mineralogy. This is in accordance with what I have not seldom had occasion to remark; namely, that when an object of our contemplation vastly exceeds all our ordinary notions of grandeur, there exists a tendency in our minds to compare it with something incalculably less, and even meaner; and that, strange to say, such comparisons are generally far from being inapt. I have heard the epithet *chaotic* applied to this and to other glaciers, but it is surely as unfitting an epithet as can be applied to a natural process in regular action. With this, then, together with other glorious objects alternately in sight and alternately hidden, after a steep ascent, we arrived at a plain of perpetual snow; and after passing, with some difficulty as to footing, over the snow that fills the theatre of precipices whence the Glacier du Taléfre issues, we arrived exactly at seven minutes after twelve at the Jardin, in three hours and fifty-two minutes from the Montanvert.

The height of the lower part of the Jardin above the sea Professor Forbes gives as being 9042 English feet, and that of the highest part as 9893 English feet.

The Jardin (or *Courtill*, as it is called in the *patois* of the inhabitants of Chamouny) possesses little beauty of its own. It is a mass, or rather a not inconsiderable extent of barren rocks, interspersed with scanty verdure, and adorned with a few wild Alpine flowers. It does not appear, when you first arrive at the spot, that it is indeed insulated in the midst of the icy desert of the glacier, although you may afterwards ascertain that it is so. The outlet in this vast encincture, from whence the glacier issues, has been compared to a volcanic crater with a side blown out. The view all around you is the most rugged, savage, and solitary that can be conceived; and the interior recesses of Mont Blanc, as you look over the great glacier of the Tacul (another glacier stream tributary to the Mer de Glace), are beyond description grand. With the exception of the scanty verdure growing around us, nothing was visible but rocks, ice, and snow. The weather, as I have before noticed, was exquisitely beautiful; and we remained at the Jardin an hour and a half, enjoying the brilliant calm sunshine, which at times was almost too hot, notwithstanding the fresh air from the glacier. Whilst we were eating our luncheon in this wild place, two large crows kept flying round and round, evidently watching us; and as soon as we were on the move, they flew to the spot where we had been sitting, in order to pick up the fragments of our meal.

At the Jardin is a broken bottle full of cards and papers, with the names of persons who have visited the spot written thereon. At about half-past one we began our descent. Soon after we left the Jardin, I managed inadvertently to dislodge a large stone, which, as the words of my journal run, surmounted a bank of ice covered with gravel—in other words, a large stone of a moraine; and in order to avoid grave mischance, I had to make a run for it, on a soft slope of snow, on which walking was not altogether an easy matter. The result, as might have been expected, was a fall; and besides that, I rolled some way down the wet and steep descent. This was a fair specimen of the way in which the most serious accidents may occur; but I saw the danger of coming in contact with the stone, and was prepared for anything rather than encountering the full career of the Sisyphæan burden I had let loose. Coutelet and the rest good-humouredly rallied me on my extraordinary activity. At length we came to the foot of the Couvercle, and once more set foot on the Mer de Glace; and made the best of our way to the little alberge on the Montanvert, which we reached at five minutes before four o'clock, having descended from the

* Professor Forbes of Edinburgh.

Jardin in two hours and twenty-five minutes, and having been absent from the Montanvert seven hours and forty minutes. We then returned, all together, to Chamouny.

VULCANISED CAOUTCHOUC.

SEVERAL years have elapsed since our last notice of the wonderful material, caoutchouc.* During this period our consumption and the importance of the article have expanded in an equal and surprising ratio; and we should be at a loss at this moment to mention any other substance as taking a more varied and peculiar ratio in utility to man. Its wonderful cohesive force, its property of resisting compression, its impermeability, its elasticity, and its facile accommodation to a host of the wants of mankind, render caoutchouc a substance of great interest at all times. Latterly, however, a new method of treating the material, bestowing upon it a vast increase of its valuable peculiarities, besides endowing it with some new properties, has been discovered. We therefore believe it will interest our readers to offer some account of this new process, which has received the title of 'Vulcanisation, or Conversion.'

Caoutchouc is imported into England in the form of plates and tablets, as well as in the pyriform bottles more familiarly known. Some specimens of the liquid, from which the material is prepared, have also been brought in hermetically-sealed flasks. In this condition it resembles a thick yellow cream; and when applied as a varnish, covers the substance over with an impermeable coating. Since the first introduction of this material to the present hour, it has been an insoluble problem to chemists to restore solidified caoutchouc to its primitive condition: the ordinary solvents of the substance producing a liquid which has few properties in common with the natural fluid, besides that the solution exhales an offensive and pungent odour for a considerable period after its application. Immediately on exposure, the liquid product of the tree separates into two parts, and caoutchouc rises to the surface like the cream of milk. It would, therefore, appear probable that a chemical influence is exerted by the air upon the fluid, since it remains in a great degree unaltered if the access of air is prevented. To render the imported caoutchouc applicable to the purposes of commerce, it requires to undergo a certain amount of preparation. The eminent French chemist, M. Dumas, thus describes this process:—The caoutchouc is taken in the pyriform or tablet condition, and is first pressed between two cylinders, while a current of warm water is permitted to flow over it; in this manner the foreign ingredients and impurities are removed. It is then put into a hollow cylinder, and, by mechanical aid, is subjected to a violent kneading process, during which a large amount of latent heat is evolved; by this means it eventually becomes quite soft, and may be moulded into whatever form is most desirable for the purpose intended. It is then cut by machinery, with the assistance of a constant current of warm water, into sheets; or these may be cut from the masses, as imported, without the preparation described by M. Dumas; or into a delicate elastic thread; or it is cut into shreds for the formation of the solution. At an early period of its introduction into England, caoutchouc was sold to artists at a guinea the ounce; it is now procurable, retail, at from three to four shillings the pound. Caoutchouc is soluble in ether, rectified oil of turpentine, naphtha, or oil of coal-tar, and in the bisulphuret of carbon. Of these, the latter, and the offensive liquid naphtha, are the solvents most frequently employed. Messrs Beale and Enderby of London have discovered a new liquid for its solution, obtained by the destructive distillation of caoutchouc itself; an oily fluid is the product, and has the property of readily dissolving the substance from which it is procured. As a certain

weight of caoutchouc put into the still yields a weight of the oil nearly equal to itself, there is not much loss in the process.

The applications of unvulcanised caoutchouc have of late years been very numerous. In solution, it has been applied for coating over cordage and cables, to protect them from the destructive influence of salt water. An early application of the same liquid was in the manufacture of the invaluable impermeable cloth; of this a new variety has made its appearance within the last few months. Those valuable little articles known by the foolish name of India-rubber corks, are also a production of recent date. They are formed of small stoppers of cotton, coated externally with a thin caoutchouc membrane. They are in some respects vastly superior as stoppers to cork, in others they are inferior to it. In the laboratory, sheet India-rubber is quite indispensable; it supplies the place of a mass of expensive and easily-deranged mechanism of brass-joints and unions: it is easily made into a flexible tube, by taking a narrow ribbon of the membrane, slightly moistening the edges with turpentine, and laying them together over a glass tube; they immediately adhere with surprising tenacity, and in a few minutes the elastic tube is completed. Caoutchouc, in fact, may be said to have contributed in no small degree to the perfection of the experimental chemistry of the day, its economy and utility being equally appreciated in labours which always involve a considerable outlay, and offer, in the generality, few remunerative returns beyond the acquisition of truth. In mechanical surgery caoutchouc is equally serviceable, forming elastic bandages, impermeable plasters, flexible tubes, and the recent elegant substitute for a poultice—a kind of half-sponge, with an India-rubber back to it; besides forming instruments of many kinds of great value but small cost. Among the most important applications of caoutchouc, is its use in the formation of the celebrated marine glue. The caoutchouc is dissolved in oil of tar, or naphtha, and to the solution is added a certain quantity of shell-lac; these are melted together, and by their union, form the almost invincible adherent in question. The masts of ships have been united by it, and then forcibly fractured; and on examination, it has turned out that the fracture has taken place, not at the junction, but in the very fibres of the wood itself. Our readers are probably familiar with the other experiments made at Woolwich upon the strength and tenacity of this material, the most striking of which was, that a ball of wood, sawn in half, and united by the glue, was fired from a cannon, and was found with the union absolutely unshaken in the least. It was even projected that an entire vessel might be constructed by its assistance, without the use of nails and bolts, or at any rate their use might have been in a considerable degree dispensed with. It may be mentioned here as probable, that in some measure caoutchouc contributes to the elaboration of silk, the mulberry leaves upon which the silk-worm feeds yielding caoutchouc in great abundance. It is possible that it will not be long ere we shall have caoutchouc formed artificially for the purposes of commerce. Dr Ure mentions that linseed-oil, rendered very dry by being boiled with a metallic oxide, and exposed to the air for six or seven months, became very much like caoutchouc, was wonderfully elastic, and possessed other properties resembling that substance.

To return, however, to the more immediate subject of our notice—vulcanised caoutchouc. Mr Brockedon, whose name is well known as connected with the subject of which we are treating, describes the process by which caoutchouc acquires its new properties to be the following, the merit of which is due to Mr Hancock:—The caoutchouc is immersed in a bath of fused sulphur, heated to a proper temperature, until, by absorbing a portion of the sulphur, it assumes a carbonised appearance, and eventually acquires the consistency of horn. The same condition can, however, be produced by either kneading the India-rubber with sulphur, and then ex-

* See No. 453 of our former, and No. 33 of our current, series.

posing it to a temperature of 190 degrees Fahrenheit, or by dissolving it in any of the common solvents, as turpentine, holding sulphur in solution or suspension. A similar process is that of 'conversion,' only in this case the caoutchouc combines with sulphur under a different agency. The bisulphuret of carbon, mixed with sulphur, is in this instance made to act upon the India-rubber, and causes it to undergo a change on the surface; but it cannot be penetrated to any great depth by such means, and the process therefore becomes inapplicable to masses of any density. The rationale of these operations appears to be, that the India-rubber forms an actual chemical compound with the sulphur; becomes, in short, a sulphuret of caoutchouc, the properties of which are thus enumerated:—The new compound remains elastic at all temperatures, while ordinary caoutchouc becomes inelastic and rigid at a few degrees above the freezing point of water; vulcanised caoutchouc is not the ordinary solvent, neither is it affected by heat within a considerable range of temperature. Finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Some interesting experiments have been made upon this new compound. Most of our readers are familiar with the construction of the powerful spiral spring in use for the 'buffers' of railway carriages, to moderate the effects of concussion; their ordinary strength is such as to demand a pressure equivalent to three tons and upwards, to compress the spiral close together. Mr Fuller has invented a form of spring, in which vulcanised caoutchouc takes the place of the steel, and the surprising result is, that the India-rubber springs are more than *three times* the strength of the metallic; that is, they will resist, at the height of their tension, a pressure equal to from *five to ten tons*. A more forcible evidence of the strength of this material was obtained by firing a cannon ball through a mass of vulcanised caoutchouc, and it was found literally broken to pieces, while there was scarcely a perceptible rent in the caoutchouc itself.

Gifted with these new powers, vulcanised caoutchouc has already been called into extensive employment for the most various and opposite purposes. It forms, in hydraulic engines of all kinds, one of the most valuable materials for 'washers,' applying itself so accurately to the surfaces between which it is placed, as to prevent the slightest leakage, other things being equal. In this capacity, and from its power of resisting heat, it has also been proposed for the use of steam-pipe joints. It forms an admirable spring, more docile and more equal in power than those of steel: it has been for this purpose applied to locks and window-blinds. It may be here mentioned parenthetically, that by proportioning the ingredients, the material may be rendered harder or softer at will; and that for some purposes it is used in the former, for others in the latter condition. It is manufactured also into the most elaborate ornaments,* being superior to leather in the sharp outline and bold relief of their detail. It is formed into a tubing of great strength and flexibility, well adapted, the consideration of expense excepted, for fire-hose, and for any apparatus required in conveying steam, water, or gas. We have seen this tubing wrapped together, twisted, and knotted into every conceivable shape, and instantly resume its contour as soon as it was liberated from its restraint. This tube promises to become invaluable in the construction of life-boats, superseding those made of canvas, which were slowly destroyed by the influence of sea water. A curious use to which it has been put, is as a substitute for the iron tire or hoop of the carriage-wheel: the advantages it is said to afford are a much lighter draught, and an absence of noise. In dry weather, the first postulate may be granted; but in wet, and upon the greasy streets of the metropolis, the wheels act like suckers on the pavement, and cannot

fail to increase the draught of the vehicle; besides, noise itself is a *safe* nuisance, and could not very comfortably to pedestrians be altogether dispensed with. Its most important application is in its use in railways, and, as has been mentioned, in railway carriages. It is laid between the rail and the sleeper, and thus prevents the rails from indicating any traces of pressure. The useful little articles 'elastic bands' are made of this substance. Besides all these applications, it is proposed to apply it as a coating to protect the wires of the submarine telegraph from the influence of the sea water: it forms impervious bottles for ether, inkstands, trouser-straps, gloves, boots, surgical bandages, and a number of other articles, for which its nature almost seems to have been expressly designed.

THE ARMENIAN LEPER.

TOWARDS the close of one of those long bright sultry days which succeed each other with such unvarying sameness during the summer of Asia Minor, a caravan consisting of a string of some thirty or forty camels defiled slowly through the beautiful vale of St Anne. This magnificent valley, at the entrance of which lies the city of Smyrna, in all the pride of her Oriental beauty, is of vast extent, and remarkable for its luxurious vegetation. It stretches many miles into the interior of the country, closed in on all sides by lofty mountains.

The picturesque procession having wound through the last deep ravine, at the steady undeviating pace of the untiring camel, at last emerged into the open country, and came to a halt. It was here that the travellers, who had availed themselves of the protection of the caravan so long as their path was the same with its appointed course, were to separate from their companions, and choose each his track over the wide desolate plain that lay before them. These were chiefly Europeans; and amongst the number were two young Englishmen, who, having heard that somewhere in this direction the remains of a temple had been lately found, had set out in quest of it, although with only an indefinite idea as to the locality of the ruins.

The tinkling of the camel bells was scarcely lost in the distance before the adventurers began to bethink themselves of the admonitions they had received from their companions. The night had fallen so suddenly, that it seemed as though the darkness had been absolutely hurled down upon the earth from the depths of the dark blue sky. No indications of the ruins they sought presented themselves; and what was more, the Smyrniotes had not left them in ignorance that no human habitation existed within a distance of very many miles.

For a time they wandered recklessly on, thinking they would find a couch quite soft enough among the low aromatic shrubs which clothed the desert where they were roaming; but soon the idea of quitting their saddles at all was tacitly given up, notwithstanding the fatigue of their jaded horses; for on all sides, now far off, now so near that they started involuntarily, rose the ominous howling of the beasts of prey, whose numbers render the vicinity of Ephesus so dangerous. They were now greatly at a loss how to proceed, or in what manner to pass the night till the returning day should enable them to shape their course in safety, when suddenly they perceived a faintly-tinkling light gleaming on the plain at a short distance before them.

Greatly surprised at a sight so unexpected in this dreary solitude, they gladly hurried towards it, and soon distinguished in the dim starlight the dark outline of a heap of ruins, where broken arches and prostrate columns lay mingling together. They had no doubt that this was the temple they were in search of; but the light which now appeared to burn steadily in the interior was not so easily accounted for. Advancing to the spot, they dismounted; and having fastened their horses to a pillar, proceeded to explore the ruins, which

* We are indebted to the report in the *Athenæum* of Mr Brockedon's paper for many of these particulars.

were of considerable extent, on foot. Guided by the mysterious ray, which brightened as they approached, they at length reached a large rudely-constructed aperture, through which they could perceive a small lamp placed in a niche of the wall, which strongly illuminated a very singular chamber. The broken pillars, with large stones brought from some other part of the building, had been so disposed as to form a circular wall, whilst the roof had originally been a part of that of the temple itself: a window and a door facing each other had been fashioned with considerable skill; and a couch, composed of the long leaves of the Indian corn, carefully dried, showed that it was the habitation of a human being. Directly facing them, the occupant of this strange apartment himself was seated, intently engaged on some absorbing employment, whilst a large book lay open at his side. He was a man seemingly of some fifty years of age, with a mild and pleasing countenance, which was stamped with a peculiarly calm and peaceful expression. His dress was that worn by the Armenians of the lower orders; and his long beard and flowing hair rendered his appearance strikingly picturesque.

The intruders gazed at him for a few minutes, and then advancing, were about to enter the apartment to crave his hospitality for the night. At the sound of their footsteps, the solitary man suddenly started from the ground, and as soon as his eye fell on the strangers, careless of the customary forms of eastern politeness, he held out his hands as though to ward them off, and exclaimed, 'Stand back! At your peril come no farther!' He spoke in Italian; and the Englishmen, half-smiling at the idea that he probably took them for robbers, answered in the same language, 'You need not fear; we will not injure you.' A smile, in which there was intense melancholy, passed over the lips of the solitary.

'You will not injure me, I well believe,' he answered in a low sad voice; 'but I should harm you.'

'How!' exclaimed the strangers, instinctively grasping their pistols.

'Not willingly,' continued he. 'There is no danger for you, if you do not touch me; and if you require food and shelter, as I imagine you do, most gladly will I now afford you both. It has been my privilege to prepare a resting-place for travellers benighted like yourselves upon the plain, and it is my greatest joy when they avail themselves of it.'

The Englishmen looked at one another; for the manners and language of the solitary were by no means in accordance with the meanness of his dress and appearance. But he gave them no time for reflection: taking the lamp from the wall, he gathered his garments closely round him, and passing them at as great a distance as he could, said, 'Follow me; for at your peril you must not enter here!' They obeyed; and leading them to the door of a room somewhat similar to that he had quitted, he stood aside, and signed to them to enter. It was furnished with several couches of dried leaves, covered with panther skins; and in the centre stood a small table, roughly constructed of uneven wood. When the travellers had completed their survey, they found that their singular host had retired, leaving the lamp on the threshold; but in a few minutes he reappeared, carrying several vases of fresh water, and a large basket filled with grapes and other fruits, just gathered—a circumstance which seemed also somewhat unaccountable in the midst of a desert plain. These he placed at the door, and requested them to lift the provisions themselves on the table. As he stooped, the light of the lamp shone full in his face, and the strangers suddenly started with an involuntary feeling of loathing, as they became aware of the strange and deadly whiteness which characterized it. The solitary perceived and understood the movement; he crossed his arms on his breast (an attitude indicative in the East of entire submission), and said calmly, 'Even so; I am a leper.' The travellers had been long enough in the East to be aware of the virulent nature of this dreadful disease, and of

the unfailing certainty of its communication by contagion, though the touch by which it is conveyed were only from the garment of the afflicted person. They now, therefore, understood and appreciated the generous precautions of their unhappy host, and complied with his request to sit down and partake of the repast he had provided, whilst he himself sat on the ground at the door, in order to supply any wants which might occur to them.

Whilst availing themselves gladly of the refreshment they so much required, the travellers continued to look with deep interest on the sufferer, seemingly so patient under such a grievous trial; and but for the dread of reawakening his sorrows, they would have inquired into the details of a history that could not fail to be most striking. He was himself, however, the first to open the subject.

'You now understand,' he said, 'why it is that I live among these solitary ruins, an outcast and an exile, not from my country only, but from all mankind. My disease is the incurable leprosy, for which there is no hope till its power over my mortal body shall be replaced by the corruption of the grave itself. Living, I shall never more know the friendly pressure of a fellow-creature's hand; and dying, my fainting head must not even make its last resting-place on the bosom of a stranger!'

'What a fate!' exclaimed the Englishmen with the accent of pity.

'What a blessed—what a noble fate!' exclaimed the leper enthusiastically, 'if I thereby fulfil the purpose of my creation, as ordained by the All-Wise, whose prerogative alone it is to draw out good from evil! Inglesi, you look surprised to hear the poor forlorn leper speaking thus; but you are young, and your eyes are yet dazzled with the false glitter of this world's perishable joys. If you please, I will tell you the story of my life, and so accomplish a part of the end for which I suffer, if it teach you hereafter, when adversity shall stand upon your threshold, to open wide the door, and welcome to your hearth and home that destroyer of all selfish peace and blind security!' The strangers signified their satisfaction at the proposal; and the leper, drawing as near to them as he could consistently with their safety, began at once to relate his history.

'I am an Armenian by birth, as my dress sufficiently indicates; but you would not guess, from my appearance now, that I was the only child of the richest diamond merchant of Broussa, a fair Asiatic town, whose name, it maybe, you have scarcely ever heard. I was sole heir to all his wealth, and from my earliest infancy I dwelt in his splendid habitation, surrounded by every luxury which a pampered fancy could desire. He died when I was quite a boy, and I remained under the care of an uncle, who, being in fact dependent on me for support, was abundantly careful to gratify my every wish. This injudicious treatment might have been my ruin, had not my own inclination fortunately led me in a course that saved me from falling into idleness and dissipation. You are aware that we are Christians; the foundations of the Armenian church having been laid in the earliest days of an organised Christianity, and continuing with the same forms and ceremonies to the present day. From the first dawn of my reasoning powers it was my ambition to become a priest; not so much, however, from any particular vocation, as from the certainty that by this means alone I could have an opportunity of gratifying my studious propensities and passionate love of reading. Those only of the young Armenian men who are destined for the church receive any kind of education; and such was my intense desire for knowledge, that when, as a candidate for the priesthood, our libraries (which are extremely ancient) were opened to me, I went far beyond the regular routine of study incumbent on me as such, and devoted my whole time to the pursuit of science and learning. Having acquired all the more important languages of the East—the Sanscrit, Hebrew, and

others—I became desirous of gaining also those currently in use in Europe; and for this purpose I made a journey to Italy, for Broussa has little or no connection with the civilised world, and, more than any other town in Asia Minor, has retained its national characteristics and primitive customs. On my return I was admitted to the priesthood; and none could have been less qualified than myself for this high calling, as far as humility and self-denying virtue are requisites for it; but the authoritative power with which it invested me, suited well with my aspiring views; and this, along with my immense wealth and great reputation for learning, soon placed me in such an elevated position amongst my townsmen, as gratified to the uttermost my worldly ambition and inordinate pride. Ah! my friends, mine was then the leprosy of the soul—far worse than that which now afflicts my mortal body! Whilst the motives of my best actions sprung from no pure source, I avoided all outward contamination with the most haughty and fastidious care. Too slothful, and too greedy of man's applause, to practise asceticism and retirement from the world, I mingled freely with those of my fellow-men who would admire my knowledge and laud my seeming sanctity, whilst I turned away from all the sinful and degraded without an attempt to reclaim them. To such a height did I carry my abhorrence of all things unclean, that I neglected, in consequence, one entire portion of my duties as priest; this was the care of the leper hospital, established at some distance from the town as a refuge for the victims of that fatal malady, to which a retributive justice has now consigned myself. It is true, in flying from the very sight of these miserable beings, and scrupulously avoiding all contact with them, I only obeyed the custom of the country, and the still more universal law of self-preservation—that which actuates yourselves even now; but it is a rule of the creed I professed that a man should give his life for the brethren, if need be; and therefore that was in me a crime which in others was not so. But the hour of reckoning with me was at hand. There is a certain festival in the Armenian church, when it is customary that the priest should address the people. This was ever for me a day of exultation and vain display, for then only could I manifest the extent of my knowledge, and startle with the thunders of my eloquence.

I loved, in my arrogance, to tower over all that kneeling crowd, and show them what I myself must be in the high standard of virtue I presented for their example! The last time I performed this duty of my calling, the subject I chose was that of charity; and I found an ample field for my stern disdain and bold comparisons, in pointing out to them the wide difference between my own high theories respecting this universal law, and the practical system of its performance in Mohammedan countries, where the master of scores of tortured and crouching slaves erects an hospital for cats, or commands that, after his death, a little reservoir for the rain-water shall be hewn out on his tombstone, that the birds may come and drink. I showed them how, virtually, they had all renounced the common brotherhood which binds in one the human race; how, daily, their rude hands tore asunder the fraternal tie between man and man! And when I had concluded, I passed with haughty step through the ranks of my humbled listeners, and went out to a grove of cypress near the town, to indulge in the pleasant reflections which arose abundantly from my gratified vanity. I had wandered on for some time, wrapt in thought, when a deep groan, sounding near me, caused me to turn round, and I perceived an unhappy wretch, evidently in great suffering, vainly endeavouring to crawl to a stream that flowed near him, where he might quench his thirst. At a glance—as quickly as you, Inglesi, perceived the malady in me—I saw that he was a leper, and I could easily account for his forlorn situation in this wood, which was near the hospital I have already mentioned. In Asiatic towns, when it is discovered that a man is afflicted with leprosy, especi-

ally if it be that species of the disease which is incurable, he becomes, for all his friends and relatives, as one dead, and even those nearest and dearest to him renounce him as utterly as though he were a perfect stranger. Instantly, lest with an hour's delay the contamination should spread, he is driven forth, not only from house and home, but from all human habitation, and left to find his way, in the first agonies of his complaint, to the only refuge left to him, if he perish not on the road, as many do.

No sooner did this victim of so terrible a doom distinguish the footstep of a man, than, lifting up his voice, he implored of me, by every sacred name, to find means to give him to drink, for that he was perishing of thirst. But I, heedless of his misery, gathered carefully my robes around me, and fled from his presence with abhorrence. As I did so, suddenly, like a warning voice, I seemed to hear, re-echoed back upon my ear, the words which I myself had spoken but an hour before—the burning words, wherein I showed how charity meant love, and sternly announced that on every human being that law of love was laid, commanding them to cherish one another even to their own detriment! My friends, a man may hear the exhortations of another, and callously continue in his sins; but when by his own words he is judged, when his better self stands forward to condemn him, his conscience must be seared, more even than mine had been with all my pride and folly, to enable him to remain in obstinacy. I had been about to leave a fellow-creature to perish in the worst of agonies. I paused—I turned—I hesitated. Then it occurred to me that I could, without much peril to myself, enable the sufferer to reach the water's edge, by taking off my scarf, several yards in length, and giving him one end to hold, whilst the other, grasped in my hands, would enable me to drag him to the streamlet. How little I merited the blessings the leper invoked upon my head as he saw me turn! How he seized my girdle with the energy of one whose life depended on this aid! till slowly, and by toilsome degrees, I drew him to the river's brink. Alas! the effort had so exhausted him, that when there, he was incapable of standing on his feet to descend the bank and drink. I had again turned to leave him. I imagined I could do no more, though I saw that, with the water almost rippling to his feet, he could not obtain one drop for his parched lips. I moved away, despite of his cries. With one desperate effort he threw himself forward. He grasped my robe! I uttered a cry of horror! He seized my hand! Maddened with terror, I tore myself from his grasp. I flung him from me with a violence which sent him rolling backwards amongst the stones; and I fled, as though I were pursued by demons. For the next week, what a life was mine! For ever haunted by one ghastly fear, which embodied all I ever had most dreaded, this much of good was in me even then, that I avoided the personal contact of my friends and servants, lest, even before the disease declared itself, some contagion should spread: and wo is me! never before had the human voice seemed so sweet to me, or my soul so yearned for human sympathy! My heart seemed to swell, even to bursting, with tenderness for those whose friendly hand I dared not touch; and at last the struggle of my feelings was so violent, that I was seized with a raging fever, and became delirious. Inglesi, from that unconsciousness I awoke in the leper hospital! During my illness, the fatal disease communicated to me (as it could not fail to be) by that one touch of the leper's hand had declared itself, and nothing could save me, loved, respected as I had been, from the common doom of my fellow-sufferers: the curse was upon me which for ever separated me from the sympathy of human beings! This only they did for me, in consideration, perhaps, of the position I had held before—they had me conveyed in safety to the hospital, and did not throw me out on the roadside to perish, as was but too customary; but there they left me, and from that hour I existed no more for all who had known or loved me!

And I awoke to know this, to feel it; to shrink, and shudder, and moan, as I thought that henceforward my sole companionship was to be with those loathsome beings whom I had ever avoided with such deep abhorrence. I was one of them! Freely they gathered round me, and touched me, and placed their terrible deformity, in which I shared, before my very eyes! I could not bear it; I was maddened by the sight. One night I made my escape from the hospital, and fled back towards the town where I had dwelt, so blessed with all that earth could give. I well knew I never could regain my position, or the wealth of which my uncle had taken possession, according to the law; but I had a yearning to look on human faces not disfigured by that dreadful taint, and I rushed wildly onward to the gates, with a faint hope that I might enter unperceived. All fled at my approach, as I had fled when he implored me; and when I reached the town, I was driven back with curses. I turned to fly, and they pursued me, trying to stone me to death; but I was fired with all the energy of my despair, and escaped far into the desert, where at least if none were near to comfort, there was no leper's hideous face to torture me! It was night: a cloudless heaven was above me, a changeless wilderness around; and I was alone, struggling in a solitude which should be mine eternally, till I went to seek companions among the mouldering dead! Then the full horror of my sentence caused my brain to reel. I flung myself down upon the desert sands; I raved, I wept, and, in my despair, gave way to the most impious thoughts.

'In this mood I lay till morning dawned, and then I rose to look upon the scene around me—a wide, uninterrupted field of burning sand, where the sunbeams revelled in unbroken splendour. One prominent object only met my eye. Close to me grew a tall and graceful palm-tree, towering up against the deep blue sky. I advanced, and passed my arm round the slender stem, for I seemed to have a sort of companionship with it. Like myself, it was a lonely, solitary thing; and surely its existence in that vast desert must be useless, as my own would be henceforward. But as I looked on it, I was struck with wonder and admiration. In my happier days, I had been too much engrossed with my ambitious occupations and absorbing selfishness to have time to study the marvellous perfection displayed in the minutest works of nature, and now I gazed with almost childish delight on the exquisite beauty of every leaf on those long feathery branches, and the perfect adaptation of each delicate fibre or fold of veined bark to the purpose for which it was intended. The tree was thickly laden with fruit; the ripe dates strewed the ground all around me. I easily gathered a sufficient quantity to allay the hunger which had assailed me; and I then perceived that there grew, beneath the protecting shade of the lonely palm, several low bushes of the pitcher plant, whose bright green leaves do so marvellously take a vase-like form, and catch every drop of rain or dew till they have secreted a cool delightful draught, which has saved the life of many a wayworn traveller in the desert. With this I quenched my thirst, and with all my wants thus satisfied, I sat down at the foot of the friendly palm, and fell into deep meditation.

'This fair tree, alone in the desert, whose existence I compared to my own, had abundantly proved that it was not a thing created in vain, were it but for the relief it had even now afforded to my sufferings; and there was to me something ennobling in the idea, that the germ of the vegetable life might have been placed in the sand, and passed through the various stages of its mysterious growth and fruition, till it came to be this stately palm, with the sole purpose, as ordained by the Creator, of hereafter alleviating the pangs of one of His human creatures. Be this as it might, it was impossible for me not to perceive, as I continued to examine all the perfections of its formation, with eyes opening for the first time to the actual wonders of nature, that the consummate wisdom therein displayed

had been exercised for some one fore-determinate purpose, and that this purpose was good. Moreover, that guiding Power which had directed the symmetrical outline of each tiny leaf upon my desert tree, had doubtless in like manner ruled every passing event in the life of reasoning beings. In that case, if all things on earth were tending to the great consummation of the overcoming of evil by good, the individuality even of suffering might well be forgot in the joy of adding our petty efforts to so glorious an end. My past life rose up before me, with its vanity, its utter egotism, its evil, fostered continually in my own breast, and disseminated by my influence on others. Surely thrice welcome the leprosy which had torn me from my stronghold of pride and ambition, and cast me out into the desert, to be alone with—thought! My friends, I will not weary you with all my reflections during the long days when my mind was disciplined in that wilderness, till I learned to comprehend that, by the victory which one individual obtains over the germ of evil in his own bosom, the whole human race is advanced a step. Face to face with Truth, in the immensity of that solitude, I beheld all things in their real light, and became at last what I now am—most happy in trusting submission.

'After a time, I found that my friendly palm-tree was no longer sufficient for my wants; and besides, I was desirous of so regulating my future life, that I might be enabled, so far as my infirmity would permit, to perform my share in the great duty incumbent on every man—the continual endeavour to benefit his kind. I travelled on for many days, seeking a suitable resting-place as near as might be to the haunts of men—of those for whom I desired to live, though for ever cast out from amongst them. I came at length to this spot, and fancied that it seemed, as it were, prepared as a habitation for me; every facility was here afforded me of providing all that was necessary for my daily wants. The soil was good, and would readily admit of cultivation; and if I could establish a certain degree of communication with a village which lies at no great distance, I might thus obtain the seeds and implements which were requisite to make it yield the fruits you now see before you. I required but little; and I looked forward to a life of solitude without dread. The mosque belonging to the village stood, as those places of worship usually do, at a little distance from the habitations of the people; and I repaired thither next morning, keeping at a distance, where it was not possible I could injure any one. At break of day, as I expected, the muezzin appeared to sound the call to prayers; and when he had concluded, whilst he still stood on the minaret's gallery, I drew near, and addressed him without danger to himself. He willingly entered into the arrangement I proposed, and agreed to bring the provisions then necessary, as well as everything else I required, to a certain stone on the plain, where he was to find in exchange a magnificent diamond ring that still remained on the hand none had dared to touch. By this means I was enabled to establish myself, with all the comforts you now see around me, in this my home. Years have gone by since then: my vines yield fruit, my garden flourishes, and I am contented, or rather I am most happy, for I have found it possible, Pariah as I am, to link myself to the beloved human race, by the power of conferring benefits. My daily occupation is to weave the long reeds which grow on the banks of the stream into baskets and mats. These I cast on the bosom of the friendly rivulet, and its gentle waters bear them down to the village through which it flows; from thence they are withdrawn by the peasants, who sell them at the neighbouring town; and more than once, when the fructifying rains have delayed their beneficent dews, the produce of my work has saved them from famine.

'Inglesi, you have listened patiently to this tale, and now you must lie down to rest. To-morrow you return to the world, and it may be that, when you mingle with its dazzling pleasures, and are allured by its vain hopes, you will appreciate them at their true

value, remembering how an inward conviction in faith and trust could make a solitary leper thrice blest in a desert.'

Whether the Englishmen profited by these admonitions, the record sayeth not. Next morning they departed, to take their part in the stir of life again, but the Armenian leper still dwells alone among the ruins of the temple.

POETS AND FLOWERS.

THE former paper on this subject was confined almost exclusively to our older poets: the present selection will be taken from recent and existing writers; and in pursuing our researches, we cannot but be struck by the endless diversity of ideas and reflections to which the brilliant succession of floral tribes conduces. Johnson tells us, in his sententious style, that 'there is something inexpressibly pleasing in the annual renovation of the world, and the new display of the treasures of nature. The cold and darkness of winter, with the naked deformity of every object on which we turn our eyes, make us rejoice at the succeeding season, as well for what we have escaped, as for what we may enjoy; and every budding flower which a warm situation brings early to our view, is considered by us as a messenger to notify the approach of more joyous days.' Cowper says—

'That man, immured in cities, still retains
His inborn inextinguishable thirst
Of rural scenes, compensating his loss
By supplemental shifts, the best he may.
The most unfurnished with the means of life,
And they that never pass the brick-wall bounds,
To range the fields, and treat their lungs with air,
Yet feel the burning instinct; overhead
Suspend their crazy boxes, planted thick,
And watered duly. There the pithier stands,
A fragment, and the spoutless teapot there;
Sad witnesses how close-pent man regrets
The country, with what ardour he contrives
A peep at nature, when he can no more.'

The poet truly calls the love of nature—of flowers—a 'burning instinct'; for although, in many instances, it is stifled and concealed beneath the husk of gainful pursuits, yet in a thousand others it is a glad and beautiful source of enjoyment. The 'long green box of mignonette,' as described by Tennyson, cheers the lone dweller in many a close and gloomy alley; its odorous companionship recalling the memory of days passed where fields were green and skies were blue. The writer just quoted observes that

— 'the dull
See no divinity in grass.'

But all are not dull; and the verdant turf refreshes the eyes and soothes the feet of thousands, to whose last resting-places it will one day afford a perennial covering.

One of Tennyson's most beautiful poems, 'The May Queen,' contains a vivid manifestation of the influence of flowers. The dying girl laments—

'There's not a flower on all the hills; the frost is on the pane;
I only wish to live till the snowdrops come again;
I wish the snow would melt, and the sun come out on high;
I long to see a flower so before the day I die.'

Although not remarkable for extraordinary beauty, we think highly of the first flowers of the season, and prize them above some of the more gaudy varieties that come after: their early advent is, in fact, the only claim to notice of many that otherwise would be disregarded. Thus Wordsworth tells us of the celandine, that it

— 'comes
Like a careless prodigal;
Telling tales about the sun,
When we've little warmth, or none.'

In another place he observes—

'Birds, and butterflies, and flowers,
Make all one band of paramours.'

And elsewhere, in a beautifully philosophical and poetical spirit, declares—

'And 'tis my faith that every flower
Enjoys the air it breathes.'

According to an old writer, 'the cultivation of flowers is, of all the amusements of mankind, the one to be selected and approved as the most innocent in itself, and most perfectly devoid of injury or annoyance to others. The employment is not only conducive to health and peace of mind, but probably more goodwill has arisen, and friendships been founded, by the intercourse and communication connected with this pursuit, than from any other whatsoever. The pleasures, the ecstasies of the horticulturist, are harmless and pure; a streak, a tint, a shade, becomes his triumph, which, though often obtained by chance, are secured alone by morning care, by evening caution, and the vigilance of days: an employ which, in its various grades, excludes neither the opulent nor the indigent; and, teeming with boundless variety, affords an unceasing excitement to emulation, without contention or ill-will.'

Mrs Barbauld has some pleasing lines to the same effect:—

'Flowers, the sole luxury that nature knew,
In Eden's pure and guiltless garden grew.
To loftier forms are rougher tasks assigned;
The sheltering oak resists the stormy wind;
The tougher yew repels invading foes;
And the tall pine for future navies grows;
But this soft family, to cares unknown,
Were born for pleasure and delight alone.
Gay without toil, and lovely without art,
They spring to cheer the sense and glad the heart.'

Flowers have a language, natural and conventional: with the former, they announce the passage of seasons and the flight of hours; the latter is best understood in the sunny East. There the lover selects his floral messengers, and sends to his mistress a graceful compliment, an earnest assurance of constancy, a warning, or a doubt: a thousand emotions may be conveyed by the mute ministers, a thousand similes found in their forms and hues. With what grace Moore gives utterance to Nourmahal's impatient desire for a wreath in 'The Feast of Roses':—

'Anemones and seas of gold,
And new-blown lilies of the river,
And those sweet flow'rets, that unfold
Their buds on Camadeva's quiver;
The tube-rose, with her silvery light,
That in the gardens of Malay
Is called the mistress of the night,
So like a bride, scented and bright,
She comes out when the sun's away;
Amaranthus such as crown the maids
That wander through Zamara's shades;
And the white moon-flower, as it shows
On Serendib's high crags to those
Who near the isle at evening sail,
Scenting her clove-trees in the gale;
In short, all flow'rets and all plants,
From the divine Amrita tree,
That blesses Heaven's inhabitants
With fruits of immortality,
Down to the basil-tuft that waves
Its fragrant blossom over graves,
And to the humble rosemary,
Whose sweets so thanklessly are shed
To scent the desert and the dead.'

The pedestrian tourist, while wandering over the land in search of the picturesque in landscape scenery, or time-hallowed ruins, well knows the pleasure derived from the sight of flowers clustering round the springs, that, as they run—

— 'preach
A natural sermon o'er their pebbly beds.'

near a dusty road; fringing the little water-courses on some steep hill-side, or relieving the cool gloom of wooded alleys. The writer of the present article well remembers his first view of Scotland. He had walked through the wildest scenes of Northumberland, and after a halt on the fatal field of Chevy Chase, toiled up

the long ascent of the Carter Fell to the highest summit of the Cheviots. From this point the view is most impressive; hill upon hill stretching away for miles, until lost in the blue and distant mountains, and covered so thickly with heather and gowans, as to resemble broad rolling ocean waves of purple and gold. It was a sight, once seen, never to be forgotten; that left no doubt on the mind with respect to its influence as a source of poetic inspiration. It was no longer difficult to sympathise with Burns's enthusiasm on the subject of heather, or to appreciate the beauty of such lines as those by Mrs Grant:—

'Flower of the wild! whose purple glow
Adorns the dusky mountain side,
Not the gay hues of Iris' bow,
Nor garden's artful varied pride,
With all its wealth of sweets could cheer,
Like thee, the hardy mountaineer.'

And Scott, describing Marmion's prospect from Blackford Hill:—

'On Ochil mountains fell the rays,
And as each heathy top they kissed,
It gleamed a purple amethyst.'

Scott is known to have painted from the life: he did not introduce flowers for mere effect, unless they were to be found in the localities he described. The scene on the shores of Loch Katrine afforded free scope to his pen:—

'Boon nature scattered, free and wild,
Each plant or flower, the mountain's child;
Here eglantine embalm'd the air,
Hawthorn and hazel mingled there;
The primrose pale and violet flower,
Found in each cliff a narrow bower;
Foxglove and nightshade, side by side,
Emblems of punishment and pride.'

Dreary, indeed, is the land to which nature has denied flowers: the arid deserts of the torrid zone are not altogether deprived of their presence; and even amid the ice and snow of the polar regions, we find them struggling into existence—asserting, as it were, their right to beautify and adorn, though ever so humbly. The fuchsia and clematis grow in abundance in the forests of New Zealand; with the latter, the native girls braid their hair on festive occasions. The gorgeousness of flowers in tropical climates is scarcely to be imagined by the inhabitants of countries farther from the sun. The rock lily of New South Wales grows to a height of thirty feet, crowned by a profusion of brilliant scarlet flowers. How different this from the

— 'fair lily, faint with weeping,
Upon a bed of violets sleeping!'

Or the water lily, as described by Mrs Hemans—

'Oh! beautiful thou art,
Thou sculpture-like and stately river queen,
Crowning the depths as with the light serene
Of a pure heart.
Bright lily of the wave!
Rising in fearless grace with every swell,
Thou seem'st as if a spirit meekly brave
Dwelt in thy cell.'

Shelley also has sung of the lily in musical verse: growing in the garden with the sensitive plant and other flowers was—

— 'the maid-like lily of the vale,
Whom youth makes so fair, and passion so pale,
That the light of its tremulous bells is seen
Through their pavilions of tender green.'

Hood, who in some of his lyrics so much resembles the moral teachings of Herrick, says—

'The lily is all in white, like a saint,
And so is no mate for me;
And the daisy's cheek is tipped with a blush,
She is of such low degree.
Jasmine is sweet, and has many loves,
And the broom's betrothed to the bee;
But I will plight with the dainty rose,
For fairest of all is she.'

And with what a Shakespearean spirit and beauty does

he represent the fairies supplicating grim Saturn to spare their lives, urging their attentions to

'The widowed primrose weeping to the moon,
And saffron crocus, in whose chalice bright
A cool libation, hoarded for the moon,
Is kept; and she that purifies the light,
The virgin lily, faithful to her white,
Whereon Eve wept in Eden for her shame;
And the most dainty rose, Aurora's spright,
Our every godchild, by whatever name—
Spare us our lives, for we did nurse the same!'

Of all the poets, Keats appears to be the most imbued with the *floral feeling*: flowers are so exquisitely blended with his subjects, that it seems like sacrilege to disturb their harmonious proportions by the singling out of fragments. 'The poetry of earth,' he tells us, 'is never dead.'

— 'I was light-hearted,
And many pleasures to my vision started;
So I straightway began to pluck a posy
Of luxuries bright, milky, soft, and rosy.
A bush of May-flowers with the bees about them;
Ah! sure no tasteful nook could be without them!
And let a lush laburnum oversweep them,
And let long grass grow round their roots, to keep them
Moist, cool, and green; and shade the violets,
That they may bind the moss in leafy nets.'

Lilies have always been considered as emblematic of purity and humility. Ben Jonson says delicately of one of his characters, that she

— 'looks as lilies do,
That were this morning blown.'

And a living authoress, Mrs Robert Browning, writes in one of her sonnets, 'a thought lay like a flower upon mine heart;' an expression of as much truth as beauty. In another place she introduces to our notice

— 'lilies white, prepared to touch
The whitest thought, nor soil it much;'

and elsewhere sets before us the following 'Lesson from the Gorse':—

'Mountain blossoms, shining blossoms!
Do ye teach us to be glad
When no summer can be had,
Blooming in our inward bosoms?
Ye, whom God preserveth still,
Set as lights upon a hill,
Tokens to the wintry earth, that beauty liveth still!'

Her lament of the flower-spirits on the banishment of Adam and Eve from the garden of Eden, is a most harmonious strain of mournful music:—

'We linger, we linger,
The last of the throng!
Like the tones of a singer
Who loves his own song.
We are spirit-aromas
Of blossom and bloom;
We call your thoughts home, as
Ye breathe our perfume;
To the amaranth's splendour
Affire on the slopes;
To the lily-bells tender,
And gray heliotropes!
* * *
To the rose in the bower-place,
That dripped o'er you sleeping;
To the asphodel flower-place,
Ye walked ankle-deep in!
We pluck at your raiment,
We stroke down your hair,
We faint in our lament,
And pine into air.'

It would be easy to fill a volume with all that poets have written concerning flowers; the harvest is, in fact, so abundant, as to render the task of selection one of some difficulty. Flowers are associated with the loftiest and with the humblest names: for the roses to decorate a single supper, Cleopatra paid £200. Such was the lavishness with which the Romans indulged their taste for flowers, that sumptuary laws were enacted to restrain it. Verres, when governor of Sicily, made the tour of the island reclining on a couch of roses, shaded by festoons of choicer flowers. The horticultural history of a people would perhaps form an interesting in-

dex to their civil and political history. Herbs and the commoner flowers would be at first in request; but with increase of wealth, and acquisitions of conquest, costly exotics were cultivated, and nature distorted to suit the freaks of fashion. There is much in the history of the past to make us say with the poet—

'Despise not thou the wildflower! Small it seems,
And of neglected growth, and its light bells
Hang carelessly on every passing gale:
Yet it is finely wrought, and colours there
Might shame the Tyrian purple; and it bears
Marks of a care eternal and divine.
Duly the dews descend to give it food;
The sun revives it drooping, and the showers
Add to its beauty; and the airs of heaven
Are round it for delight.'

MR MILNE ON THE POTATO FAILURE.

MR MILNE is known for his scientific papers, in which we usually find general conclusions arrived at by induction from a great collection of facts. Having turned his attention to the investigation of the Potato Failure of the two last seasons, we are here furnished with a set of observations on the subject, drawn up in the author's usual lucid and painstaking manner.* We learn that the theory of the disease having been produced by insects is inadmissible, because it showed itself before there was any appearance of insects. *Fungi* must equally be rejected, for those in the tubers were of different species from those in the leaves: such vegetation appears to have been a result, not the cause, of the disease. The evil could not spring from any over-cultivation of the plant, for specimens brought directly from Peru were affected equally as others. It could not be because the plant has come to the close of its existence as a species, seeing that the disease attacked many other plants, as pease, cabbage, tansy, spinach, and even elms and oaks. Then the weather, the temperature, rains, are all in like manner discarded, because, from a vast amount of evidence collected by Mr Milne, it appears that the disease was irrespective of all such conditions. The weather of 1845 and 1846 appears to have been noway extraordinary, and in the latter year vegetation was everywhere abundant till the time when the potato disease began to show itself.

Mr Milne arrives at the conclusion that the cause was atmospheric, and he deems it probable that the evil lay in some deleterious substance diffused through the air at the time of the disease. There are facts, he thinks, even to show to a certain extent the properties of this substance. 'In the first place, it is a substance, the injurious effects of which have been prevented by screens, shelter, and other modes of protection.' In several cases glass frames placed over the plants saved them from the disease, while other plants close by were destroyed. There were several instances of the crops of indolent farmers being saved, while those of careful farmers suffered; and this could be attributed to no other cause than that the potatoes, in the former set of cases, were screened by the weeds which had been suffered to grow over them. In a field which had potatoes sown with barley, 'several of the ungathered tubers had grown in the corn, and not a single plant of these was even in the slightest degree diseased.' Mr Colin Campbell's overseer at Craignish states, that 'potatoes planted on the farm with different manures, and on various soils, were alike tainted. I, however, observed, that when they were sheltered by a stone wall or trees, or when overgrown with weeds, they were not diseased, and have continued sound.' Such experiences are reported from so many other quarters, that Mr Milne regards it as established, that potatoes were saved 'where screened from the external air, or rather

from the blowing on them of the external air.' 'The effects,' he says, 'seem analogous to what occurs to vegetation near the sea-shore, where it is much exposed. It is of course not the oxygen or nitrogen of the atmosphere which, on the sea-coast, produces an injury to vegetation not produced elsewhere; nor is it the mere cold, because places at a high level inland are exposed to more cold than at the sea level, and yet show none of the peculiar effects on vegetation observable on the sea-shore. There must, therefore, be some particular substance or substances in the sea air to blight the leaves of trees and plants, unless sheltered. These may either be the salts of the sea-water, which are always floating in greater or less abundance upon the winds that come from the sea, and which, being arrested and absorbed by the leaves, may cause their blight and death; or it may arise from the presence of chlorine gas, supposed to be liberated, under certain circumstances, from the chloride of magnesium, which exists in sea-water; and which gas is known by direct experiment to be exceedingly injurious to vegetation. I do not say that chlorine gas, or the saline vapour of sea-water, are the substances which proved injurious to the potato crops; I refer to them merely in illustration of the principle, that when vegetables are injured by the blowing of air, and in circumstances when the mere air would produce, by blowing, no injurious effects, it is probable that there must be some other substance than the ordinary elements of the atmosphere to cause these effects.'

Mr Milne adduces another set of facts, showing that the disease travelled from the south-west to the north-east, taking three months to go from the south of Ireland to the Orkneys. He quotes a correspondent of the *Gardeners' Chronicle*, who tells that his potatoes were affected first on the south-west side of the plants. There is also a curious fact reported by an Aberdeenshire gentleman. Two fields under his observation were affected partially; in the one case, by lines of blight athwart the field; in the other, by the blight of one side, leaving the rest sound; and the direction of the blight in these cases was from south-east to north-west. For some time before, the weather had been very sultry, 'with a light fog or haze travelling very slowly over the surface of the earth, from the south-east to the north-west.' Supposing a deleterious substance carried by the wind, it readily occurs, says Mr Milne, that any obstruction, such as trees and other prominent objects, might turn it aside from particular portions of the surface.

Mr Milne then proceeds to remark, that the crops near the Welsh copper-works were comparatively exempt from the disease, the more so the nearer to the works, although the smoke of the furnaces is generally unfavourable to vegetation. There was also less experience of the disease in situations close upon the sea-shore than in inland places. A crop reared on land newly reclaimed from the sea, and out of which no means had been taken to wash the salt, was a luxuriant one. It was also remarked that potatoes manured with soot and guano (substances containing much ammonia) were comparatively sound. 'From these various facts,' says our author, 'I infer that the substance in the atmosphere which injured the potato crops was some acrid gas or vapour, capable of being neutralised or altered in its nature by chlorine, common smoke, and the fumes of arsenious and sulphurous acids.'

The question arises, Were there any unusual appearances in the atmosphere about the time of the potato failure? It appears, according to Mr Milne, that there were. Extensive and very peculiar fogs prevailed, accompanied by much thunder and lightning. A gentleman in Yorkshire reports that about the 25th August there was one night a dense fog, attended by extreme heat, and the next morning the potato fields had precisely the disorganised appearance they have after a night's frost. They soon became black, and the disease followed in a few days. An Orkney farmer

* Observations on the Probable Cause of the Failure of the Potato Crop in the years 1845 and 1846. By David Milne, Esq. Edinburgh: William Blackwood and Sons. 1847.

'observed a very dense fog resting in patches on certain parts of the island; at times it was so defined, that he could point out the exact measure of ground over which it rested. It hung low over the ground, and had the appearance of a light powdering of snow. In passing, it fell down on his small farm, and he *smelt it very unpleasant*; exactly like, he says, the bilge water of a ship, a sulphurous sort of stench. After the wind rose and cleared off those clouds or lumps of fog, there remained on the grass over which they had hung, as well as on the potato shaws, an appearance of gray dew or hoar-frost. The next morning he noticed the leaves of his potatoes slightly spotted. In two days the shaws began to droop and wither, turning pale-yellowish. He now observed that the tubers in the ground, under the diseased plants, were covered by minute white specks, which soon became small maggots; and before ten days, not a shaw was in his potato patch, more than if it had been a bare fallow, while the stench of the rotten potatoes was very bad. This was one of the spots where the fog bank had rested most palpably. But everywhere through the island, the disease, after the fog, began in spots and corners of fields, and spread more slowly over all.'

After quoting other observers of the fogs, Mr Milne remarks that there was something extraordinary in them. 'In the first place, they appeared at an anomalous season of the year—that is, at a period when the temperature of the air generally exceeds that of the earth and water. In the second place, they continued for longer periods than they usually do, even in spring. In the third place, some persons were sensible of a peculiar odour or smell accompanying them.' He adds—'In regard to the connection of these fogs with the potato disease, it certainly does not follow, because two extraordinary things happen simultaneously, or closely in succession, that they are connected. But the probability of their being so, is enhanced by the considerations formerly submitted, as to the existence of some extraordinary substance in the air which must have produced the disease; and the presumption is further strengthened by the fact, that in 1845, when there was no failure of potato crops in the Highlands and the Orkneys, there were no fogs; whilst in 1846 there was a universal failure, and simultaneously with the disease, the prevalence of peculiar fogs in the Highlands.'

In the latter part of his pamphlet, Mr Milne shows how small an infusion of deleterious matter in the atmosphere is sufficient to injure vegetation. He also remarks the unusual mortality of both man and beast during the last two years as probably connected with the same cause. While, he says, it is for experienced chemists to ascertain the nature of the substance which seems to have produced the potato failure, he may observe that 'the gases which apparently neutralise it, or counteract its noxious effects, are all those which are remarkable for their antiseptic properties, and some of which are commonly used to stop contagion. Dr Ure observes, that "malaria, or morbid and putrescent miasmata, consist chiefly of hydrogenous matter as their basis, and are best counteracted by chlorine." Liebig, in his "Chemistry and Physics in Relation to Physiology," p. 53, says, that "free or combined ammonia, the almost invariable product of putrefactive processes, is found, during many contagious diseases—as, for instance, typhus—in the surrounding atmosphere;" and we know that ammonia may be decomposed by chlorine (Ure's "Dictionary of Arts"). In like manner it is known that sulphurous and arsenious acids are pre-eminently useful in counteracting putrefaction (Liebig, do. p. 50). It may, therefore, be inferred, that the substance in the air which these several gases neutralised was similar to what, under the convenient name of miasm, is found to be injurious to the vitality of plants and animals. The true nature of miasmata, though guessed at by chemists, has never been ascertained. But it is believed that, like the exhalations from marshes, and the

pollen and odoriferous dust from flowers, they are, as Dr Graham says, "highly-organised particles of fixed matter, which find their way into the atmosphere, and remain for a time suspended in it," and when so suspended, they can be dissolved and neutralised by gases of the nature before described.'

Should additional investigation settle the question in this manner, may we not hope to see, among the arrangements of agriculture, apparatus for neutralising such infusions of noxious matter, when they happen to arise?

THE STRANGER OF THE BALL.

A BALL was about to take place in a small country town on the west coast of Scotland, and as the town boasted only one barber of any eminence, it may be supposed that his hands were full. Indeed Duncan could not by any possibility have got through his business, had it not luckily happened that he had just provided himself with an assistant. The assistant was from London; though only from an 'establishment' in a lane leading out of Goswell Street. No matter: he was from London; and the fact was a tower of strength to the concern. The young man was a smart, vain, ignorant, impudent Cockney; and on finding himself all on a sudden in such wonderful demand, he gave himself a thousand ridiculous airs, at which even the anxious and expectant fair ones could not refrain from laughing.

At the period referred to, it must be told—the time when our respected grandmothers were young ladies—a ball could not by any possibility be got up without the assistance of the hairdresser. He was the *primum mobile* of the whole affair. The toes in those days were as nothing compared with the head; and the preparation of the latter for the scene was a task which could only be entrusted to the hands of a professional artist. We might wonder how it was possible for one pair of hands, even when assisted by another pair, to dress the hair of a whole townful of ladies—if we were not aware of the heroic endurance of the fair sex in extraordinary exigencies. The fact is, the labours of the barber began at daybreak on the morning of the day before that of the ball; and those who were obliged to submit to the operation on that day, rather than put in jeopardy, by lying down, the edifice he had constructed of dust, grease, and hair, sat up all night in a chair.

In the town in question, a certain young lady—not our grandmother, we beg to say—was on the present occasion one of these victims: but a very unwilling one. On the first intelligence reaching her of the day for the ball being fixed, she had hastened to the spot from a place at some distance where she had been on a visit; but railways, unluckily, not having as yet been invented, she did not arrive till Duncan was engaged, body and soul, for every minute of the actual day, up to the very tuning of the fiddles. Now Miss Bella, though an angel in beauty, was the very opposite in temper. She was proud, arrogant, and imperious; and this unfortunate casualty, though charged in the first instance upon the barber exclusively, seemed at length to be the effect of nothing less than a conspiracy of the whole population. But it was needless to fret or fume. The barber could not, and the other young ladies would not, give way; and at length Miss Bella was constrained to take her place among the penultimates.

This was an unhappy occurrence for the Cockney, who, for his sins, was doomed to dress the spoiled beauty's hair. She was not at any time very condescending to her inferiors in station; but on the present occasion she discharged all the vials of her pride upon the unfortunate young man, till she nearly set him crazy, vanity and all. Her temper, it may be supposed, was not improved by her being obliged to sit up the whole of the night as motionless as a wax doll: but, sustained by the heroism of her sex, she did come through the trial; and as on the next day the hours wore on towards the evening, a wild and feverish gaiety

gradually took the place of her ill-humour. She at length found herself in the ball-room, blazing with beauty, with a pyramid of hair such as Goswell Street had never seen in this world, and her sufferings were entirely forgotten. It was remarked that Miss Bella never looked so handsome, and never moved so gracefully: but some of her own sex discovered a dash of scorn in her gaiety, which detracted, they said, from the effect of her beauty; and others declared that there was something strangely flighty in the movements both of her limbs and eyes. Perhaps all this arose from envy.

But, unluckily, the grand element in the success of a ball was wanting: there was no adequate number of dancing men. The few as yet present were her discarded swains—for she had refused half the bachelors in the town; and these, either in spleen or mortification, kept out of her way. By and by all her own party had been led out; and Miss Bella was exposed to the frequent interrogatories of her affectionate friends—'Why don't you dance?' Still she was not cast down. Her cheeks glowed, her eyes blazed, and she met such impertinent questions with a haughty smile.

'Why don't you dance, Bella? Don't you mean to dance to-night?' said her good-natured companions, gathering round her.

'Yes,' replied Bella, turning to them with a gay fierceness—'I will dance to-night, if my partner should be the—'

How she meant to have finished the sentence, no one can exactly tell: but there was a gleam in her eye while she spoke which frightened her audience, and they drew back with a faint scream. In drawing back, some of them nearly trod on the toes of a gentleman who had just entered the room: at least no one had observed him till that instant. He was a young and handsome man, with the most exuberant curls and whiskers in the world, of a jetty blackness, and contrasting strangely with the waxen colour of his cheek. The eyes of the stranger, for no one in the room knew him, were fixed admiringly upon the beautiful Bella; and walking straight up to her, he asked her to dance. He had not been presented to her; she did not know his name; and yet—with an obliviousness of conventional rule quite foreign to her character—she at once accepted his arm, and in another moment they were whirling together through the dance.

This incident occasioned much conversation. Miss Bella and her partner were decidedly the handsomest couple in the room; and they continued dancing together half the evening. Who was he? From appearances, 'military' seemed most likely; yet not one of the officers of the neighbouring garrison knew him. He was not a resident in the town: it was ascertained that he had not bespoken a bed at either of the inns: he had no horse nor equipage. How did he come? How did he mean to go? The mystery appeared unfathomable; and when at length Bella's uncle made his appearance, at a late hour in the evening, many of the company gathered round him, to tell eagerly how his niece had been dancing so long with an utter stranger, and to advise him at least to ascertain the gentleman's name.

The uncle thought the proud and high-spirited Bella might very well be left to herself in a case of the kind; but still he could hardly avoid taking some notice of the affair. The couple were at this time standing near the door, with several others, to enjoy the cool air; and as they saw the eyes of so many of the company directed towards them, Bella, with perhaps some feeling of awkwardness, as she recollected her imprudence, turned away from her partner.

'Niece,' said the old gentleman, going up to her, 'I shall request the pleasure of being introduced to the gentleman you have danced with.'

'I did not catch his name,' replied Bella; 'the master of the ceremonies will doubtless do what is necessary, unless the gentleman himself—where is he?'

'Where is he?' repeated the uncle.

'Where is he?' echoed the rest of the company. The gentleman had disappeared.

This is a simple statement of the affair as it really happened; but it is hardly necessary to say that a thousand circumstances were added to it by rumour, till at length it was reported and believed that Bella, in despair of a partner, had summoned a certain very old young gentleman to dance with her, who had come at her bidding, and at length vanished in smoke. Even without these adjuncts, however, the thing was mysterious enough; and the proud girl found herself subjected to so many taunts, that she hardly stirred out of her house for some time after the ball.

At length another wonder occurred, to arouse anew the attention of the town. This was the sudden disappearance of the Cockney barber, Duncan, when questioned on the subject, was very close and mysterious; and he was likewise averse to holding frank communication touching the absence, discovered at the same moment, of the plantation of jet-black curls and whiskers of a waxen bust in his shop-window. These were now currently said to bear an astonishing resemblance to the decorations of the stranger of the ball!—and, proceeding from one impertinence to another, Miss Bella was at length complimented with the title of 'The Barber's Bride.' Some old ladies, however, were still disposed to adhere to the supernatural theory; for how otherwise was it possible to account for the change which took place in the haughty beauty? Miss Bella became, from that day, an absolute personification of meekness and gentleness; and acquiring a perfect horror of the vanities of fashion, ever afterwards appeared in a plain crop of curls!

THE INTERIOR OF AUSTRALIA.

The old and new worlds are almost tired of this new world of the Pacific, where only the sea-coasts, we have been told, are fit for human settlement, while the interior, for a space of at least thirty degrees of longitude, is a series of deserts, watered by lakes that turn periodically into swamps, and rivers that lessen as they run, till they finally sink in the earth, and disappear. Such, at least, has been the experience of Captain Sturt, who, in the midst of unparalleled difficulties, endeavoured, and is still endeavouring, to intersect the vast country from south to north, from Adelaide to the Gulf of Carpentaria. The mighty river, or inland sea, which was the object of his quest, and in the existence of which he entertained a firm belief, receded as he advanced; and when last heard of, he had accomplished two-thirds of his journey, arriving at some degrees beyond the tropic of Capricorn, with still nothing more than Hope in the distance.

But while this is the case in the very middle of the new continent, great discoveries are taking place to the eastward, midway between Captain Sturt's line of route and the distant shores of the South Pacific. There Sir Thomas Mitchell, it appears, has wandered by the banks of noble rivers—one of which he believes to have its estuary in the Gulf of Carpentaria—and in the midst of plains as rich, and hills as picturesque and romantic, as any that are to be found on the most beautiful part of the coast. The world has been too impatient. Australia will yet realise its earlier dreams, and become the site of great empires. Even the central wastes may yield to human industry, as population closes in upon them from all sides of the compass.

But pleasant as such anticipations may be, they are somewhat vague and shadowy. This is truly affirmed to be a practical age; which means that we work much, and speculate little. Progress, progress, is our grand object. Another generation will perhaps ascend the hill-tops, to observe the course of the country through which they are journeying, but it is our genius to push blindly, untiringly on. Let us in the meantime, therefore, follow Sir Thomas Mitchell, without burthening ourselves with the task of posterity.

The letters of the surveyor-general, as given in substance in the 'Launceston Examiner,' are not so precise as could be wished; indeed it is hardly possible to obtain from them any distinct idea of the system of rivers he attempts to describe. After the junction of the Macquarie with the Darling, he visited the Narran Swamp, 'a wonderful provision of nature for the supply and retention of water in a dry and parched country.' It appears to be fed chiefly by the Narran River, but also by minor branches of the Balonne, which discharges its main waters into the Darling. This division of so important a river as the latter is likewise advantageous, as it serves to irrigate 'from one principal channel extensive regions of rich earth beyond the Darling, while the surplus or overflow, instead of passing, as in common cases, to the sea, is received in the deep channel of the Narran, and thereby conducted to that extensive reservoir, where, on rock or stiff clay, and under ever-verdant polygonum, it furnishes an inexhaustible supply for the support of animal life.'

Proceeding beyond the farthest point marked in the maps, he traced the Balonne flowing in broad, deep, and extensive reaches. 'From Mount Abundance,' he says, 'in longitude 148° 40' east, latitude 26° 39' 30" south, I again perceived that the fine open country in which I then was extended eastward as far as the eye or telescope could reach, and that it was watered by a river from the northward, distinctly marked by the smoke of the natives' fires. That river was still the Balonne, according to the natives; and from Mount Bindango I was able to intersect the summits of the isolated range in the centre of that splendid region, placing it in longitude about 149° 2' east, and in latitude 26° 23' 32" south. To mark the epoch of this discovery, I named it on my map the Fitzroy Downs, and the range in the midst of them I distinguish as the Grafton Range.'

He next came upon the river Maranoa; which was subsequently discovered by Mr Kennedy to join the Balonne. Its banks were of rich pastoral land, of the nature of open downs.

'Continuing my ride north-west, I again found a chain of volcanic summits connected with a mass of table-land, which I named—finding none of the aborigines there—Hope's Table-Land. Mount P. P. King, a pointed volcanic cone, longitude 147° 37' 40" east, latitude 25° 9' 10", is near the head of that river, which we followed down until it turned, as all the others had done, to the south-west. I reached an extensive grassy valley, which terminated on a reedy lake in a more open country. The lake was supplied by springs, arising in a swamp at the gorge of the valley, which supported a flowing stream of the purest water. The country is adorned by hills of the most romantic form, presenting outlines which surpass in picturesque beauty the fairest creations of the painter. Several pyramids mark the spot where the springs were first discovered, and whence I now write. Lower down appear over the woods isolated rocks, resembling ruined castles, temples, and Gothic cathedrals. Others have apertures through them; and the trees being also very varied and graceful in form, and rich in colour, contribute so much to the beauty of the scenery, that I have been induced to distinguish river and lake by the name of a painter. We lost two days in vainly endeavouring to pass to the westward, through dense brigalow scrub; but on a ride I took north-westward, I was more successful, for after forcing my way through ten miles of scrub, I came to what seemed to me the finest region on earth: plains and downs of rich black mould, on which grew in profusion the *Panicum laevinode* grass, and which were finely interspersed with lines of wood, which grew in the hollows, and marked the courses of streams: columns of smoke showed that the country was too good to be left uninhabited; and, in fact, on approaching the nearest river channel, I found it full of water. This river I named Claude, in honour of the painter of quiet pastoral scenery; and to the downs and plains, so favourable to flocks and herds, I gave the name of the

Mantua Downs and Plains. I returned to the party on the Salvator, crossed that river with it in latitude 24° 31' 47" south, and conducted it, cutting our way through ten miles of scrub, to the banks of the Claude. These two rivers join at a considerable distance lower down, and form the Negroa; a river which, according to the natives, pursues a north-east course to the sea, and therefore probably has its estuary on the shores of Broad Sound or its vicinity.

'We were obliged to make a bridge for the passage of our carts across the Claude, and then we crossed a plain upon which grass grew almost as thickly as it grew in Australia Felix; then another stream, also full of water, was crossed, and we ascended undulating downs, on which fragments of fossil wood were abundant in a very rich soil. Beyond these—the Mantua Downs—a range of broken summits appeared, and was certainly ornamental, but which we found to be only the upper part of a very intricate and difficult sandstone country, wherein the beds of the gullies were at a much lower level than the downs and plains. I endeavoured to penetrate to the westward of these, but found the country on that side quite impervious. We found a very favourable outlet from that difficult country by a pass, in the gorge of which stood a rock so much resembling a tower, that at first sight few would believe it the work of nature only. The glen we then entered (named from the tower at its entrance, Glen Turret) was very extensive, and contained abundance of good grass.'

All this, however, was of little consequence to the object of the surveyor—the discovery of a great river flowing towards the Gulf of Carpentaria; but in a letter from the Balonne, dated November 9, 1846, we have at length some hint of the consummation so much desired. His first view of what he fondly imagines to be the river, was in longitude 146° 42' 25" east, latitude 24° 50' 35" south.

'On ascending the range early next morning, I saw open downs and plains with a line of river in the midst, the whole extending to the north-north-west as far as the horizon. Following the little stream from the valley in which I had passed the night, I soon reached the open country, and during ten successive days I pursued the course of that river, through the same sort of country, each day as far as my horse could carry me, and in the same direction, again approaching the Tropic of Capricorn. In some parts the river formed splendid reaches, as broad and important as the river Murray; in others, it spread into four or five channels, some of them several miles apart; but the whole country is better watered than any other portion of Australia I have seen, by numerous tributaries arising in the downs. The soil consists of rich clay, and the hollows give birth to water-courses, in the most of which water was abundant. I found at length that I might travel in any direction, and find water at hand, without having to seek the river, except when I wished to ascertain its general course, and observe its character. The grass consists of panicum and several new sorts, one of which springs green from the old stem. The plains were verdant; indeed the luxuriant pasturage surpassed in quality, as it did in extent, anything of the kind I had ever seen. The myall-tree and salt bush (*Acacia pendula* and *salicola*), so essential to a good run, are also there. New birds and new plants marked this out as an essentially different region from any I had previously explored; and although I could not follow the river throughout its long course at that advanced season, I was convinced that its estuary was in the Gulf of Carpentaria; at all events, the country is open and well-watered for a direct route thereto. That the river is the most important of Australia, increasing as it does by successive tributaries, and not a mere product of distant ranges, admits of no dispute; and the downs and plains of Central Australia, through which it flows, seem sufficient to supply the whole world with animal food. I crossed the river at the lowest point I reached,

in a great southern bend, in longitude 144° 34' east, latitude 24° 14' south, and from rising ground beyond the left bank, I could trace its downward course far to the northward. I saw no *callitris* (pine of the colonists) in all that country; but a range showing sandstone cliffs appeared to the southward, in longitude about 145° east, latitude 24° 30' south. The country to the northward of the river is, upon the whole, the best; yet in riding ninety miles due east from where I crossed the southern bend, I found plenty of water and excellent grass.

The other rivers surveyed—in number, seven—were all of considerable importance; and Sir Thomas believed that an investigation of the mountain-ranges in which they originate would enable him to construct 'such a map of those parts of Australia, as may greatly facilitate the immediate and permanent occupation of the country, and the extension through it of a thoroughfare to the Gulf of Carpentaria, to which the direct way is thus laid open.' He named the great river, 'watering the best portion of the largest island in the world,' the Victoria.

To the Gulf of Carpentaria we must look for the solution of the mystery of Australia. This mighty basin, at the extreme north of the new continent, is the receptacle of so vast a body of water, that the Indian voyagers are said to be able to fill their casks with fresh water when as yet the low land is barely visible from the deck. The head of the gulf consists of an expanse of alluvial soil, covered with luxuriant herbage, and stretching inland to an unascertained extent, which has been appropriately named by Captain Stokes 'Plains of Promise.' 'Whether the rivers, or rather water-courses, discovered here by the Beagle,' says Mr Earl, 'are independent channels, or the embouchures of one large river which carries off the waters of a great extent of country, and which, like the mouths of the Indus, become partially closed during the dry season, is a point of the deepest interest, and which will probably not long remain undetermined.' The same acute observer adds, as a proof of the rapidity with which the land is gaining on the sea, that it has outstripped in its advance even the progress of tropical Australian vegetation, 'the period that has elapsed since its elevation above the level of the waters not having been sufficient to allow the forest-trees to overspread the face of the country.'

Whether the Victoria River, the discovery of which is reported above, will prove to be the grand Australian stream or not, it is as yet impossible to say; but it is at least satisfactory to know that we have advanced so far in the question as to render much longer delay in its solution improbable.

THE CHEAPEST BREAD YET.

We have been favoured by Mr S. Brown, of Finedon, near Higham Ferrers, with a sample of bread, which he states is in constant use on his farm. It is made of flour and mangel wurzel, in equal quantities, by weight. The mangel wurzel is pared, cut into slices, and boiled so as to mash well. The usual quantity of yeast must be used, and little or no water is required. It must stand some time after mixing, and then be baked as other bread. If the loaf sent to us be a fair sample, we should call it good household bread. The saving to families would be very great, the price of mangel wurzel being only a farthing a pound. Fifty per cent. at least would be saved by the use of this bread.—*Newspaper paragraph.*

THE TRUE ELIXIR VITÆ.

Joy is one of the greatest panaceas of life. No joy is more healthful or better calculated to prolong life than that which is to be found in domestic happiness, in the company of cheerful and good men, and in contemplating with delight the beauties of nature. A day spent in the country, under a serene sky, amidst a circle of agreeable friends, is certainly a more positive means of prolonging life than all the vital elixirs in the world. Laughter, that external expression of joy, must not here be omitted. It

is the most salutary of all the bodily movements; for it agitates both the body and the soul at the same time; promotes digestion, circulation, and perspiration, and enlivens the vital power in every organ.—*Hufeland.*

BUSINESS AND LEARNING.

If any man maintaineth that learning takes up too much time, which might otherwise be better employed, I answer, that no man can be so straitened and oppressed with business, and an active course of life, but may have many vacant times of leisure, while he expects the returns and tides of business, except he be either of a very dull temper, and no despatch, or ambitious (little to his credit and reputation) to meddle and engage himself in employment of all natures and matters above his reach. It remaineth, therefore, to be inquired, in what matter and how those spaces and times of leisure should be filled up and spent; whether in pleasures or study, sensuality or contemplation; as was well answered by Demosthenes to Æschines, a man given to pleasure, when he told him, by way of reproach, that his orations did smell of the lamp, 'Indeed,' said Demosthenes, 'there is a great difference between the things that you and I do by lamplight.' Wherefore, let no man fear lost learning should expulse business; nay, rather, it will keep and defend the possessions of the mind against idleness and pleasure, which otherwise, at unawares, may enter to the prejudice both of business and learning.—*Bacon.*

PUBLIC CHARITIES.

The general principles by which men are actuated who bequeath fortunes to public charities are *fear* and *vanity* more than benevolence, or the love of doing good, which will appear from the following considerations:—1st, If a man were possessed of real benevolence, and had (as he must then have) a delight in doing good, he would no more defer the enjoyment of this satisfaction to his death-bed, than the ambitious, the luxurious, or the vain, would wait till that period for the gratification of their several passions. 2dly, If the legacy be, as it often is, the first charitable donation of any consequence, it is scarcely possible to arise from benevolence; for he who hath no compassion for the distresses of his neighbours whom he hath seen, how should he have any pity for the wants of posterity. 3dly, If the legacy be, as is likewise very common, to the injury of his family, or to the disappointment of his own friends in want, this is a certain proof that his motive is not benevolence; for he who loves not his own friends and relations, most certainly loves no other person. Lastly, if a man hath lived any time in the world, he must observe such horrid and notorious abuses of all public charity, that he must be convinced (with a very few exceptions) that he will do no manner of good by contributing to them.—*Fielding.*

REVERENCE FOR TRUTH.

The virtue of the ancient Athenians is very remarkable in the case of Euripides. This great tragic poet, though famous for the morality of his plays, had introduced a person who, being reminded of an oath he had taken, replied, *I incur with my mouth, but not with my heart.* The impiety of this sentiment set the audience in an uproar, made Socrates (though an intimate friend of the poet) go out of the theatre with indignation, and gave so great offence, that Euripides was publicly accused, and brought upon his trial, as one who had suggested an evasion of what they thought the most holy and indissoluble bond of human society. So jealous were these virtuous heathens of even the smallest hint that might open a way to perjury.—*Addison.*

CONTROVERSY.

I never loved those salamanders that are never well but when they are in the fire of contention. I will rather suffer a thousand wrongs than offer one: I will suffer a hundred rather than return one; I will suffer many ere I will complain of one, and endeavour to right it by contending. I have ever found, that to strive with my superior, is furious; with my equal, doubtful; with my inferior, sordid and base; with any, full of unquietness.—*Bishop Hall.*

THE DICTATOR; OR TWO SCENES IN PARAGUAY.

SCENE THE FIRST.

IN the vicinity of the city of Assumption, the capital of Paraguay (that irregular country, which, from the policy of seclusion so long pursued by its government, has been termed the Japan of South America), are scattered many country-houses belonging to the more wealthy citizens, who retire thither when their business is over, to escape from the scorching heat and stifling dust of the open, unpaved streets. To many of these villas farms or plantations of considerable extent are attached, which, cultivated by servants, supply the market of the capital, and thus afford a revenue to the proprietors. It is to one of these mansions that we would transport the imagination of our readers; and as this power—namely, the imagination—is lord of time as well as of space, we shall expect it to bear us company as far back as a period of forty years ago, when Paraguay was under the sway of a Spanish governor appointed by the viceroy of Buenos Ayres. At that time there stood, about a league north of the little city of Assumption, a dwelling of small dimensions—in fact a mere cottage—but beautifully situated, and surrounded by fields of sugar-cane, maize, tobacco, and cotton, all in full cultivation. The house was built, after the fashion of the country, of sun-dried bricks, covered with plaster, and whitewashed. Along the front was a deep veranda, the pillars of which were slender stems of forest trees, stripped of their branches and bark, and whitewashed, but with many rough knots and inequalities where the boughs had been hewn off. These served to sustain the vines which, planted at their feet, ascended with many a winding clasp, and covered them with their luxuriant leaves. Then, reaching the roof of the veranda, the vines spread and interlaced, until the whole was buried in a mass of verdant foliage, which contrasted beautifully with the snow-white walls of the cottage and the ruddy tiles of the sloping eaves. In the rear of the cottage was a long, low building, appropriated to the servants and the offices, and extending to a corral, or enclosure, in which the cattle and horses were kept. Directly in front of the porch were two tall trees, of the tatyiba, or wild mulberry, with slender stems and a profusion of light, glossy leaves; while before, and on each side of the house, was an orchard, or it might rather be called a thicket, of fruit-trees. The broad dark leaf of the fig hardly allowed its abundant fruit, in all stages of growth, to meet the eye, but the sunny orange and yellow lime gleamed from the depths of their verdant canopy, like—to use the odd but striking simile of honest Andrew Marvell—

'Like golden lamps in a green night.'

It was late in the evening. The full unclouded moon shone on the scene here described, lighting up the white walls of the humble cottage and the verdant masses of the orange grove. The tall sugar-cane and the rustling maize-stalks waved their tasselled heads and slender leaves in the soft night-wind. Now and then might be heard the sullen hooting of a distant owl, or the harsh scream of a parouet disturbed in its uneasy slumbers. All other sounds were hushed. The cattle were asleep in the corral, the fowls at roost on their accustomed trees. From the darkness and silence which prevailed, it appeared that all the inhabitants of the cottage were at rest, except in one room, which was lighted up, and into which we will make bold to enter. It was very simply furnished, as is usual throughout Spanish America. The brick floor was covered with fine straw matting. To the whitewashed walls were fastened a few ordinary pictures and engravings. Some light cane chairs were placed around the room, and at the farther end was an elevated dais or *estrada*, covered with the skins of the jaguar and puma, and serving as a lounge for visitors, or a couch for the siesta or afternoon nap. In the centre of the room was a table, made of the wood of the urandig-pital, a native tree equal to the finest rosewood. Two candles stood upon it, and numerous papers—some folded, and tied with tape, others open—were scattered over it.

A young man sat beside the table, deeply engaged in the perusal of one of the documents. He was dressed like a wealthy *haciendado*, or gentleman farmer. His jacket of blue cloth was adorned with silver buttons, hanging by little chains of an inch in length. His vest of white satin, elegantly tamboured, was open so as to show the embroidered front of his cambric shirt. His green velvet small-clothes, tied round the waist by a blue satin sash, were loose at the knee, allowing the ruffled ends of his muslin drawers to appear beneath them. They were met by white cotton stockings, and buskin boots of untanned horse-skin. The age of the wearer was apparently about twenty-five. He had the brown complexion, the dark eyes, the black, glossy hair, the thick beard and mustaches, which were proper to his Spanish descent. His handsome features wore an expression of deep sadness, and his brow was occasionally knit, as with indignation, while his eye glanced over the paper which he held. Just behind him, in another chair, but leaning on the back of his, with her eyes fixed earnestly on his face, sat a young woman of extreme beauty both of form and feature. It was a style of beauty, too, which is commonly thought peculiar to northern, or rather to cold climates, but which is, in fact, frequently seen in the interior of South America. Her chestnut hair clustered in natural ringlets round her fair face, and her dark blue eyes looked out with changeable lustre from beneath their

long brown eyelashes. Her slender form, betokening extreme youth, was attired in a simple robe of white muslin, bound at the waist by a ribbon, which was clasped with a golden buckle. It was easy to see that the natural expression of her countenance was bright and cheerful, as of one accustomed to a life of great happiness; but at this moment her look was constrained and anxious, and her eyes were fixed earnestly upon the young man, whose attention was engrossed by the manuscripts. At last she spoke, as if unable to endure the silence.

'Do you think there is any hope, Enrique?'

The young man started, and throwing from him the papers which he held, exclaimed in a tone of mournful bitterness, 'What a fool am I to pore over these long-winded pleas, rejoinders, judgments, and all their legal trash, as if they could have any influence on my cause! Do I not know that it was lost from the beginning! It is gold that has done it all—bribery, corruption! The pleading of an angel would not avail against such arguments. We are lost—utterly ruined!'

'Surely, Enrique,' replied his companion, 'the judge cannot allow his friendship for Don Manuel to bias him to so frightful a degree? All the city knows that Prieto's claim to your patrimony is utterly unfounded; and your evidence, too, is so strong.'

'Listen, Rosita,' said the young man, 'to what I heard this morning from my friend Gomez. How Gomez learned the facts, he would not inform me; but he assured me that I might rely upon them. A year ago, when Don Manuel Prieto gave his daughter in marriage to young Echeverria, he said to him, "Carlos, choose which you will of my houses in town, or my estates in the country, for your residence, and it is yours." Echeverria answered, "I will not rob you of any of your splendid residences or your great plantations. Give me only a little cottage, with an orchard and a few fields about it, like that of Enrique Gonzalez, and I shall be happy." Then Prieto said, "If that be all you require, you shall have the very house and farm you speak of." Thereupon he came to me and offered me a large price for the property—its full worth, and even more. I refused, instantly and positively, to sell my patrimony, which was endeared to me by the recollections of childhood. Why should I part with it at any price? Besides, Rosita, it was at that very time that I was preparing to lead you, my lovely, blushing bride, from your own happy home to the house of my fathers. Was that a time to sell my homestead? I told the old man flatly that all his fortune would not tempt me. Now, this is what I learn from Gomez. When Prieto returned home, he was bursting with fury at his failure, inasmuch as he had given his word to his son-in-law, and had expected that his doubletons would accomplish everything. He swore a solemn oath, that if it cost him his whole fortune, he would have my house and land, and that I should yet beg of him a pittance to save me from starvation.'

'Santa Maria!—Blessed Virgin! Can this be?' exclaimed the young wife in astonishment.

'This—this,' continued Gonzalez, 'is the origin of this sudden and outrageous suit, which at first I considered to be intended only for my annoyance, and as a mode of petty revenge. But it now appears too clearly that he is determined to push it to extremity; and his measures have been taken with such consummate skill, that no resource is left to me. The judge is gained. Every advocate has his retaining fee. I have even begun to doubt my own paid lawyer, Ramirez, who has suddenly become very cautious and cold.'

'Ramirez! He leagued with the enemy! Oh, Enrique, surely your suspicions mislead you?'

'I fear—I greatly fear: at all events he gives me no hope.'

'And is there no one,' asked Rosita, 'whom you can trust?'

'Not one of the whole court,' replied her husband in a tone of despair. 'The only advocate who cannot be bribed, and of whom lawyers and judges alike stand in awe, has long been my implacable enemy.'

'The Dr Francia?'

'Yes; ever since that unhappy affair of Gomez and Paredes. I remember well the terrible scowl he wore when he said to me, "You have wilfully crossed my path; you have injured one who never forgets a favour or an offence." Since that time, he has done all in his power—openly and fairly I admit—to thwart, annoy, and injure me. Nor have I been slow, I confess it, to retaliate. He is an intimate friend of Prieto's. Oh how he must exult in my approaching ruin!'

'Not, surely,' said Rosita, 'if he be the honest, upright man he is proclaimed to be. His integrity must revolt at such injustice.'

'There are many esteemed very honest,' replied Gonzalez, 'who will rejoice in a result attained by evil means, provided they are not responsible for the evil-doing. But,' he continued, rising from his chair, and pacing the room with hasty steps, 'what is it to me who exults or who laments over my unhappy fate? What is certain is, that in three days we are driven forth, to beg or starve, from this house, in which I fondly hoped to spend a long and happy life with thee, my beloved. Ah, Rosita! what day-dreams have been mine of the pleasant future which awaited us here, but which will never be ours to enjoy! It is not for myself that I grieve. I can struggle with the current. But when I think that I have drawn you from the peaceful shelter of your paternal roof in Villa Rica to this distant city, to share in my desperate fortunes, I am ready to go mad with remorse and rage.'

'And this is the way you treat me!' replied the young wife in an offended tone. 'When I, poor, foolish creature, was thinking that my presence and my love would be some alleviation to your misfortune, you do your best to distress me by calling them an aggravation. Come here, sir,' she continued, seizing him by the hand, and pulling him with gentle force to a chair by her side—'sit down by me, you treacherous man, and tell me what you married me for. Was it only to have me in your house like a great doll, prettily dressed, for a plaything and a show? Or was it merely that I might keep you company, and entertain your friends in *tertulias*,* and make your *maité*,† and see that your clothes were in order, and your dinners well cooked? No, sir; your *ama de llaves*‡ did these things quite as well as I. Well, then, was it to be your helpmate, to love you in joy and in sorrow, to comfort you, to toil for you, to pray for you, to believe that there was no unhappiness where you were, and to make you believe so too? Oh, Enrique! you do not know me. You are a man: well, am not I a woman?'

'You are an angel, I believe,' said Enrique, interrupting her rapid speech by clasping her round the waist.

'Let me alone. I say I am a woman: and are there

* Evening parties.

† Paraguay tea, made from the leaves of a tree peculiar to that country.

‡ Housekeeper; literally, mistress of keys.

not poor women as well as poor men? And do not women have to toil and suffer as much as men? Yes, truly, and a great deal more. Now, Enrique,' said the lovely pleader, leaning with her clasped hands on her husband's shoulder, and looking fondly in his face, 'listen to my plan, which I have formed while you were poring over your musty papers. When we leave our dear home, which I shall regret as much as you, for I have had my day-dreams too, Enrique'—and a tear, unbidden, stood in her bright blue eye—'but when we leave it, you shall hire a little hut, and a little piece of ground, such as we can find for twenty dollars a-year, like that which old Antonio lives in—the old Mulatto, who talks all the time with his Indian wife, who never says anything: just like me, you know.'

'But where are we to find our twenty dollars, you dear little St Tacita?' interrupted Enrique, smiling in spite of himself.

'Hush with your impertinent inquiries. You are worse than a lawyer. Why, my earnings are worth more than sixty dollars; so there is three years' rent at once. You shall cultivate the ground, and raise your yams, your maize, and your pine-apples, your water-melons and your musk-melons, your sugar-cane, and, above all, your cotton; while I shall take care of the house—which won't be much, you know; and then I will pick and card your cotton, and spin and weave it, and cut it, and make it up, and tambour it so, that the governor himself shall be only too happy to give a hundred dollars for a shirt from my fingers. Moreover, every Saturday I will go into the market, like the other *paisanas*,* with my donkey, and my panniers filled with all the good fruits that you will raise, and all the nice and pretty things that I can make—my tarts and pies, my bouquets, my toys and *cigarrillos*!† Ah, I think I see myself in a corner of the market-house, in my white petticoat and embroidered vest, with my little *rebozo*‡ on my head, seated in state on my mat, with all my wares about me. I am sure I shall draw all the custom. Buy a water-melon, senor? Buy my candles, senorita—elegant mould candles? Here's your nice new-laid eggs! Here's your beautiful onions! Here's your fine white yams—yams—yams! Ah, buy a pie, ma'am, baked this morning, I assure you; or a bunch of elegant flowers, for the dear good saint;§ or a sweet pretty little doll for the charming little senorita; or a little whip for the dear little senorito to whip his beautiful little horse with? The lively Rosita mimicked so admirably the tones and manner of the market-women of Assumption, that her husband shouted 'Bravo!' and clapped his hands, and laughed till the tears ran down his cheeks. It was a delightful scene; and it ended by his clasping once more his lovely wife to his bosom, and thanking Heaven that he had one treasure of which Prieto could not deprive him.

At this moment they were startled by a loud knock at the outer door. 'Who can it be at this hour?' said Enrique.

'Some messenger from the city perhaps,' replied his wife. 'Here, Rossi,' she said, opening the door of the apartment, 'go and see who it is that knocks.'

Rossi, their trusty Mulatto servant, who was nodding in the passage, arose, rubbed his eyes, yawned, and proceeded to obey the commands of his mistress. He returned in a minute with his eyes wide open, and every trace of drowsiness banished by consternation. 'Oh, senor! oh, mistress!' he stammered; 'it is that man, Dr Francia! Shall I let him in?'

Rossi knew well the inveterate enmity between his master and the doctor, which was indeed notorious to

all the city and neighbourhood. 'Dr Francia!' exclaimed Gonzalez, no less astonished, and much perplexed. 'What can he want with me?'

'Perhaps he comes from Don Manuel to propose some compromise,' suggested his wife. 'Pray see him by all means.'

'Well, Rossi, desire the doctor to enter. We shall know our fate.'

Rossi returned to the door, and shortly afterwards a hasty step was heard in the passage, and the person of whom they spoke entered the room. His tall erect form was clad from head to foot in scholastic black, with the exception of his ample cloak of crimson cloth, which was wrapped around his shoulders after the Spanish fashion. He might be above forty years of age. His face was long, with strongly-marked features; thin lips firmly closed, dark piercing eyes, and a swarthy complexion, but with that peculiar tinge of sallowness acquired by close confinement and study. His dark hair was drawn back from his capacious forehead, and fell in heavy masses on his shoulders. His whole physiognomy conveyed a strong impression of intellect and firmness. He waited for no salutation, but spoke at once. 'Senor Don Enrique, I know that my presence here is as unwelcome as it is unexpected.'

'I am honoured,' began Gonzalez; but the doctor interrupted him with a hasty motion of the hand.

'I do not come to bandy compliments, senor; but on an errand of duty. You are now engaged in a suit with my friend Don Manuel Prieto (he pronounced the word 'friend' with a strong emphasis, by which you are about to lose this house and estate. From what I learn, it appears that his suit is an atrocious outrage on law and justice, and is likely to be gained by a violation of every legal and honest principle. Is this the truth, senor?'

'It is,' replied Gonzalez eagerly, 'as surely as that there is a just God in heaven!'

'This must not be, Don Enrique,' replied Dr Francia. 'I cannot allow the law, that noble science to which I have devoted my life, to be so perverted to an engine of fraud and oppression. I am the friend of Don Manuel; I am, and shall ever be, your enemy. But I am more the friend of right, and the enemy of wrong. I offer you my services. Will you trust me with your cause?'

'With my life!' exclaimed Gonzalez, astonished and overjoyed. 'Oh, senor, under what a load of obligation do you lay me!'

'Under none,' returned the lawyer hastily. 'I serve the cause of justice. We are enemies now and ever!'

'Surely, senor, not now?' exclaimed Rosita. 'Not after this?'

'Madam,' replied the doctor coldly, 'neither my friendships nor my enmities are like a cloak, to be put on and off at pleasure, and thrown aside when worn out. These, I perceive, are your documents,' he continued, sweeping from the table the pile of papers which lay upon it, and collecting them under his arm within his cloak. 'Have no further anxiety, Don Enrique; your cause is safe. I do not think that Don Pedro de Sarmiento will dare to trifle with me!' he said proudly, drawing up his stately form to its full height. 'Let him beware: if he turns to the right or left, he is lost. Judge of appeal as he is, royal auditor as he styles himself, I will drag him from his seat to ignominy and ruin. What! is it come to this, that a corrupt judge and venal advocates shall twist the law with impunity to their own vile ends, and rob us of our fortunes without redress? I, José Gaspar Francia, say that this thing shall not be. Farewell, sir; I repeat it, your patrimony is safe. Adieu, madam; I kiss your feet;' and bowing with ceremonious politeness, the great lawyer abruptly turned, and departed as hastily as he had come. He left behind him glad hearts and joyous countenances.

'How much better are the grim doctor's acts than his words!' said Rosita. 'Surely he cannot be in earnest when he speaks of enmity?'

'Dr Francia seldom speaks in jest,' replied Enrique;

* Peasant women.

† Little cigars made of tobacco, cut fine, and wrapped in a slip of paper or maize leaf.

‡ A sort of scarf, thrown over the head or round the neck at the pleasure of the wearer.

§ It is common throughout Spanish America to have an image of the patron saint in the best room of the house, and great care is taken in dressing and adorning it with jewels and garlands.

'but what matters his enmity after this? I defy him to do me as much harm hereafter as he now does me good!' Ill-founded confidence! Alas! there came a time when Gonsalez would have given house and land, and all his hopes of worldly prosperity, to buy even the miserable boon of eternal banishment from the country in which Dr Francia dwelt!

SCENE THE SECOND.

Twelve years have elapsed since the scene just described. We must now ask our readers to accompany us to the Casa de Gobierno, or government house, in the city of Assumption, the capital of the free and independent republic of Paraguay. It is a large low edifice of whitewashed brick, with no pretensions to elegance or state. At one extremity of it is a room of moderate size, very poorly furnished. A long table which occupied the upper end, close to the wall, supported a double row of books, and several astronomical and surveying instruments. At a small round table, in the centre of the room, was seated a youth of pleasing intelligent appearance, engaged in writing; while a tall elderly man, dressed in black, but with a crimson cloak thrown around his shoulders, walked slowly up and down the room in deep thought. It was Francia, no longer a simple doctor of laws and advocate, but, by the election of his fellow-citizens, and the force of his indomitable will, supreme dictator of Paraguay, the absolute ruler of the country. There was little change to be perceived in his appearance, except that his hair was slightly grizzled, and his countenance gloomier than ever. At length the young man ceased writing, and after glancing timidly towards the stern dictator, as if to ask permission, he said, 'May it please your excellency, the letter is finished.'

'Read it,' said Francia.

The young man read the document, which was a letter directed to the public authorities of Buenos Ayres, positively refusing to enter into any treaty, either of commerce or alliance, with them. When he had concluded, the dictator said, 'Very good. Transcribe it, and bring it to me for my signature. You have a good style, Villarino, and your compositions please me.'

'Ah, your excellency,' stammered the youth, much gratified by a speech of commendation from his stern master, 'if the supremo would but allow me to speak.'

'Well, what is it?' inquired Francia, turning and directing a piercing gaze at his secretary.

'I am proud to obey your excellency's commands, whatever they may be,' said the young man; 'but may I not venture to express a wish that my honoured master would regard the foreign policy of our country in a somewhat different light?'

'Well, go on!' said the dictator in a deep harsh tone, observing that the secretary hesitated.

'I shall be miserable if I offend your excellency,' continued the young man; 'I only thought, that possibly, without perplexing ourselves by foreign alliances, we might cultivate an advantageous commerce by exchanging our surplus productions for their cheap and useful wares.'

'Have you finished your lecture?' inquired Francia with a tone of bitter sarcasm, and a ferocious scowl.

'Ah, pardon!—pardon!' exclaimed the unhappy youth; 'I meant not to offend.'

'When I took you for my secretary,' continued the unrelenting dictator, 'and favoured you by my countenance, I trusted that you had at least the sense not to burn your fingers by thrusting them wilfully into the fire. So you are a political economist, senior! and aspire to be a partner in my government. Do you know how I treat such intermeddlers?'

'Pardon my folly, my lord!' cried the youth, still more and more terrified. 'I will never offend again!'

'Out! away with you!' thundered Francia, stamping violently on the floor. 'Quit my presence now and for ever! Remain in your house till further orders. I will take care that you never repeat the offence.'

The unfortunate secretary slunk terror-stricken from the room, while the excited dictator paced up and down like an enraged tiger in his lair. His eyes glared, and his brow was knit. 'Shall I never find a tool,' he said, 'who will not erect himself into an adviser?' Suddenly the door opened. 'Ha! thou villain, wouldst thou assassinate me?' cried the despot, rushing to the table, on which lay two loaded pistols and a drawn sword.

'Oh, Senor Excelentissimo, it is only your poor servant,' said the new-comer in a piteous tone, dropping on his knees; 'I thought I heard your lordship's excellency bid me enter.'

'Ha, Estevan! is it thou? Beware how thou rushest so hastily into my presence, or thou mayest chance to repent it with a bullet in thy fat carcase. Well, what news?'

The person addressed was a little, plump, round-faced man, with an air of good-humour and sly cunning on his oily features. He might be, from his appearance, a small shopkeeper, or perhaps a publican. Scratching his head, as if to collect his scattered senses from the shock of his first reception, he replied, 'I have not much to tell your excellency, but I learn that Don Domingo Saavedra and Don Vicente Valdez meet frequently, and in private, at the house of Don Fernando Pinto.'

'Ha! well, that corresponds!' said Francia. 'What more?'

'Manuel Artigas says, that if you compel him to pull down his house to form your new street, he shall expect compensation.'

'He shall have it—free lodgings in the public prison. I will have no grumblings at my plans for the improvement of my capital. Anything more?'

'The old Pelado says that you can drive out the Franciscans to-day, but your own turn may come to-morrow.'

'He says so?—the scoundrel! I have long borne with his mutinous expressions. Good! No one suspects you of communicating with me, Estevan?'

'No, your excellency; thanks to my little office and my management.'

'Well, go! Be faithful, and you shall meet with your reward.'

The spy departed, and the dictator ringing a bell, a sergeant of the guard entered. 'Sergeant,' said Francia, 'you will take a file of men, and arrest Manuel Artigas without delay, and commit him to the public prison. This will serve him for lodgings while his house is pulled down, and teach him discretion. Tell him so. You will then proceed to seize the old Spaniard, Ruiz Palacios, commonly called the Pelado; iron him with a double bar, and have him ready for the banquillo to-morrow morning, as a warning for all traitors.'

'Yes, your excellency. I have to report that the French merchant, Latour, is at the point of death. He is with his family at the house of his father-in-law, Don Pedro Cortina.'

'Very well. Place a guard in the dwelling, and also in his warehouse, and the moment he dies, seize his property for the use of the state. Our treasury is getting low; and whatever happens, my faithful troops, who love me like children, shall not want their pay. You may go, sergeant.'

The soldier departed on his errands of terror, enchanted with the favour shown by his master to the body to which he belonged, and by means of which the crafty despot secured his ascendancy over his fellow-citizens, and maintained his arbitrary power. A low knock was then heard; and after a reiterated command to enter, the door was gently opened, and a man appeared, dressed in the garb of a cura, or parish priest. His face was pale, and his look constrained and downcast.

* The 'little bench' or stool on which criminals are seated for execution.

'Well, Pai* Melindez, what word from your penitent?' inquired the supremo.

'Dona Teresa informs me that, from the expressions let fall by her lover, she is more than ever convinced that some plot is going on in which Saavedra and Vicente Valdez are concerned. But she cannot acquire any certainty with regard to their designs.'

'Have you warned her that her salvation depends on bringing you a full and accurate report of all she sees and hears on the subject?'

'Yes, your excellency.'

'Well, then, I warn you, Pai Melindez, that your salvation—do you understand?—depends on your bringing me a full report of all you see and hear on that and every other subject.'

'Yes, your excellency; I endeavour to do my duty,' answered the poor priest submissively. 'I was this evening at the country-house of Don Enrique Gonzalez, where there was a large tertulia, to celebrate the recovery of his charming wife, after the birth of their fourth child. A lovely family is that of Don Enrique.'

'Pah!' interrupted the dictator with a scowl. 'What is this trash about lovely children and charming wives, with which you are stuffing my ears? Beware, Senor Cura; tell me what is important for me to know, and remember that I have other sources of information to check you if you play me false.'

'Don Enrique spoke of your excellency, and of the noble manner in which you rescued his patrimony from the clutches of his villainous enemies.'

'Ha! well?'

'He said that he could not conceive how the Dictator Francia and Dr Francia the advocate should be the same man.'

'Don Enrique has a feeble imagination,' said the despot in a dry sarcastic tone. 'Well, what else? There was more of it?'

'Yes, your excellency,' replied the unhappy priest, twitching at the sleeve of his cassock, and hesitating with a look of distress; 'he said that if you continued to add to your prisons, and the number of their inmates, you would shortly not have subjects at large sufficient to guard those in confinement.'

'He said that!' exclaimed Francia, pausing for a moment. 'The fool! The senseless, babbling idiot! I have spared him so long, because I considered him too weak an enemy to deserve more than contempt. And yet, not appreciating my clemency, he must talk!—must express his idle, worthless opinions about my state policy, and do his best to excite disaffection against me. He shall learn, and his associates shall take warning, that I have yet faithful subjects enough to keep watch over all traitors. Begone, Sir Priest!'

The curate departed, and the little tinkling bell summoned a sentinel, whom Francia directed to call the Captain Orbegoso. In a few minutes the captain made his appearance—a ruffianly-looking soldier, with immense whiskers and mustaches, and dressed in a blue uniform, with red facings, a blue sash, and epaulets. He held in his hand a letter, which the dictator instantly remarked.

'Ah! A petition from my children—my soldiers?' he inquired.

'No, your excellency; it is a letter which was found on the table of poor Villarino. They have just brought his body home from the river.'

'What! drowned?' exclaimed Francia astonished; and snatching the letter, he tore it open, and read as follows:—

'TO HIS EXCELLENCY THE SUPREME DICTATOR.

'It is now two years since your excellency deigned to cast your eyes on me, and consider my poor abilities worthy of your service. I appeal with con-

fidence to your excellency to attest the fidelity, the assiduity with which I have devoted myself to the duties of my office. For a single inconsiderate observation, intended for the benefit not less of your government than of our common country, I am driven from your presence, and threatened with the same doom which has overtaken so many worthier citizens before me. I understood but too well the meaning of your excellency's last words. But the name of Villarino shall never, through me, be sullied by the infamy of the banquillo or the state-prison. I do but anticipate my fate, which was sure to overtake me. I spare you the annoyance—may I say the pain?—of directing my punishment. In return, I will venture to hope that, if hereafter any member of my family should be so unfortunate as to incur your displeasure, you will pardon him, remembering that you have already had one voluntary victim in the unhappy JOAQUIN VILLARINO.'

The letter fell from the hands of the dictator. An unwonted expression of regret lingered for a moment on his harsh countenance; but it soon passed away, and recovering himself, he observed, loud enough for the captain to hear him, 'The poor fool must needs meddle with matters above his sphere; and finding that his impertinence offends me, he sees fit to leap into the river. Well, so be it. Perhaps he is right. He has saved me trouble. Sooner or later, it must have come to this. No government can endure the officious interference of unqualified subjects, and it is necessary,' he continued, looking steadily at the officer, who quailed beneath his glance, 'to repress it by any means whatsoever. Orbegoso, you will take with you twenty dragoons, and proceed to the house of Don Enrique Gonzalez: arrest him instantly; drag him, if need be, out of his bed; convey him to the prison in your barracks; have him heavily fettered, and place him in the dungeon heretofore occupied by Pedro Garcia, who died this morning. There let him rot, as a warning to all impertinent babblers who cannot restrain their tongues from wagging on forbidden subjects. Go!'

The officer made his obeisance, and departed. The dictator, seating himself quietly at the table, lighted a cigar, and was soon absorbed in a book, utterly regardless of the misery which in a few short hours he had spread around him.

Some of our readers may share in the doubt of poor Gonzalez—whether it can be possible that the bold, upright, incorruptible advocate described in the first of these scenes, could have become the heartless wily dictator, the suspicious tyrant, who has just been seen ruling a miserable people through the agency of hireling troops, of degraded spies, of jailors and executioners, and all the customary apparatus of despotism. Those of them, however, who have read the admirable 'Letters on Paraguay' by the Messrs Robertson, will be aware that all the important incidents of the narrative are strictly true; the only liberties here taken with them being in the minor details and descriptive portions of the story. The Dictator Francia is one of a long list of examples which prove the baneful effect of arbitrary power on the possessor. Before he became the ruler of Paraguay, he was esteemed the only man in the country fitted to govern it—so high was the confidence in his sagacity, his firmness, and, above all, his integrity. Had he not been trusted with unlimited command, it is probable that he would have made a most excellent executive governor. But having once acquired a dictatorial power, his unbounded pride and ambition incited him to use every effort to retain it. Then followed a pretorian soldiery, an all-pervading espionage, severe exactions to supply a failing treasury—rebellions, conspiracies, proscriptions—the dungeon, the torture, the ignominious death. Such, by the teaching of history, and the experience of all nations, is the regular and inevitable sequence of results which flow from the establishment of an irresponsible authority. No benevolence is so hearty, no honesty so pure, no humility so lowly, as not to yield at last to the

* *Pai*, which signifies 'father' in the Guarani or native Paraguayan tongue, is the term by which priests are usually addressed in that country.

engrossing sway of the passion for domination. It is therefore no exaggeration to say that the restraints of constitutional forms are, at least, quite as valuable to rulers as to their subjects; for if the latter have to fear the injurious effects of arbitrary power upon their external and temporal prosperity, the former have still more to dread its subtle and lasting influence upon themselves.

RIISING AND SINKING OF LAND IN NORTHERN EUROPE.

IN the temperate regions of the earth, we are so accustomed to associate the idea of perfect stability with the ground on which we tread, that we are prone to incredulity when told of upheavals of the land, which cannot be immediately referred to the action of volcanoes or earthquakes. And when travellers have witnessed one of the latter convulsions for the first time, their description of their sensations presents a singular mixture of bewilderment and alarm, jostling long-settled convictions. Startling, however, as may be the phenomena of earthquakes, the subsidence or elevation of hills, draining or formation of lakes, diversion of rivers, they only represent on the sudden what has in all time been effected by the slow and silent, though not less sure, operations of nature in various parts of the world. That such changes have taken place in past ages, many persons are willing to believe; but they incline to doubt the existence of similar movements in the present period. They have heard or read of beds of marine shells being found at elevations and places far remote from the sea, or of ancient vessels dug up far below the soil; but these things have been conveniently referred to the Deluge, or some sudden inundation, under the impression that since those events no farther commotion has happened. But the observations of scientific men testify to the alterations continually going on over large portions of the earth's surface, not less remarkable than those due to the violence of earthquakes.

Mr Lyell was the first to make these phenomena popularly known in this country, in his 'Principles of Geology,' a work which we are greatly pleased to see republished in a *seventh* edition, abounding as it does with sound and comprehensive views likely to do good service to the cause of geological science. This writer directed attention to the gradual elevation of the land in Sweden and adjacent portions of the north of Europe; and a summary of his observations, as amplified in the new edition, will serve to convey an idea of what is known of this interesting phenomenon.

We may premise that instances of upheaval and submergence are more general than is commonly supposed. Many changes of level are to be traced in the valley of the Rhine. In Sicily, shells, identical with those now existing in the Mediterranean, are found at a height of three thousand feet above the sea level. Calabria presents similar appearances. The latter country, it is thought, is slowly rising—a point not yet determined, owing to the comparatively short period during which observations have been made. In the bay of Balae, fish are now caught on certain parts of the coast, which, in 1807, were dry land: the depression goes on at the rate of one inch in four years. Places on the coast of Asia Minor are slowly increasing their distance from the sea; and according to Von Hoff, a German writer, the island of Tahiti gains in height every year. Mr Darwin has shown that the bed of the Pacific Ocean has undergone frequent upheavals and depressions, the coral reefs being sometimes elevated into mountain-ranges, at others sunk fathoms below the level at which they were formed. In 1822, a portion of the South American continent, equal in extent to the British Isles, was raised; and similar movements are still going on. To turn to our own country: The town of Brighton once stood, where the chain-pier is now built, on a beach which the sea had abandoned for ages. In Shetland and Cornwall great changes have occurred within the memory of man.

Evidences of upheaval are apparent on some parts bordering the estuary of the Clyde. In the Isle of Arran a circle of inland cliffs is distinctly visible. A large portion of Lincolnshire was once covered by the sea, where cattle now graze; while on the opposite coast of Yorkshire, towns which were busy ports in the fourteenth century, are now covered by the waves. At one part of the Norfolk shore there is a depth of water sufficient to float a frigate, where, fifty years ago, stood a cliff fifty feet in height.

Many other facts might be adduced, were more required, to prove the existence of constant change. The results may appear small, when compared with the agencies at work, and the long ages required to produce them; yet when looked at as the means by which nature provides for the duration of her empire, we shall find reason to estimate them at their full value.

About the beginning of last century, Celsius, a celebrated Swedish naturalist, gave it as his opinion that the waters of the North and Baltic seas were slowly subsiding, the decrease amounting to nearly four feet in one hundred years. The fact he showed had been noticed by ancient writers, according to whom Scandinavia was formerly an island, but towards the ninth century had become part of the continent by the retreating of the waters. In common, however, with the early astronomers, who were deceived by *apparent* motions of the stars, so these writers, and Celsius himself, were deceived by the apparent subsidence of the sea. The speculations gave rise to a controversy, in which it was argued that as there was no proof of a rising of the ocean in other regions, there could be no sinking in the north. Playfair suggested that the appearances were due rather to an elevation of the land—an opinion confirmed by Von Buch, who, after exploring Sweden in 1807, expressed his conviction 'that the whole country, from Frederickschall in Norway to Abo in Finland, and perhaps as far as St Petersburg, was slowly and insensibly rising.' This declaration from so eminent an authority led to a more critical examination of the subject. Marks had been chiselled in the rocks on various parts of the Baltic shores, to serve as an index of the water-level. These were inspected by a commission in 1820-21, and a report was presented to the Royal Academy of Stockholm, in which the subsidence of the water, subsequently to the incision of the marks, was clearly demonstrated; at the same time new marks were made.

In 1834, Mr Lyell set out for Sweden, to convince himself, by actual observation, of the truth or falsehood of the theory advanced. He first visited the famous castle of Calmar: the bases of two projecting towers were once washed by the sea, but now they are above the sea-level, having risen four feet in as many centuries. He also examined the marks cut by direction of the commission in 1820-21, and found them in all cases from four to five inches above the surface of the water, which, when first cut, they exactly indicated; and after careful consideration of the facts, and inquiry among the most eminent Swedish engineers, assured himself that the evidence in favour of a rise of the land was altogether conclusive. The absence of tides in the Baltic, and the peculiar configuration of the coasts of Sweden and Norway, render the determination of the upheaval a comparatively easy task. On reference to a map of those countries, a range of small islands will be seen a short distance from the mainland, and following its indentations; these islands, locally termed *skär* (*shair*), are rocky and precipitous, and by repelling the violence of the waves, leave the space within comparatively calm. The natives take advantage of this circumstance for their short coasting voyages; and by passing frequently through the intricate channels, become perfectly acquainted with every rock. Notwithstanding the slowness of the upward movement, it is sufficient to derange the navigation: channels are narrowed, twisted, or altogether filled up. Rocks which formerly were sunken, are now several feet above the

surface of the water, and, by the resort of sea-birds and other accumulations, in time are converted into islands. As the process goes on, the hollows between dry up, and become pastures surrounded by fir-clad cliffs. Instances of this transformation have occurred, within the memory of living witnesses, both on the eastern and western coasts of Sweden. With regard to this change, Mr Lyell observes, 'My attention was frequently called to low pastures from one to three miles inland, where the old inhabitants or their fathers remembered that boats and ships had sailed. The traveller would not have suspected such recent conversions of sea into *terra firma*; but there are few regions where a valley newly gained from the sea may so rapidly assume an air of considerable antiquity. Every small island and rock off this coast is covered with wood; and it only requires that the intervening channels and floods should dry up, and become overspread with green turf, for the country to wear at once an inland aspect, with open glades and plains surrounded by well-wooded heights.'

While rowing to examine a marked rock forty miles to the north-east of Upsal, the boatmen pointed out rocks, from one to two feet above the water, which, when boys, they remembered to have been below the surface; and a channel then nearly dry, as one through which heavily-laden boats once passed. So accustomed are they to the natural evidences of the rise, that they detect them without reference to the artificial marks, but attribute the change rather to subsidence of the sea than to elevation of the land. At Löffgrund, a mark cut in a rock in 1731 was found to be nearly three feet above the present water-level. In the sixteenth century, the port of Gothenburg was twenty miles higher up the firth on which it is built than the place where it now stands, and, according to appearances, the waters are still retiring. At Gefle, Mr Lyell states, preparations were being made to remove the harbour nearer to the sea, in consequence of the increasing shallowness of the water. At some parts of the coast both of Sweden and Finland, reports are current among the villagers of wrecks and anchors dug up at places far in the interior; and the grass crops of meadows near the sea are said to be insensibly increasing with the gradual elevation of the land. Mr Lyell travelled across Sweden from the east to the west coast, on the summit-level, and found everywhere the same appearances as on the coast. The whole country affords incontestable evidence of upheaval, but varying in different districts, being greatest towards the north, where the rise has been from six hundred to seven hundred feet, near Christiana four hundred feet, and at Uddevalla two hundred feet. The elevation, however, has been neither uniform nor continuous; what is now rising was once sinking, interrupted by long intervals of rest. Near Uddevalla, on the western coast, on removing a shelly stratum from a mass of gneiss more than one hundred feet above the sea-level, barnacles were found clinging so firmly to the surface, that portions of the newly-exposed rock came away on detaching them. Other zoophytes were also met with in considerable numbers, of the same peculiar dwarfish structure as those at present existing in the Gulf of Bothnia. The finding of similar shells at places seventy miles from the sea in the interior of the country, divests the instance here referred to of anything like an accidental character; and proves most satisfactorily that this portion of the continent has lain for a long period below the sea, while accumulations have formed above it. Perhaps the most interesting fact noticed by Mr Lyell, is the discovery of a wooden fishing-hut, at a depth of sixty-four feet beneath the surface of the soil, during the excavations for a canal to unite Lake Mæler with an inlet of the Baltic. The structure was about eight feet square; the walls crumbled away on exposure to the air, but the floor-timbers remained sound. There was a rude stone fireplace in the centre, with fragments of half-burnt wood, and outside, a heap of wood piled up for fuel: not a particle of iron appeared to have been used in the construction of this singular building. It

was compactly buried in fine sand, on which coarse gravel and large boulders in wavy strata were superimposed. It has been shown that the submergence, if caused by a sudden inundation, would have left the boulders, as the heaviest portion of the materials, at the bottom, instead of where they are now found, at the surface—a position in which they have been deposited by floating ice. And we learn from this remarkable fact, that since the building of fishing-huts in Sweden, the land where the canal is dug has sunk during a period long enough for the deposition of strata sixty-four feet in thickness by the sea, and has subsequently been raised to its present elevation.

Observations on this interesting phenomenon have been made in Sweden for about a century and a half, and we see no reason to doubt their correctness. They are still carried on under the direction of Berzelius and other members of the Royal Academy of Stockholm, with a view to determine the direction of the upheaval. As yet, the evidence is in favour of an oscillation or see-saw motion from south to north. In 1749, Linnæus measured the distance of a large stone from the water, at Trelleborg, on the coast of Scania, the southern extremity of Sweden; it then lay one hundred feet farther from the sea than when measured in 1836—eighty-seven years later. In the seaports of this part of the country, the streets are in many instances below the level of the water—a situation in which they were not likely to have been built—and artificial mounds have been made to prevent the encroachments of the waves. It would thus appear that while the north is rising, the south is sinking; the proportion of dry land increases in the former, and diminishes in the latter. The changes to be brought about by such, as yet, mysterious movements, it is impossible to foretell. A similar phenomenon has been observed on the west coast of Greenland, where a tract six hundred miles in length is slowly subsiding. Low islands and buildings gradually disappear; and the native Greenlanders, it is said, have been taught by experience to desist from building his dwelling on the verge of the ocean.

The area of upheaval comprised in Sweden and the adjacent countries is of great extent, and may be much larger than as yet appears by the observations. According to the present data, it extends from Gothenburg to Torneo, and as far as the North Cape, but increasing towards the north, where, being covered by the ocean, its detection becomes difficult, if not altogether impossible. In length it embraces one thousand miles, and probably half that distance in breadth; and should the elevation still continue at the same rate, the upper portion of the Gulf of Bothnia, and a large extent of the sea on the west of Sweden, between Uddevalla and Gothenburg, will become converted into dry land. According to Humboldt, the bottom of the sea, now forty-five fathoms below the surface, would begin to emerge at the end of twelve thousand years.

Various hypotheses have been put forward to account for the phenomenon described in the present paper. Some writers refer all disturbances in the crust of the earth to the action of an immense central fire; others, on the contrary, attribute them to chemical agencies—decomposition of water, and magnetism. We need not call in the aid of so tremendous a power as that to be derived from an interior fire, only a few hundred miles less in diameter than the globe, to effect that which daily experience teaches us may be effected by a power similar to that exerted by the hydrostatic press; and it is well known that the passage of voltaic currents generates heat to a degree sufficient to account for volcanic and other convulsions. Experiments have been made in America as to the expansion of rocks by heat, from which, according to Mr Lyell, 'a mass of sandstone, a mile in thickness, which should have its temperature raised 200 degrees Fahrenheit, would lift a superimposed layer of rock to the height of ten feet above its former level. But suppose a part of the earth's crust, one hundred miles in thickness, and equally expansible, to

have its temperature raised 600 or 800 degrees, this might produce an elevation of between two and three thousand feet. The cooling of the same mass might afterwards cause the overlying rocks to sink down again, and resume their original position.' All the facts hitherto adduced tend to show that no geological period has been one of continued repose. In whatever quarter of the world we look, the same indications speak to us of the mighty changes which have been and are still in action in most intelligible language. 'It seems to be rendered probable,' writes Mr Lyell, 'that the constant repair of the land, and the subserviency of our planet to the support of terrestrial as well as aquatic species, are secured by the elevating and depressing power of causes acting in the interior of the earth; which, although so often the source of death and terror to the inhabitants of the globe—visiting in succession every zone, and filling the earth with monuments of ruin and disorder—are nevertheless the agents of a conservative principle above all others essential to the stability of the system.'

'LIKE IS AN ILL MARK.'

THIS is a Scotch proverb, which the lawyer would do well to keep in mind in his investigations of evidence, and the man of science in his endeavours to interpret nature. To be misled by resemblances, is one of the most common forms of error. A remarkable example has lately come under public attention in the northern section of the island.

The Scotch Presbyterians use a version of the Psalms dating from the Civil War, rugged and literal, though not without some merit. About seventy years ago, the refined taste of the Robertsons and Blairs prompted an addition to the national psalmody, in the form of hymns and translations of scripture; and ultimately the church adopted a group of about sixty such spiritual songs, which have ever since been generally used in Presbyterian places of worship. Of the *Paraphrases*, as these compositions are popularly called, many are possessed of considerable merit, a few being the production of John Logan, whose works are generally admitted into collections of the British poets; while others are the work of two private clergymen, Morrison and Cameron, who might have better ranked in the same list than not a few of their contemporaries who do.

About two months ago, a manuscript volume was brought to light in Edinburgh, containing this cluster of new psalmody, at an early stage in its preparation, with emendations in three different hands of writing, giving a glimpse of the process through which the poems went before they appeared in their present state. One of the hands was neat and feminine; the second, a rough but formal hand; the third—to quote a newspaper notice—'masculine, massy, mysterious: such a hand as at once arrests the eye of the autographologist, and which catches even the uninitiated, like some strongly-marked countenance, which, once seen, is never forgotten.'

The various literary gentlemen who saw the volume, did not for a moment hesitate to express their belief that this last hand was that of Robert Burns. The only point it seemed to them necessary to be anxious about was—the date. The *Paraphrases* having been finally arranged in 1781, could Burns have had a share in them? He might, for he was then twenty-two years of age—an obscure flax-dresser, indeed, at Irvine, but believed to have been even then known amongst the provincial clergy, some one of whom might have had an opportunity of consulting him on this subject. Then the nature of the emendations in the 'massy, mysterious hand,' was such as to argue the master of the lyre. On this point we may quote the able journalist who first called attention to the subject.

'In the amendments on the *Paraphrases*, we find unmistakeable marks of the "deep mouth." At how slight an expense of words, for instance, is the following

stanza (the 2d verse of the 50th paraphrase) redeemed from feebleness and commonplace, and rendered instinct with elegance and vigour! We find from the manuscript that it had originally stood thus:—

"Those bodies then, corrupted now,
Shall uncorrupted rise:
Mortal they fell, but rise to live
Immortal in the skies."

The magician touches it, and it takes straightway the exquisite form in which we now find it vested in the Assembly's version—

"Those bodies that corrupted fell,
Shall uncorrupted rise;
And mortal forms shall spring to life
Immortal in the skies."

In some instances we see a broken figure disentangled from the debris in which it had lain, and then repaired and set up in its integrity, as if by a breath. Thus, the 26th paraphrase had begun—

"Ho! ye that thirst, approach the spring
Of ever-flowing bliss."

The poet breathes upon it, and it becomes—

"Ho! ye that thirst, approach the spring
Where living waters flow."

In other cases the smallest sprinkling of words works a mighty change. Thus, the 4th and 5th verses of the 6th paraphrase had originally run as follows:—

"Though in his garden to the sun
His boughs with verdure smile;
Though deeply fixed, his spreading roots
Unshaken stand a while;
Yet when from Heaven his sentence flies,
He's hurried from his place."

As re-written in the hand of Burns, and in part adopted by the committee, the passage runs thus:—

"Fair in the garden to the sun
His boughs with blossoms smile,
And, deeply fixed, his spreading roots
Unshaken stand a while;
But forth the sentence flies from Heaven,
And sweeps him from his place."

In the second line here, the original words, "boughs with verdure smile," must have been preferred by the committee to the more euphonous "boughs with blossoms smile" of the poet; and in the concluding line, we find a "that" substituted for the "and." The reader will detect similar re-alterations, which are hardly improvements, in the following stanzas of the 48th paraphrase. We first give them in the original of the manuscript volume:—

"Now let our souls ascend above
The fears of guilt and wo;
God is for us our friend declared,
Who then can be our foe?
He who his Son, his only Son,
For us gave up to die,
Will He withhold a lesser gift,
Or what is good deny?
Behold all blessings sealed in this
The highest pledge of love,
All grace and peace on earth below,
And endless life above.
Now who shall dare to charge with guilt
Whom God hath justified.
Or who is he that shall condemn,
Since Christ the Saviour died?
He died, but he is risen again,
Triumphant from the grave,
And pleads for us at God's right hand,
Omnipotent to save."
Then who can e'er divide us more
From Christ and from his love?

The passage in the rendering of Burns runs as follows:—

* * *
"The Lord Almighty is our friend,
And who can prove a foe?
He who his Son, his only Son,
Gave for mankind to die,
Will He a lesser gift withhold,
Or what is good deny?"

Behold the best, the greatest gift,
Of everlasting love;
Behold the pledge of peace below,
And perfect bliss above.
Where is the Judge that can condemn,
Since God hath justified?
Who shall presume to charge with guilt
For whom the Saviour died?

The Saviour died, but rose again,
Triumphant from the grave,
And pleads our cause within the veil,
Omnipotent to save.
Then who can e'er divide us more
From Jesus and his love?

After all, the handwriting formed the only solid ground on which Burns could be believed to have intermeddled with the making of hymns; for though he published translations of one or two of the psalms, and entered, in his *Cotter's Saturday Night*, into the poetical aspect of religious life in the vale of poverty, it did not appear as if he were the kind of man likely to have assisted the General Assembly of the Scotch Church in any of its purposes. A holograph so peculiar that no one could say he had ever seen anything like it, seemed evidence sufficient, and so the matter rested for a time, as if a curious new chapter had been satisfactorily added to the life of the marvellous bard of Coila.

It at length appeared that the conclusion was premature. Several gentlemen, possessing original letters of Logan the poet, looked them up to examine the handwriting. To the surprise of those who had first pronounced for Burns, the holograph of Logan proved to be nearly the same! There was a slight difference in point of force or boldness between the writing of the emendator and the common hand of Burns—the former being the weaker—and a few of the characters, particularly the capital letters, were invariably formed differently. Now the handwriting in the volume was more near to the degree of strength or massiveness presented in Logan's writings than to that of Burns's. The special peculiarities, too, were all identical with those in Logan's writings, and different from those of Burns's. It therefore became manifest that Logan, who avowedly wrote several of the Paraphrases, had also been employed in amending them. Burns, consequently, for anything that appeared, had had nothing to do with them.

We have thought it not amiss thus to chronicle the mistake; because, next to seeing how truth may be attained, it is well to see how error may be fallen into, and by what cautions it may be avoided. Every day we are adopting misapprehensions from real or fancied resemblances. Let the old Scotch proverb be kept in view—*Like is an ill mark*.

HOPPING IN KENT.

THE long bright summer of this year, 1846—a summer which many old people declare to have been unequalled in warmth and beauty by any their memories can recall—is now ended, and we have reached the equinox once more. I am just now making holiday in a large old Kentish farmhouse, which 'beats all creation' in a peculiar style of old-world beauty. It is an ancient manor-house—part of it is in ruins, uninhabitable but by bats, owls, and ghosts. The inhabited parts of the house are of three different periods of building: outside, you admire the tall, various-fashioned chimneys, the pointed gables, the ivy-covered walls and old casements, and the picturesque no-design in the whole gray, time-hallowed edifice; and inside, you admire the steps up, and the steps down, into sundry rooms; the Gothic arched bedroom doorways; the oak staircase and doors; the slanting old floors; the huge chimneys; the queer closets; and, above all, the great kitchen fire-place, with a chimney as big as a small room, where you can sit, six or eight together, within the ingle, and push the great logs of wood about with your feet, while you chat or watch the thick wreaths of smoke as they glide up the chimney, and circle round hams and bacon,

and tongues, remains of the defunct denizens of the farm-yard.

Dear old L—— Court! (for it retains its ancient aristocratic designation) each year that I visit you, your beauty seems to grow dearer to me. This sweet place, with its hamlet or village of the same name, lies in a quiet, open valley, unknown to the general traveller through the country. It is a great way off a high road; and excepting the few cottages in the village, and the small house of the clergyman, there is no building near, except indeed the church, which stands apparently in the garden, but which is really parted from it by a low wall. As I look up from my paper now, the quaint old garden—in this part about twenty yards wide—is all that separates the room in which I sit from the church-yard wall; and immediately on the other side of that rises the old church-tower, covered with ivy, which is now in full blossom.

I almost hope that you are, like myself, a dweller in the land of bricks and chimney-pots—so will you relish the rustic festival the better. But I daresay you are not so much of a Cockney as I was when I first visited L—— some seven years ago. I was then too ignorant of the beauties of nature to enjoy them properly: I hardly knew a dandelion from a dahlia; and I certainly did not know *hops* when I saw them. Since then, my love of nature has increased with my knowledge of her; and this, my first visit to L—— during the hopping season, has given me great pleasure; and I will tell you all I have learned about 'hopping,' if you are disposed to listen.

It was between nine and ten o'clock at night, and quite dark, when I arrived here, about a fortnight ago. As we drove along through the narrow green lanes, I observed, here and there, in fields, or on a sheltered spot near the road, bright fires blazing, round which stood or sat groups of men, women, and children, eating, or drinking, or idly resting. Near the fires were to be seen the oddest-looking little huts—just like gigantic dog-kennels made of new straw. I had never seen a gipsy encampment like this; besides, the people, though wild and ragged enough in most cases for gipsies, had not, as far as I could judge by the fire-light, in our quick passage by them, any of the physical peculiarities of the Egyptian tribe. I inquired who these people were, and was informed that they were 'hoppers.' 'Stranger hoppers—from London chiefly.' On further inquiry, I learned that in plentiful hop seasons, like the present, the hop-growers are glad of more assistance than they can obtain in their own neighbourhood, for picking the hops; that poor persons (many from London) come down into the hop-growing country, with their children, in search of employment in the hop-gardens. Their employers generally have a few trusses of straw made up into little huts for them to sleep in during the week or two that they remain. At night they light fires of broken hop poles, and warm themselves while their supper is cooking. They pass the night in these straw huts, and the whole day, from six in the morning till six in the evening, in the hop-gardens. When the weather is as mild and beautiful as it has been during the last three weeks, there can be no hardship in this *al fresco* life; though, in some severe seasons, when the hops are not fit to pick until later in the year, and when the rains are abundant, the poor hoppers have not a very comfortable existence. This year, however, they have in most cases, I should think, derived great benefit from the change from the narrow alleys and courts of London, to the pure air and rural toil in the hop-gardens. It was quite delightful to see how a week or two's rustication coloured the cheeks, and brightened the eyes, of the puny things which Dickens calls 'town-made children.' And I daresay they will remember through the dreary winter, in Shoreditch, the wonders of the country which they saw while they were 'out hopping in Kent.' One sweet little girl, who told us that 'mother kept a fruit-stall opposite the Catholic chapel in Moorfield, and that they

lived in an attic in Half-Moon Street, Bishopgate,' seemed to look forward with great pleasure to the time next year when, 'please God she lived,' she 'should come again to pick hops at L—.'

May I venture now to tell how we pick hops at L—, and indeed wherever they grow in England; and, as travelled folks tell me, in Belgium too? Well, then, you must imagine before you a large hop-garden—say of twenty acres—full of regular rows of very tall poles, all encircled to the summit with rich graceful wreaths of hops. The plants, which belong to the Nettle order, resemble in general appearance a vine; but, instead of grapes, are furnished with loose drooping panicles, and bunches of imbricated scales, containing small seed-vessels. The latter, which are the flowers, and likewise fruit, as it may be called, of the female, constitute the hops, and are first of a green or greenish-white colour, then yellow when ripe, darkening into brown. Parties of pickers, consisting of men, women, and children, are stationed in different parts of the garden, each with a large bin before them; which bin is made of a poke or hop-sack, opened on one side, and fastened roughly over a framework of broken hop-poles. Into this bin the busy fingers of the group let fall the fragrant hops, as they strip them from the long wreaths, cut or torn off the poles. Some of the men are called pole-pullers, and it is their business to pull up the poles from the ground, and to supply the different sets of pickers with fresh poles as fast as they want them. This is the hardest work in the garden, next to carrying away the well-filled sacks when the day's work is done. Twice a-day—generally about the pickers' dinner-time, and again when they have finished for the day—a person employed by the proprietor, or perhaps the proprietor himself, goes to each set of pickers and measures their quantity of picked hops. This is done in a bushel-basket: there is a black line drawn inside this basket, at the height of half a bushel; and it is the custom, in measuring hops, to reckon as a whole bushel what remains in the bin at last, if it reach above this black line in the basket—namely, if it exceed half a bushel, this bushel, by surference, is called a 'catch.' It is amusing to see the excitement which prevails at the close of the measuring, in expectation that 'there will be a catch.' For my own part, I felt much better pleased when we had 'a catch,' than when we picked an exact number of bushels in our bin: there was all the satisfaction of getting the best in a bargain, which honest folks, let them say what they may to the contrary, cannot help enjoying. The measurers are often very expert, and empty in a few minutes the bin which it has taken a whole family as many hours to fill. As they are measured out, they are poured into a poke; when the poke is full, it is tied up, and carried off to the 'oast-house.' Here fires are kept up night and day, while the hops are being picked, to dry them as fast as they come in. Sulphur is put into the furnaces, that its fumes may improve the colour of the hops, which should be of a pale brownish-yellow hue. When they are thoroughly dried, the hops are heaped up on the floor of a large upper chamber; and here is carried on a process which is most ridiculous to the looker-on. This is treading the hops into the sacks, so as to press them into as small a compass as possible, each sack being made to hold a certain weight. The way it is done is thus:—There are circular holes cut through the floor of this chamber into the empty space below it; a poke is fastened by the mouth round each of these holes, so that it hangs down loosely below. This being strongly adjusted, a man begins to fill the poke with the dried hops, which lie around on the floor. Having thrown in a certain quantity, he springs into the poke himself, and forthwith begins to jump round and round in the sack, treading down the hops. To see the grave faces of the people who perform this ludicrous work, greatly enhances its effect. Their heads keep bobbing up and down like a Jack-in-the-box; and every now and then they stretch up a hand, and seizing the handle of

a huge rake, which they keep within reach, they bring down a fresh mass of hops on their heads, and tread it down under their feet. By continuing this absurd dance in the poke, they rise gradually out of it; but the same jumping goes on until the sack is full, and the treader's whole figure is seen jumping on a level with the floor, going round and round, in an uncouth dance, with all the solemnity of a spinning dervish. No description can do justice to the drollery of this part of the business of preparing hops for the market. When the poke is well filled, the indefatigable jumper ceases his jumping, the mouth of the sack is loosened from the floor of the oast-house, fastened up securely, and lowered by some machine to the ground beneath, where it stands ready for transportation to market.

The rate of payment to the pickers in the hop-garden varies with the state of the season. This season is a fruitful one; and in a good garden the hops are *valued*, as it is called, *at eight or nine*; that is to say, eight or nine bushels are picked for a shilling. In all seasons, the best pickers can earn about two shillings a-day. Women are in general the best pickers. The hoppers are paid either every night, or at the end of hopping. It is customary for the hoppers to contribute a trifle each, to buy the pole-pullers a favour, as it is called. This is generally some ribbons, or a silk handkerchief, with which they parade about at the hopping-supper and subsequent dance, which generally takes place on the evening of the last day's hopping, at the nearest ale-house.

The hop-garden itself is a very pretty sight when all the people are at work, or when they are taking their dinners on the ground. The young children play, and laugh, and talk in the intervals of picking, and the village youths and maidens carry on desperate flirtations, just as their betters do at a *fête champêtre*. Many a Kentish marriage has been made up in a hop-garden, just because the parties picked at the same bin. If we were to inspect too narrowly all that goes on in this apparently gay and happy scene, we might probably find a due mixture of disagreeables. There are quarrels in a hop-garden; and here, as elsewhere, we may find envy, hatred, and all uncharitableness; but this year things are so flourishing, that the hoppers appear almost as enviable as the Arcadian shepherds in the Golden Age. I cannot help regretting that hopping is well-nigh over, and look on the bare poles with the respect due to the supporters of so much beauty. Of all nature's wreaths—briony, travellers' joy, and wild convolvulus not excepted—the hop is incomparably the most beautiful.

WANTS AND WISHES.

MYSELF AND I.

ADAM SMITH, in his 'Theory of Moral Sentiments,' has some striking and beautiful thoughts respecting the interior judgment of the mind on its own impulses and acts; which judgment he supposes to be given forth by an ideal personage, whom he calls '*the man within the breast*'—a sort of supreme and infallible lawgiver, from whose decisions there lies no appeal. There are few thoughtful persons but must be sensible at times of this sort of *duality* within them; and to such observers of themselves, and perhaps to others, the following illustration of Adam Smith's theory may not be unacceptable.

Myself. I feel very restless; very unsettled and unhappy; and yet I don't know what I want.

I. Do you know what you *wish* for?

M. Oh yes; I wish for many more things than I have any chance of obtaining.

I. Probably, then, it is this hopeless state of *wishing* that causes the restlessness and disturbance of which you complain? Suppose that, for the better understanding of your mental disease, and the remedial treatment it requires, you endeavour to distinguish between your *wants* and *wishes*; and treating them as you would your wardrobe, if you were going a journey, take with you

nothing but what you absolutely *want*. Your cares and incumbrances will surely, in that case, be considerably lighter?

M. Very well. To begin with my wants. I want to be happy, and so to enjoy the boon of existence as to feel it a blessed thing to exist. This, you will allow, is indispensable?

I. Quite so. This want must travel with you for ever: let us, then, inquire how it is to be satisfied. And first, What do you conceive to constitute happiness?

M. I think I should be happy if I had sufficient money to enjoy myself, and live in the way I should like.

I. That is to say, you *wish* you had more money, that you might take as much pleasure as you like? Well, this is clearly no *want*. I think you may do without this. It is like a full-trimmed holiday dress, that takes up a deal of room in a trunk, to the exclusion of much more useful articles. We may throw that aside. What comes next?

M. I want to be distinguished and admired, and not to pass in a crowd as a mere nobody.

I. This seems to be of the order of wishes, not wants. I believe we may send it after the other, as useless. Come, keep to the indispensable; and consider, before you speak, whether it is a *want* or a *wish* that you are about to specify.

M. Why, really, when I come to analyse the matter, my wants appear to be so few, that when I have stated in general terms that I want to be happy, I seem to have comprised them all. However, I think we must agree that wants and wishes are so near akin to each other in the search after happiness, that it is scarcely possible to separate them.

I. Indeed I don't agree to this. On the contrary, I believe it is the habit of mixing and identifying our wants and wishes that causes so much confusion, mistake, and misery, to thousands of human beings.

M. At all events, you will allow that every living man and woman both wants and wishes to be happy?

I. The want is very clear, and quite unmistakable in its nature; but the wish is usually erroneous: that is to say, it does not perceive rightly its object, or the means of obtaining it. For instance: a man wants to be happy; this want is just as much a law of his nature as the want of food; and he wishes to satisfy it, just as when he is hungry he wishes to eat. But then the wise and necessary separation is to be made between the nature of the want and the wish, and the eye of the mind kept upon the watch, to preserve the requisite distinction, that they may not run into one, and thus be mistaken for the same thing. A man *wants* to satisfy his hunger with food, and he *wishes* to have it of the most delicious and luxurious kind; but this, surely, is not indispensable. At all events, if he makes it so, he *creates* a want that simple honest nature never gave him; and, you may rely upon it, she will revenge this infringement of her rules by appearing before him, when he least expects it, in some form of bodily suffering, by which, 'without speech or language,' she will intelligibly enough indicate to him that she is not to be offended with impunity. He *wants* to eat—let him eat, then; but he *wants* also to be in health. Does he *want* this, or only *wish* it? He *wants* it; for a state of health is indispensable to the enjoyment of his existence, and to the fulfilment of those duties which are annexed to the condition of human beings. Let him be careful, therefore, so to regulate and subdue his wishes for the pleasures of the table, that they may be the servants, not the masters, of his wants. In like manner, a man wants to be happy.

M. (With an ejaculation between a groan and a sigh.) And oh the quantity of pretty things this world has to give to make him so! all of which are embodied in their representative—money. Who that wishes to be happy, can ever cease to wish for the possession of money?

I. Might you not as well say, 'Who that is hungry, can ever cease to wish for venison and turtle soup?' A hungry man that is under the dominion of nature—that is to say, who has never spoiled her simplicity of desire by the stimulus of luxurious feeding—will enjoy, and be refreshed, by the plainest food; and, in fact, the plainer it is, the better he will like it, because it will harmonise with the humility of nature, which never asks for more than she wants.

M. How comes it, then, that in seeming to follow the dictates of nature, or, in other words, in pursuing their natural inclination to enjoy themselves, so many persons make shipwreck of everything?

I. Just because they mistake the wishes of the *will* for the wants of nature. Nature has her wants; but she has also a spiritual rule to regulate and govern these wants: a rule which goes by different names—as reason, conscience, the moral sense, &c. (but which, when analysed, mean one and the same thing). As she and her rule are observed and obeyed, they gradually subjugate the lawless wishes of the will to their proper governors. But when the case is reversed, and the modesty of nature, and the dignity of reason, have their dominion usurped by those wild impulses of the will which are generally caressed and nourished under the gentle name of *wishes*—no wonder that shipwreck is made of everything.

M. It would seem to be, then, that I may want as much as I like, but wish for nothing.

I. Horace says, according to Pope's version of him,

'Not to desire, is all the art I know
To make men happy, and to keep them so.'

And of this you may rest well assured, that every wish which is not founded upon a want, is a wish which it is quite essential to your happiness to resist and conquer; and for this reason, that it is in vain for you to attempt the satisfaction of it—inasmuch as it proceeds from the all-devouring voracity of the will, 'which grows by what it feeds on,' and thus becomes insatiable. Did you never hear a mother or a nurse say to a fractious, spoiled child, 'You don't know what you *would* have?' And did you never observe what sort of men and women spoiled children make?

M. A torment, no doubt, they are to themselves and everybody about them.

I. Yet they did not grow into this state of torment because their *wants*, but because their *wishes*, were gratified.

M. But if we are to gratify only our actual wants, I do not see what pleasure or amusements we are to be allowed; for it is very easy to make out that we do not want any recreation.

I. No, it would not be easy to make that out. Cheerful recreation is as much wanted for the mind as food for the body; but, as well as the food, it should be of a wholesome, refreshing kind. And here, how sweet and simple are the dictates and impulses of nature! Look at the first dawns of intelligence in an infant, in its attempts at what is commonly called 'taking notice.' The smile of wonder at the dangling of a string, or the mystery of its own little delicate fingers, as the pretty hand is held up and gazed upon; the quiet contentment (if the disordered will be but properly guided and governed by those who have the care of it) with which, as it grows in capability, it amuses itself, by finding its natural, proper, and appointed enjoyment in the very bliss of *being*, and the calm, simple pleasures that belong to a state of being—all this sufficiently indicates that, until stimulated by artificial excitements, and bewildered by their multiplicity, the creature has no difficulty in fulfilling the Creator's will, that it should be happy.

M. Are there never any invasions upon this tranquil state of enjoyment? Does not *being* exhibit a reversed side of the picture?

I. Doubtless it does; just as inanimate nature presents us with storms and volcanoes, as well as calm and

sunny skies, and smiling landscapes. The volcanic will of the child—more or less impetuous, according to the physical organisation of the subject—will of course manifest its impulses; and upon the proper treatment of these exhibitions of evil, will the future happiness of the individual mainly depend. Let nature, and nature's interior rule, be minded and helped, and the creature constantly be taught to distinguish its *wishes* from its indispensable *wants*, and to keep the former in subjection to the latter, and in due time but little will be wished for beyond what is wanted; for at the last, it is commonly perceived by all, even by the most mistaken in their previous course, that those things which we could not properly do without, were the only things which it concerned us to wish for the possession of. We cannot do without happiness: let us be careful, therefore, to prize and seek for those things that make happiness. They branch out into many ramifications, but may be traced in their origin to two roots—namely, that which regards the body, and that which regards the mind. Health in respect to the former, and peace in respect to the latter, are the fruits we hope to gather under the name of happiness. Temperance is wanted to promote health—virtue is wanted to promote peace. The one it is not always within our power to attain or preserve; and when this is the case, the equality of the dealings of Providence with its creatures never fails to grant some preponderating benefit elsewhere in the lot. But to be virtuous is within the compass of our capabilities; for it is the thing *wanted*, and absolutely indispensable to happiness. A man may have plenty of money, and be able to enjoy a certain degree of sensual gratification, and he may also, in a very high degree, realise your wish of possessing such claims to distinction and admiration as shall insure him the applause and favour of the world; but unless he meets with the secret, calm approval of 'the still small voice' in his own conscience, he has not understood, or attempted to satisfy, the greatest of his wants, and must be, in point of fact and reality, a needy and most unhappy person. He has indulged his wishes at the expense of his necessities. It was not necessary for him to enjoy vain and sensual pleasures: it *was* necessary for him to be happy. It was not essential to happiness that he should be distinguished and admired for his talents: it was so that he should be respected and beloved; and he could not be either without being honest, truthful, kind, simple-hearted—in a word, a man of principle. The thief who goes to transportation, and the murderer who goes to the gallows; the intoxicated vagabond who is put into the station-house to grow sober, and, when sobered, is handed up to the mansion-house to hear and see his degradation proclaimed to the world; the defrauder, who stands there also, a living testimony of the fatal consequences of setting up his wishes as his guides and masters—what, think you, is the language of all their secret cogitations in those painful moments of sure and certain retribution? Do not the *want* and the *wish* meet then in one and the same thing? Are not the deep unuttered words of the heart and conscience, 'Oh how I wish that I had not done this thing!' a desire which, when interpreted into its legitimate meaning, implies, 'Oh that I had been contented to mind and gratify only my *wants*, and had not thus become the tool and fool of my ignorant wishes!'

The sum and substance of the whole of the matter is this, that happiness consists in peace of mind; and that peace of mind is only to be found in a state of equilibrium—a *nicely-poised* interior. All sorts of wishing have a tendency to destroy this valuable condition, because every wish has somewhat of the nature of the magnet in it; and unless balanced by a real legitimate *want*, will be sure to draw the mind from its centre. You wish for money; you wish to be distinguished; but how much of this wishing is balanced by a want? Just as much as this—you want money enough for your support, and for your necessary and lawful recrea-

tions; you want to be known and distinguished by those with whom you are connected, and with whom, in the circumstances of life, you may be called upon to deal as an honest person; as one whose word is his bond, and who has never to be searched for in holes and corners where the light of truth never enters. These are plain, lawful, intelligible wants, to which the most fervent and active wishes may be safely linked. But overstep these limits, and launch your bark upon the wide, and fathomless, and troubled ocean of your will—to which, at every period of life, the nurse's answer to the fractious child, 'You know not what you would have,' is most appropriate—and vainly will you ever try again to anchor your spirit in any safe harbour of rest.

THE CHINESE MIRAGE.

The word mirage is usually applied to natural scenery, and expresses that interesting effect of atmospherical refraction which sometimes covers a plain with a lake, in whose bosom are seen the reflection of trees and houses, and sometimes piles up towers and domes in the midst of a wilderness. Misled by the illusion, the weary and thirsty traveller of the desert pants in vain after the fairy waters, or seeks the shelter of those palace walls: the lake retreats as he approaches—the pinnacles sink before his eyes, and the buildings crumble and disappear.

In some countries a *moral* mirage is presented, quite as strange to the imagination, and perplexing to the judgment; and of such countries China may perhaps be cited as the most striking. Objects there are not only different to different observers—they are sometimes absolutely inverted; and what is still more extraordinary, some persons assure us that they have actually drunk of the waters, and leant against the walls, which others know, of their own personal knowledge, to be as unsubstantial as those of the Fata Morgana. The last reporter is Mr Meadows,* who founds his claims to our trust upon his knowledge of the language; and this, assuredly, is a great advantage, although, in our opinion, he plumes himself a little too much upon it. Shut up in an office, translating papers, and going through the other details of consular business, a mere knowledge of the language could hardly enable him, one would think, to decide magisterially upon the conflicting accounts we have received of a population of between three and four hundred millions. Still, we should not have thought it necessary to say anything about the natural exaggeration he has fallen into on the subject, were it not for a mistake into which it has led him, that may be worth pointing out, inasmuch as it is a very common one with travellers. He conceives 'that no man is entitled to write upon a foreign people unless he possess a practical knowledge of their language. Without this knowledge, it is next to impossible that he should write anything original about them. He may collect information from those that do know the language, and he may adopt their opinions, but he cannot form them for himself; or if he does risk it, they can scarcely have other foundation than his own imagination.'

Mr Meadows, then, supposes that each traveller who understands the language must entirely supersede his predecessors; for almost all travellers differ from each other, and it is impossible they can all be right. As for those laborious persons who compare such conflicting testimony at home, and form their opinions from the sifted evidence, they are not worth attending to, because they do not understand the language! But travellers, whatever Mr Meadows may think, are mere collectors of materials for historians and compilers; and

* Desultory Notes on the Government and People of China, and on the Chinese Language; illustrated with a Sketch of the Province of Kwang-Tung, showing its Division into Departments and Districts. By Thomas Taylor Meadows, Interpreter to Her Britannic Majesty's Consulate at Canton. London: Allen. 1847.

he, like the rest of his brethren, must submit his lucubrations to the critics, who will conceive that reading and reflection, undisturbed by personal feelings, entitle them to form an opinion.

Among the interesting subjects discussed in the volume before us, is that of population. 'It would seem,' says the author, 'that people now, when they hear of a country containing 360,000,000 of inhabitants—the population generally attributed to China—fancy, somehow, that this immense collection of human beings is crammed into a territory not greater than that of France or Austria, and that, consequently, the density of the population must be quite excessive. But the truth is, that China proper, containing, as is well known, about 1,300,000 square miles, would have, with its 360,000,000 of inhabitants, only 277 souls to the square mile, and thus be somewhat less densely populated than England; which latter country has, according to the census of 1841, about 297 souls to the square mile. Now, over all China husbandry is carried to considerable perfection; over a great part of it two crops of rice may be had annually; the body of its people are industrious and economical; but at the same time all, even those who can barely afford to feed a wife, marry young, all being exceedingly anxious to have children. Such being the case, why should its population remain stationary at a less degree of density than that of England?' The reason he has himself given—that the land is fully cultivated. The Chinese appear to extract as much subsistence from the soil as their state of knowledge renders practicable; and they are not only 'industrious and economical,' but parsimonious and omnivorous in the widest meaning of the word. The population remains stationary within the country, simply because the table is full; but an excess is born, and is drifted away every year in emigration, in defiance of law and ancient custom. In comparing China with England, as regards this subject, Mr Meadows forgets that the latter country is the workshop of the world, and that men are there in great demand; whereas in the former, which has no foreign trade worth talking of, all must be supported by the productions of the soil. If the population of England received as few supplies from abroad as that of China, the difference in numbers would very soon be quite the other way.

The 'cause of the long duration of the Chinese empire' is another mirage of our author. It 'is solely and altogether owing,' says he, 'to the operation of a principle, which the policy of every successive dynasty has practically maintained in a greater or less degree; namely, that good government consists in the advancement of men of talent and merit only to the rank and power conferred by official posts.'

'The existence of a system of examinations, based on this principle, is well known to every educated European; and it is literally impossible to conceive that the various writers on China, from the Jesuit missionaries who lived upwards of one hundred and fifty years ago, to the sinologues of the present day, can have failed to perceive the effects of this institution—effects so obvious, and so distinctly pointed out by Chinese writers, as to require no penetration to discover them. Yet, strange to say, all those whose works I have been enabled to peruse, seem to attribute the long duration and stability of the Chinese empire chiefly to the influence of the doctrine of filial piety, as inculcated by the Chinese sages. Now this doctrine, I maintain, does nothing as a *fundamental* cause to uphold the unity and stability of the Chinese empire; its influence, great though it undoubtedly be, could not of itself resist the existing causes of dismemberment for a single generation; and even for that influence—for all that is peculiar in the practical hold it possesses on the minds of the Chinese people—it is indebted to the principle referred to above as the sole cause of the long duration of the empire.'

His foundation for this opinion is partly 'a conversation' between two of the pattern emperors, who, we

beg leave to inform him, flourished at the epoch of the Mosaic deluge! It also rests upon a speech addressed to Ching-tang, not very far from two thousand years before the Christian era, commending him for bestowing poets only upon the virtuous; the said Ching-tang, as we read in history, being accustomed to amuse himself with making people walk over a narrow bar of iron, slippery with grease, and spanning an immense fire. Various appeals are made to other documents of the kind—all showing an unconquerable addiction to belief in the Chinese mirage.

Of some two dozen dynasties, commencing with authentic history, there is hardly one that did not begin and end in blood and usurpation. The dynasty usually set out with something like energy; but, by degrees, succeeding princes gave themselves up both to the weakness and tyranny that distinguished the worst of the Roman emperors; till at length, when the measure was full, when the country could endure no more, a usurper seated himself, with hardly an effort, on the throne; and the people, thankful for any change, bowed their heads in abject submission as before. The very same course was run by the first Tartar dynasty; and now the second has reached that period of imbecility which shows that its end, in the natural course of things, is at hand. There is no country mentioned in history to which the doctrine of Mr Meadows is less applicable than China, although this is not the place for an examination of such a subject in the length it would demand. For the present, we would merely note, that after every political convulsion, the people returned, as of one accord, to their habitual submission; to their worship at the tombs of their ancestors; to their reverence for their parents, and respect for superiors and magistrates; and to the rendering of divine honours to the emperor for the time being, even if an illegitimate or an alien.

In other matters of less importance, Mr Meadows' contributions to our knowledge of China are extremely welcome; and the following, for instance, on the subject of fashion, is both new and curious:—'The Chinese dress—to descend to minor topics—is generally supposed to be quite unchangeable, and the Chinese tailors a kind of stereotype clothiers. Now, it is true that the Chinese (I speak of the middle and higher classes) always wear long gowns when they go out, just as we wear coats; but as every part of our coats, and our other garments, are constantly being subjected to all kinds of changes, within certain limits, so the length of the Chinese gown, the size and form of its sleeves, its colour, and the kind of flowers worked in it when of silk, &c. &c. are perpetually varying. The same is the case with the Chinese shoes and winter scull-caps: the former are, within certain limits, at one period thick, and at another thin-soled; and the latter are at one time shallow, and at another deep; while the silk knob on the top is sometimes small, at others large, &c. &c. In China, in short, we find as many fops as in Europe, who, like their brethren of the West, are so thoroughly versed in matters of dress, that they can at a glance tell you whether a man's clothes be of the latest fashion or not.'

His information on the subject of the salaries of the Chinese officers may be placed in the like category. A mandarin's legal income is derived from salary and fees, but these items have a very little proportion to each other. 'For instance, one of those, in the receipt of about L.22 legal income, once complained feelingly to me about his poverty; and on my hinting that his post was, after all, not a bad one, he protested, with some earnestness, that his whole income did not exceed 7000 taels (L.2333), of which he had, he said, to give a great deal away. Now this old gentleman seemed to be one of those who complain on principle, and I am inclined to estimate his net income at upwards of 7000 taels; but his is one of the best of the lower posts.' A governor-general of a province receives L.60 salary, and L.8333 fees; and the fees of the other mandarins

are in proportion, not to their salary, but to their rank. But the illegal fees and extortions swell the income to something very handsome indeed. 'I have found it impossible to learn, with any degree of certainty, what the real incomes of the mandarins, as increased by illegal fees and special bribes, may amount to. They vary with the harvests, which, according as they are good or bad, render it easy or difficult to collect the land-tax—a proceeding in connection with which much extortion is carried on; they vary also with the number of lawsuits, and the wealth of the litigating parties; and lastly, they vary with the characters of the mandarins and their yemuns. The legal incomes of the lower mandarins are indeed so notoriously insufficient, that they have little hesitation in speaking, even to a foreigner, of their other gains in a general way; but they have many reasons for not entering into particulars. Hence, if you do contrive to learn what the gross income of any post is on an average, it is next to impossible to gain any idea of the net income—that is, of how much is left after all the higher mandarins have had their presents, &c. Under these circumstances, it is little better than a guess, when I assume the highest mandarins to get about ten times, the lowest about fifty times, the amount of their legal incomes.'

In a brief note on 'personating criminals,' we are informed that in the east of the province of Canton, 'a substitute may be procured to confess himself guilty of a felony, and suffer certain capital punishment, for about fifty taels of silver—a sum that would exchange here for about seventeen pounds sterling; and which, valued with reference to the amount of the necessities of life it would purchase in the department mentioned, is probably not worth more than one hundred pounds sterling in England.' This fact speaks eloquently of the gulf of starvation and despair in which a portion of the population of China are plunged.

Upon the whole, although Mr Meadows somewhat overrates his opportunities, he must be reckoned useful as a contributor of materials; and we would advise no compiler to sit down to a picture of the Chinese without a careful study of his 'Desultory Notes.'

THE PRIVILEGE OF MERCY.

On a bright September day in the year 1559, there entered the town of Vendôme a young prelate, mounted on a milk-white mule, which was shod with silver, and sumptuously caparisoned with scarlet trappings. The rider wore an ample red cloak, whose purple-fringed border well-nigh concealed the back of his ambling steed. His hat was also of scarlet hue, and from its crown floated two richly-twisted cords, each of which was ornamented with twenty-one purple tufts. These one-and-twenty tufts denoted the wearer's ecclesiastical dignity as cardinal and metropolitan, and perchance as patriarch also. Consequently, the inhabitants of the town crowded around him, and on bended knees besought his blessing, which he bestowed in the most orthodox and graceful manner, from side to side, as he slowly pursued his way.

He was a cardinal legate, and was travelling from his diocese of Amiens to his bishopric of Nantes. He had, according to the custom of the times, been provided with a patriarchate, a Syrian archbishopric, and five or six bishoprics. He was preceded by a cross-bearer, and followed by a physician, an exorcist, and a hundred archers, clad in livery. They were all mounted on mules, which ambled leisurely along, and if overtaken by a storm, the whole cavalcade (archers and mules included) took refuge in the nearest church. They neither dined, supped, nor slept anywhere except in religious houses; nor was it permitted them to abide longer than twenty-six hours in any one monastery; so that whenever their prescribed term of repose had expired, let the storm be ever so fierce, or the rain ever so violent, it stormed and rained upon the cardinal and his purple tufts.

On entering Vendôme, the cardinal proceeded towards the church of the Trinity, of which he was the commendatory abbot; and reaching the square in which it stood, he found the place thronged with a motley and tumultuous assemblage of people. There were stout and ruddy citizens, clad in many-coloured doublets, with their wives dressed in the finest Amboise cloth, and their infants rolled up like mummies, and their little girls bedizened à la mignonette. There were ragged scapegraces, and honest, well-patched vine-dressers, alongside of rich and well-clothed farmers. There were also smart girls, with embroidered collars and coquettish costume, mixed with farm-servants, whose unbleached aprons and coarse caps bespoke their poverty and toil. Nor must we omit certain varlets of the count, looking saucy and conceited; nor a groom of the countess, whose aspect was grave and sad (wherefore we shall hear by and by); while ever and anon there appeared at the notary's window two ancient ladies, gazing at the crowd. And truly a motley crowd it was!—a grave-digger and a juggler, lame horses and barking dogs, beggars and clowns, all gaping, as if in expectation of some earnestly-longed-for sight.

The scene lay in a square, three sides of which were skirted by Gothic houses with high-pointed roofs, whose gutters were of a curiously grotesque construction; and on the fourth side arose the stately church, with its portal adorned with delicate dentellated tracery. Near it stood a colossal tower, or rather a lofty steeple (built apart from the church), whose tall spire reached to the height of three hundred feet. On a level with the highest pinnacle, and apparently resting among the clouds, rose at a little distance behind the noble and saintly mountain of Vendôme, with its rocks, its pinnacles, its caverns, and its bushes of trailing vine; the crown of the hill being occupied by a huge and impregnable castle.

The cross-bearer having learnt the cause of the tumult, acquainted the legate that a gentleman of the province had been condemned to death by the Count of Vendôme, from whose castle-dungeon he was about to be conducted to the great entrance of the church, there to make a public confession of his crime. On hearing this, the prelate sprang from off his mule, and ascended the scaffold which had been prepared for the prisoner, and which was raised a little above the level of the square. Let us pause a moment to observe how eagerly this cardinal-archbishop, this patriarch of twenty-six years, availed himself of the opportunity to assist an unknown criminal, and to absolve him in *articulo mortis*. This is but one instance among ten thousand which might be adduced, to prove the ignorance or the prejudice of those writers who maintain that sentiments of humanity and of Christian charity were then utterly extinct among the higher orders of the clergy.

To return to our story. After a few minutes' delay, the condemned gentleman was brought into the square by the men-at-arms of the Count of Vendôme (Louis de Bourbon la Marche), and they were not less surprised than was their unhappy captive, on perceiving the double cross of the cardinal (a Basilican cross, having eight points), with the hundred archers of his guard stationed around the scaffold, upon which was seated a prince of the church, wearing his scarlet hat.

'Most eminent lord,' said the captive gentleman, who was a young man of graceful, yet resolute aspect, 'I thank our gracious God, your Lord and mine, that your paternity is here to receive my dying confession; the count having abused his power so far, as to restrain his almoners and chaplains from approaching me, until the present ceremony should be concluded; desiring to force me to declare myself guilty, and not me only.—But this is not a matter to be named in public!—Thus much only will I say, that there is no particle of truth in the charge laid against me by the count. I protest,' continued he, stretching out his hand towards the church—'I protest, in the presence of the Trinity, that I am innocent; and never will I make the confession

which is required of me. Now, most reverend father in God, be pleased to incline your ear to me, and to bless me before I die. With all humility, I beseech you to grant me this favour'—the young man hesitated, however, to kneel—'for I am a knight, and of noble parentage,' said he, looking irresolutely on the ground.

'It is true,' said the Vendôme jailor—'it is true!' 'It is true!' re-echoed the multitude; and the cardinal, observing that he wore the collar of the order of Anjou, spread out one end of his mantle on the scaffold, that the youthful knight might bend his knees upon it.

There was a solemn stillness among the crowd while the sacramental confession and absolution were given and received. Then followed a low dialogue between the confessor and his penitent, wherein the animated and impassioned gestures of the latter seemed ill to agree with the posture he had just quitted. It was evident, from the strong affirmations which were occasionally expressed on his countenance, that he was closely and scrupulously questioned by the prelate, who remained calm and unmoved. At length the cardinal rose up, and the people fell upon their knees.

'Citizens of Vendôme, and you other good people of the country,' said he, in blessing the multitude, 'after having invoked the aid of Him who disposeth the heart of the strong to commiseration, and who guideth the weak into the paths of submission and peace; of Him who planteth the cedar in inaccessible places, and soweth the valleys with flowers; who feedeth the lion and the eagle, as well as the lamb and the dove; we, Antony de Créquy, cardinal-presbyter of the holy Roman Church, tituli Beate Maria Supra Minerva et cætera et cæterorum, declare unto you, and swear upon the holy Gospels which we hold in our hand, that it is only through fortuitous circumstances, and by unforeseen chance, *sine provisione nec voluntate nostrâ*, that we have arrived in this city at the place and hour of this gentleman's execution; and that we have resolved to discharge, and fully to liberate, the said gentleman and knight, Messire Bienheure de Musset, from the capital punishment to which he has been condemned: making known unto you, that this our will and pleasure is signified in virtue of our right and privilege as cardinal of the holy Roman Church, which right belongeth unto us, according to the ancient and modern usage of this most Christian kingdom of France. And this same we now signify unto you, oh Louis de Bourbon, Count of Marche and Vendôme, through your officers who are here present; and we say unto you, High and mighty lord! deign to let your proud glances rest upon us from the fastnesses of your lofty towers; listen to the prayers of your people, and of us, whose voice is apostolical. Your mountain and castle of St Georges was of yore a Tabor for devotion, and a Parnassus for the Muses; we beseech you not to make it a Lyban for solitude, and a Caucasus for affliction! Return, ye citizens of Vendôme, to your homes in peace, and pray the God of all mercy to fill both you and us with his grace and heavenly benediction.'

'Amen!—amen!' replied a thousand voices. The archers of Créquy formed themselves into a line from the scaffold to the door of the church, where the liberated knight was admitted with the cardinal; and the good people dispersed, crying out, 'Noël!' while the men-at-arms returned precipitately to the castle, to acquaint their lord with what had taken place.

The fortunate Bienheure accompanied his deliverer to Nantes, where, some years later, he married a daughter of the house of Illiers; and their descendants still exist in the Vendômais.

The Count of Vendôme had condemned the knight from an unfounded suspicion of his attachment to the countess, who, says an ancient chronicler, was the most noble and virtuous princess of her time. The count was

so enraged at the Cardinal de Créquy for having liberated his foe, that he instituted a suit against him, which lasted beyond the count's lifetime, and was decided, after his death, in favour of the cardinal. The reconciliation of the two families was cemented by the marriage of Anne de Bourbon Vendôme with Clodino de Créquy, Lord of Heymont, &c.

Before concluding this article, we may observe that the last ecclesiastic who attempted to use the privilege of mercy was the Cardinal de Bourcier; but his claim was disallowed, because he refused to swear that he found himself *by chance* in the street Aux Ours in Paris, when a criminal convicted of sacrilege passed through it on his way to the place of execution. It was a privilege which was most obnoxious both to the kings of France and their parliaments, as they considered it too exorbitant a right for any subject to possess.

THE BURIED TOWN OF PLEURS.

A spot which was to me one of the most interesting in all my rambles, was where the village of Pleurs, with about twenty-five hundred inhabitants, was overwhelmed, in the year 1618, by the falling of a mountain. This terrific avalanche took place in the night, and was so sudden, complete, and overwhelming, that not only every soul perished, but no trace whatever of the village, or of any of the remains of the inhabitants, could afterwards be discovered. The mountain must have buried the town to the depth of several hundred feet. Though the all-veiling gentleness of nature has covered both the mountain that stood and that which fell with luxuriant vegetation, and even a forest of chestnuts has grown amidst the wilderness of the rocks, yet the vastness and the wreck of the avalanche are clearly distinguishable. Enormous angular blocks of rocks are strewn and piled in the wildest confusion possible, some of them being at least sixty feet high. The soil has so accumulated in the space of two hundred years, that on the surface of these ruins there are smooth, grassy fields at intervals, and the chestnuts grow everywhere. A few clusters of miserable hamlets, like Indians' or gipsies' wigwags, are also scattered over the grave of the former village; and there is a forlorn-looking chapel that might serve as a convent for banditti. The mountains rise on either side to a great height in most picturesque peaks and outlines, and the valley is filled up with a snowy range at the north. It was a solemn thing to stand upon the tomb of twenty-five hundred beings, all sepulchred alive! No efforts have ever discovered a trace of the inhabitants—not a bone, not a vestige. It was the Mount Conto that fell; the half that was left behind still rises abrupt and perpendicular over the mighty grave. It is singular enough that the town was situated itself on the tomb of another village, which had previously been overwhelmed by a similar catastrophe. For that reason it was named Pleurs—The Town of Tears. From the times of old, as often as in Italy one city has been buried, another has been built upon the very same spot, except, indeed, in the case of Pompeii, so that it is no uncommon thing for the same earth to be leased to the dead and the living. The Town of Tears was one of the gayest, richest, laughing, pleasure-loving, joyous little cities in the kingdom. It might have been named Tears, because it had laughed till it cried. It had palaces and villas of rich gentlemen and nobles; for its lovely and romantic situation, and pleasant air, attracted the wealthy families to spend, especially the summer months, in so delightful a retreat. I wonder that no poet or romance writer has made this scene the subject of a thrilling story. The day before the lid of their vast sepulchre fell, the people were as happy and secure as those of Pompeii the night of the Vesuvian eruption—and much more innocent. There had been great rains. Vast masses of gravel were loosened from the mountains, and overwhelmed some rich vineyards. The herdsmen came hurrying in, to give notice that strange movements had been taking place, with alarming symptoms of some great convulsion; that there were great fissures and rents forming in the mountain, and masses of rock falling, just as the cornice of a building might topple down in fragments before the whole wall tumbled. Nevertheless, there was no dream of what was to follow. The storm cleared brightly away; the sun rose and set on the 4th of September as a bridegroom; the people lay down securely to rest, or pur-

* A contraction of Emanuel, 'God with us,' used by the French as a cry of joy and approbation, resembling the modern *Vive!*

sued their accustomed festivities into the bosom of the night, with the plans for to-morrow; but that night the mountain fell, and destroyed them all. At midnight a great roar was heard far over the country, and a shock felt as of an earthquake, and then a solemn stillness followed; in the morning a cloud of dust and vapour hung over the valley, and the bed of the Maira was dry. The river had been stopped by the falling of the mountain across its channel, and the town of Pleurs, with the village of Celano, had disappeared for ever. All the excavations of all the labourers that could be collected failed to discover a single vestige of the inhabitants or of their dwelling-places. The miners could not reach the cathedral for its gold and jewels; and there they lie at rest, churches and palaces, villas and hovels, priests, peasants, and nobles, where neither gold, nor love, nor superstition, nor piety, can raise them from their graves, or have any power over them.—*Cheever's Pilgrim of the Jungfrau.*

HOOK'S HOAXES.

Hook called, and in the course of conversation gave me an account of his going to Lord Melville's trial with a friend. They went early, and were engaged in conversation when the peers began to enter. At this moment a country-looking lady, whom he afterwards found to be a resident at Rye, in Sussex, touched his arm, and said, 'I beg your pardon, sir, but pray who are those gentlemen in red coming in?' 'Those, ma'am,' returned Theodore, 'are the barons of England; in these cases the junior peers always come first.' 'Thank you, sir—much obliged to you. Louisa, my dear (turning to a girl about fourteen), tell Jane (about ten) those are the barons of England; and the juniors (that is the youngest, you know) always go first. Tell her to be sure and remember that when we get home.' 'Dear me, ma!' said Louisa, 'can that gentleman be one of the *youngest*? I am sure he looks very old.' Human nature, added Hook, could not stand this; any one, though with no more mischief in him than a dove, must have been excited to a hoax. 'And pray, sir,' continued the lady, 'what gentlemen are these?' pointing to the bishops, who came next in order, in the dress which they wear on state occasions—namely, the rochet and lawn sleeves over their doctor's robes. 'Gentlemen, madam!' said Hook; 'these are not gentlemen: these are ladies, elderly ladies—dowager peeresses in their own right.' The fair inquirer fixed a penetrating glance upon his countenance, saying, as plainly as an eye can say, 'Are you quizzing me or no?' Not a muscle moved; till at last, tolerably well satisfied with her scrutiny, she turned round and whispered, 'Louisa, dear, the gentleman says that these are elderly ladies, and dowager peeresses in their own right; tell Jane not to forget that.' All went on smoothly, till the speaker of the House of Commons attracted her attention by the rich embroidery of his robes. 'Pray, sir,' said she, 'and who is that fine-looking person opposite?' 'That, madam,' was the answer, 'is Cardinal Wolsey!' 'No, sir,' cried the lady, drawing herself up, and casting at her informant a look of angry disdain, 'we know a little better than that; Cardinal Wolsey has been dead many a good year.' 'No such thing, my dear madam, I assure you,' replied Hook, with a gravity that must have been almost preternatural; 'it has been, I know, so reported in the country, but without the least foundation; in fact those rascally newspapers will say anything.' The good old gentlewoman appeared thunderstruck, opened her eyes to their full extent, and gasped like a dying carp; *vox faucibus hæsit*, seizing a daughter with each hand, she hurried, without a word, from the spot.—*Third Series of the Ingoldsby Legends.*

EFFECT OF MINUTE SUBDIVISIONS OF LAND.

The possessions of the inhabitants of the village of Cros-ville, in the department de l'Eure, are very diminutive, the soil being divided into extremely small parcels, and the lands around the village belonging to the inhabitants of Neubourg, by whom they are cultivated. Thus beggary, which in the beginning was the resource only of the most wretched, has become the common occupation of the place. They form at this time a sort of mendicant republic, living after the fashion of gipsies, except that each one has his own hut. Marriage has no existence among them; and whoever violates these customs by marrying, is *passé par les bâtons*, or cudgelled, as a punishment for his infidelity. They are sensible that marriage attaches the individual to his home, and that a vagrant life is necessarily one of debauch.

THE GOLDEN ROSE.

[In ancient Germany it was the custom for a bridegroom to send or bring to his betrothed a golden rose, as a token that he was about to claim her.]

'Sister, wake! 'tis surely morning; listen, I can hear the bees humming underneath the window, in the fragrant lilac-trees. There it comes! that wandering sunbeam I have watched so many a time, creeping in the same dark corner at the early morning ohime.

'Oh the night is very weary unto those who lie and moan, And who only know the daytime by the slow hours stealing on— By the small blue rift of heaven gleaming through the curtained pane, By the warbling birds that waken to their daily life again.

'Sister, rise! and let me watch you twisting up your tresses bright: Stand there, just where I can see you, in the early morning light. I will look, and you shall listen, while I tell a wondrous dream Which I dreamt, when these tired eyelids closed at daybreak's cold gray beam.

'Often have I, sighing, told you, how to me there came no more Those sweet dreams that used to haunt me in the first, sad time of yore, When this long and wasting sickness, stealing all my youth and bloom, Turned my eyes from bridal altar to the dark and ghastly tomb.

'It is long since even in alumber I have seen my Wilhelm's face, But last night he looked upon me from his blessed dwelling-place: Not as when I last beheld him—still, and cold, and marble-white— But all radiant as an angel, with his gold hair gleaming bright.

'And he kissed my lips and forehead, as in those dear olden days, And his eyes once more bent on me their clear, loving, earnest gaze: Not a word did Wilhelm utter; and my lips, in silence bound By that holy kiss he gave me, could not frame a single sound.

'Then he placed within my bosom, with a smile, the rose of gold; And my heart leaped up within me as I felt his dear arms fold Round me; and a wondrous lightness shot through all this drooping frame, While above my shoulders budded two bright wings of amber flame.

'In the air we rose together, I and Wilhelm, hand in hand; Like two wandering doves we floated over sea and over land; Higher—till the air grew clearer, and the earth beneath grew dim, And afar we heard the angels chant our glorious nuptial hymn.

'In each other's arms we floated all the blessed stars among, Till I awakened with the music of the skylark's matin song. Sister! tell me now what meaneth this most happy dream of mine?' Weeping, turned away the sister, for too well she knew the sign.

On the wall the sunbeam stealths; gaily hum the laden bees; And the light wind stirs the blossoms in the fragrant lilac-trees; Loudly sings the lark, but breaks not that immovable repose, For the bride has met the bridegroom—Death has brought the golden rose.

D. M. M.

FOSSIL SEA-SERPENT.

If naturalists are still undecided as to the living reality of the 'kraken,' or gigantic sea-serpent, there can now be no doubt in regard to its existence in former ages, or at least the existence of an opifidian animal of equally enormous dimensions. Dr Koch, who brought to this country the Missouri mammoth, exhibited in the Egyptian Hall, and now in the British Museum, has also discovered the fossil remains of a serpent of immense size, which he calls the *hydrarchos*, or monarch of the waters. It is said to possess a vast number of very large vertebrae, and is the most extraordinary specimen of the so-called antediluvian creation extant. It has been exhibited at Berlin, where it is likely to remain, the king having given orders for its purchase, notwithstanding the large price required by the exhibitor.

PRICE 1½d.

THE POSSIBLE.

A CURIOUS pamphlet, entitled *Historic Doubts Relative to Napoleon Bonaparte*, appeared about thirty years ago, and attracted some attention on account of the strange line of argument adopted by the author. To those who never read or heard of the work, it will seem hardly credible that a serious attempt was made in it to show that we had no proof of even the existence of such a man as Napoleon, though he was then understood to be living in St Helena, scarcely past the prime of life. Apparently the idea amused the public, for the copy before us is of the *fourth* edition, published in 1831; yet it is probable that comparatively few persons, after all, have seen this singular production.

The author starts with a summary of the wonderful acts imputed to Napoleon, but remarks, that in the details of his life there has been almost every conceivable variety of statement; his motives a subject of doubt, and even his military skill denied. In the midst of the controversy, the preliminary question of his *existence* seems never to have occurred to any one as a matter of doubt; that, apparently, has been always taken for granted. But it is found that fallacy most generally attends *undisputed points*; for example, the case of the live fish suggested to the Royal Society by King Charles II.—or the following:—‘It was objected to the system of Copernicus when first brought forward, that if the earth turned on its axis as he represented, a stone dropped from the summit of a tower would not fall at the foot of it, but at a great distance to the west; in the same manner as a stone dropped from the mast-head of a ship in full sail, does not fall at the foot of the mast, but towards the stern. To this it was answered, that a stone being a part of the earth, obeys the same laws, and moves with it; whereas it is no part of the ship, of which, consequently, its motion is independent. This solution was admitted by some, but opposed by others; and the controversy went on with spirit; nor was it till one hundred years after the death of Copernicus that, the experiment being tried, it was ascertained that the stone thus dropped from the head of the mast, *does* fall at the foot of it!’

It is also to be observed that there is a disposition to believe in marvellous stories upon insufficient evidence.

It may be said that the existence of Napoleon is notorious; that is, it is much talked about. But then the great bulk of those who talk of Napoleon merely repeat what they have heard others say; they do not speak from their own knowledge. Some may profess to have personally known the man. ‘I write not,’ says the author, ‘for them:’ he only begs they will be ‘tolerant of their neighbours who have not the same means of ascertaining the truth.’

Any attempt to trace this hearsay evidence to its

source, soon brings us to the *newspapers*. ‘Generally speaking, it is on the testimony of the newspapers that men believe in the existence of Napoleon Bonaparte.’ The newspapers, whose impudent fabrications are so often spoken of by Englishmen with contempt! Let us examine this evidence. ‘First, what means have the editors of newspapers for gaining correct information?’ They copy from other newspapers, foreign or British—we know not whence such intelligence comes. Or they refer to private correspondents. Who these are, what opportunities they have of obtaining information, or whether they exist at all, we have no means of knowing. Then the editors of newspapers have an obvious interest in circulating wonderful stories about Napoleon, because it causes their journals to be in demand. It may be said that their party hatreds would prompt them to expose each other’s fabrications. Yes; but in doing so, each would expose his own. The political parties represented by the newspapers have a common interest in keeping up the name and acts of Napoleon before the world; for, both being anxious for power—that is, for the disposal of the taxes—both are glad to have him as a bugbear to compel the payment of these imposts. It is not necessary to suppose them in a universal league for maintaining a falsehood; ‘most likely, the great majority of them publish what they find in other papers, with the same simplicity that their readers peruse it.’

On the supposition, however, of there being no preconcerted plan for imposing on the public, there ought to be great discrepancies in the accounts. Well, there are. Even the great and leading transactions are represented differently. ‘For instance, it is by no means agreed whether Bonaparte led in person the celebrated charge over the bridge of Lodi (for celebrated it certainly is, as well as the siege of Troy, whether either event ever really took place or no), or was safe in the rear, while Augereau performed the exploit. The same doubt hangs over the charge of the French cavalry at Waterloo. It is no less uncertain whether or no this strange personage poisoned in Egypt an hospitalful of his own soldiers, and butchered in cold blood a garrison that had surrendered. But not to multiply instances: the battle of Borodino, which is represented as one of the greatest ever fought, is unequivocally claimed as a victory by both parties; nor is the question decided at this day. We have official accounts on both sides, circumstantially detailed, in the names of supposed respectable persons, professing to have been present on the spot, yet totally irreconcilable. Both these accounts may be false; but since one of them must be false, that one (it is no matter which we suppose) proves incontrovertibly this important maxim:—that it is possible for a narrative—however circumstantial—however steadily maintained—however public, and

however important the events it relates—however grave the authority on which it is published—to be nevertheless an entire fabrication!

It must be difficult, the author admits, for the public to think it possible that it can have been deceived so long. Yet we know how larger publics than ours have been deceived about Brahma and Mahomet for a much longer time. To show how, even in this enlightened age, as it is called, a whole nation may be imposed upon, the author relates the following anecdote:—‘It was stated in the newspapers, that a month after the battle of Trafalgar, an English officer, who had been a prisoner of war, and was exchanged, returned to this country from France, and beginning to condole with his countrymen on the terrible defeat they had sustained, was infinitely astonished to learn that the battle of Trafalgar was a splendid victory: he had been assured, he said, that in that battle the English had been totally defeated; and the French were fully and universally persuaded that such was the fact. Now, if this report of the belief of the French nation was not true, the British public were completely imposed upon; if it *were* true, then both nations were at the same time rejoicing in the event of the same battle, as a signal victory to themselves; and consequently one or other at least of these nations must have been the dupes of their government: for if the battle was never fought at all, or was not decisive on either side, in that case *both* parties were deceived. This instance, I conceive, is absolutely demonstrative of the point in question.’

But then many people saw Bonaparte at Plymouth ‘with their own eyes.’ All respect to both the eyesight and the veracity of those individuals; ‘they saw a man in a cocked hat, who, *they were told*, was Bonaparte.’ How could they know that it was really he? How many people have told impossible things, alleging they have seen them with their own eyes! Soldiers may come forward, in like manner, and show the scars they received in fighting against Napoleon’s armies. ‘But,’ says our author, ‘I defy any one to declare, on his own knowledge, what was the cause in which he fought—under whose commands the opposed generals acted—and whether the person who issued those commands did really perform the mighty achievements we are told of.’

What, above all, throws doubt upon the truth of the stories told of Napoleon, is their wonderful nature. ‘All the events are great, and splendid, and marvellous; great armies, great victories, great frosts, great reverses, “hairbreadth escapes,” empires subverted in a few days; everything happening in defiance of political calculations, and in opposition to the *experience* of past times; everything upon that grand scale so common in epic poetry, so rare in real life; and thus calculated to strike the imagination of the vulgar, and to remind the sober-thinking few of the Arabian Nights.’ He loses five armies to France, yet ‘so eager are the French to be a sixth time led to destruction, that it was found necessary to confine *him* in an island some thousand miles off, and to quarter foreign troops upon *them*, lest they should make an insurrection in his favour. To enumerate the improbabilities of each of the several parts of this history, would fill volumes. . . . Let any man, not ignorant of history and of human nature, revolve them in his mind, and consider how far they are conformable to experience, our best and only sure guide. In vain will he seek for something similar to this wonderful Bonaparte.’

The reader is probably by this time prepared to learn that the whole of this odd argument was the production of a learned and ingenious divine—the present archbishop of Dublin—designed to meet the doctrine of a philosopher of the last century—that we ought not to believe any narration of extraordinary events, if they exceed our experience and observation of the world, as in that case an error of the reporters is much more credible. Here is a history transcending all experience and observation, and against the actuality of which

a great deal can be urged, and yet we all believe in it. What, then, becomes of the much-vaunted test, that the allegations should be more probable in their nature than the unfaithfulness or simplicity of the witnesses?

The whole thing is surprisingly clever and telling; and no one would have been more ready to own so much, and to enter into and enjoy the joke, than the very philosopher whom it throws into ridicule. It is not for us to discuss more particularly the bearing of the argument upon religious questions; but we feel inclined to trace its relation to our common proceedings regarding evidence.

It is not, we think, to be denied, that there is a natural disposition to weigh probabilities in the way which the philosopher pointed out: that is, when we hear anything wonderful told, we are extremely apt to disbelieve it, if it seems more likely that the narrator has been deceived, or aims at deceiving, than that the alleged facts should have taken place. But this is not always necessarily to be regarded as an instinct leading us to the best means of ascertaining truth or avoiding error, and guiding us with regard to human testimony. It may be only the exponent of a certain indifference and levelness of understanding, which will rather be content with the rejection of novel intelligence at all hazards, than disturbed with new ideas, or at the trouble to ascertain their soundness. Or it may be to some extent a mere habit, induced in the majority by the impossibility they find of sifting all marvels that come before them. Life being too short to allow of this sifting in all cases, we are obliged, in most instances, to make a choice between rejection or credulity, and being determined against the latter, we have no alternative but to disbelieve.

Mr Burton, in his life of Hume, has remarked the accordance of the doctrine with the character of its author’s mind. ‘How clearly,’ he says, ‘do we find these principles practically illustrated in his history! A disinclination to believe in the narratives of great and remarkable deeds, proceeding from peculiar impulses: a propensity, when the evidence adduced in their favour cannot be rebutted, to treat these peculiarities rather as diseases of the mind than as the operation of noble aspirations: a disposition to find all men pretty much upon a par, and none in a marked manner better or worse than their neighbours: an inclination to doubt all authorities which tended to prove that the British people had any fundamental liberties not possessed by the French and other European nations. Such are the practical fruits of this necessitarian philosophy.’

If we were always to judge, moreover, by our experience, nothing beyond that experience would have any chance of being fairly treated. It would be setting up a narrow knowledge as a judge upon all knowledge beyond. Men would then be cautious in the proportion of their ignorance, which neither is a fact, nor is it a thing to be desired. Even men who pass as enlightened and knowing, would be unjust to many things, for all knowledge is but a point in the gradations of ignorance. And thus scientific men often are erroneously sceptical, as when they rejected the reports brought to them regarding meteoric stones, or when they (not long since) denied the possibility of severe surgical operations being performed painlessly. On this principle, there would be no progress in knowledge; for whenever an investigator brought out a new truth, he would be met with, ‘Pooh, pooh! Far more likely that you are deceived by your imagination, than that anything so different from common observation should be true.’

However convenient, then, it may be, in common life, to judge of probability in the way pointed out by the philosopher, it evidently becomes a fallacious test when we would try by it any extraordinary fact or series of events on which it is of importance for us to come to a full decision. And yet it will not do to admit everything merely because we cannot be sure how far it is irreconcilable with what we already have reason

for believing. In that case we should have no protection against the most ridiculous marvels which any ill-designing person might seek to impose upon us. No one certainly pretends to deny that there are degrees of credibility in authorities, and that human testimony can and ought in all cases to be weighed before it is received. Neither can it be doubted that there is a wise caution to be exercised with regard to the reception of novelties and marvels of all kinds, *that* being always the most liable to scruple which is most remote from systems and principles already in some degree of credit. The philosopher, the divine, the judge, all keep fully in view the different estimates to be put upon matters submitted to their judgment, according to these attendant considerations.

Perhaps the best practical point we can arrive at, is to exercise this judgment in the highest extent, but with greater liberality than is generally found towards what is beyond the range of existing knowledge. What seems most necessary to the philosophy of our age, is a larger view of the bounds of the Possible. We need such extensions of our conceptions of human nature and affairs, as the marvels of the Napoleonic era were calculated to give to the man living in the last century. We need such enlargements of our ideas as to physical nature, as the recent discoveries of Faraday are calculated to produce. We would require to take man and society, less as the narrow problem which they form in their more familiar aspects, and more in connection with the great unseen influences which preside over the world. Were this the case, the tone of the public mind would become less rigidly material, less coldly sceptical than it is. A vital, generous, and ever-aspiring faith would succeed, and the progress of our race would be proportionately advanced.

A SEA-PIECE.

SKETCHED IN A PASSENGER'S LOG-BOOK.

THE ship 'Maria,' Captain Roberts, of Bristol, had for the last ten days kept good hold of the north-east trade-wind, steering 'full and by,' or large before it; a few points off her course, indeed, but going all the while not less than ten knots an hour. Scarcely a yard had been touched during that time, and the crew had been occupied chiefly with odds and ends about the rigging, mending sails, making spars; not more than one watch being generally on deck at once under the mild régime of Captain Roberts. By the time he thought fit to keep the ship away to westward, we had already run down almost into the latitude of the West Indies; but a fortnight's sail of longitude remained still to make. At breakfast-time the starboard braces were taken in, the yards slanted sharp across, and a course given for the helmsman to steer, instead of the wind itself, as a direction to him.

The Maria leant at first briskly over in the morning breeze, which rushed against her with a plash of deep-blue waves, one of which would every now and then wash up through the bulwarks, and trickle in several streams down her sloping white quarter-deck into the lee-scuppers. Every change at sea is welcome, and this itself produced a difference in the appearance of things more lively than can be appreciated by a mere landsman. Up above the weather-taffrail you only saw now a narrow line of azure waters, closed by the yellow tacks of the sails hauled fast into the bulwark; while to leeward, all was spread out, fresh and rolling, in so far as ropes and canvas allowed. To windward, on the level of the horizon, which wore a strong, steady gush of colour from the breeze, could be perceived the faint shape of a large vessel, seen since daybreak; and when the ship rose on a wave, that distant speck seemed to grow clearer through a half-open port, which admitted the cool draught, with a keen blue glimpse of sea and air, over the muzzle of a carronade. Towards mid-day, however, the wind had not only shifted a little, but began to leave us: now and then the sails, which had

so long remained asleep before its constant force, shivered one above another, as if with a sudden convulsion, and then filled out again. The ship was kept away another point; the quarter-deck awning, as usual, was spread; and much was it needed; for at noon, when the captain came up with his sextant to take his observation, the hot breaths of air between the last puffs of the breeze smacked most unequivocally of the line. The free, regular movement of the sea was falling gradually into longer and slower undulation, that proceeded not from the atmosphere, but from the ocean itself, and was evidently the forerunner of a calm. Its colour, changed from strong, sprinkly blue, to pure opal, or that tint called by painters ultra-marine, had insensibly become most beautiful; and lying in that dazzling, cloudless sky like a heaving image of it, reflected every ray of the perpendicular sun upon the bosom of a broad and glassy swell, that lifted us without ever breaking. I looked over the side to notice the good Maria's present speed, and calculated she did not make three and a-half knots an hour, with allowance for the confusing motion of mingled swell and wave.

Notwithstanding all this tranquillity, the captain, who had accidentally consulted the barometer, ordered the crew 'to get their dinner over as sharp as possible.'

'Have you made that vessel out yet, sir?' continued he, taking up the telescope from under the capstan, and looking at the ship in the distance, which had grown more distinct.

'Nothing more,' I said, 'than her being a large three-master, with all sail set, and apparently before the wind.'

Even as I spoke, the dim figure of the far-off ship came out into strange vividness, so as to be almost startling, as if a sudden gleam of the most intense light had fallen upon it. It was, however, the gradually-deepened hue of the horizon, behind which had thus been expressed for a moment the number of her masts, and the very whiteness of her sails. The phenomenon became more striking, palpable, distinct; and then by degrees, as if a veil had been interposed, or she had sunk into a dusky film beyond, the ship ceased to be visible at all. On the place where she had disappeared—what a seaman would call the eye of the wind—there grew a dark-gray spot, that changed to indigo, and, like a leprous taint, was diffusing itself in the sky, and creeping along the horizon, till the whole sea-line to windward was of a deep livid black, relieved against a sullen neutral-tint, as if an unseen darkness were beneath. Still to leeward all was clear and bright, while the sun was hot as a furnace-breath overhead. All at once, again and again, the sails collapsed with a sound like the explosion of a carronade, and we were all aback, the vessel rolling helplessly on the long smooth swell; and then they were as suddenly distended as before. The mate, who had been standing by the compass, now stepped to Captain Roberts, and mentioned that the ship would not steer her course. 'Call the hands,' was the reply. 'All hands, there!' shouted the mate. 'Square away the yards,' said the captain; and in an instant all was pulling, hauling, and the creaking sound of the heavy yards swinging round in their iron pivots. I leant over the side, looking into the glassy blue water, which seemed to subside visibly to oily stillness, nothing being audible but the quick jerks and jolts of the almost useless wheel, by which the sailor under the round-house stood listlessly. A dim green form rose up out of the depths under my sight to the very ribs of the ship; and as I gazed down upon the hideous head of the monster, with its sharp back-fin actually clear of the surface, for the first time in many years I recognised a shark. The stillness and isolation, the breathless hush which pervaded the whole ship, with the hot, oppressive air, reminded me of the scene in Coleridge's 'Ancient Mariner,' which I had been reading lately, and I lifted my head, if only to verify my connection with human companions. I was at first surprised to see the sky and horizon before me again clear, and for an instant fancied

that the threatened tropical thunder-storm had passed as suddenly as it came, leaving only a shadowy trace upon the sea. It needed but the next moment's reflection, while in the act of looking round, to convince me that the vessel had simply shifted her position unawares during my meditation; although to a landsman it is curious, for the first time, when in a calm he sees himself opposite, all on a sudden, to some object on the contrary side of the horizon. It is impossible in any other way to realise so much the feeling of total helplessness, of dependence upon the free winds of heaven, as when, thousands of miles from land, you watch the compass which the steersman has left, and perceive the ship's headmark successively coincide with every point in the circle. The captain's voice, as it broke the silence, was absolutely startling.

'Man the fore and main clue-garnets; brail up the courses.'

'Ay, ay, sir!' And this slight renewal of activity fell cheerfully in. As the two broad sheets of lower canvas rose gradually up to the yard, however, they revealed the whole livid background, towards which the ship's head, with its white bowsprit and flapping stay-sails, was now directed. The short interval had served to extend it already into a huge bank of sullen vapour, that concentrated to cloud, obliterating the division of sea and sky, and seeming to steal near rather by the deepening of its gloom, and the spreading of its crescent-wings, than by actual motion. The brassy glare which smote upon its western edge from the sun gave to the sight a still and terrible beauty, out of which, next instant, one expected to see the lightning dazzle forth, and to have his hearing confounded by some insufferable trumpet-blast of thunder. Underneath and round, the whole ocean, so lately of the keenest blue, lay leaden-coloured and dull; heaving, as it were, from the other horizon into the obscure bosom of the thunder-cloud, with one long, faint, noiseless undulation, upon which a cork would not have dipped. The continued clearness of the opposite sky rendered it more striking; but what was most impressive about the scene, was the contrast presented by the occasional clank of the rudder-chains, and jerk of the wheel, to that utter stillness of the great spreading exhalation, surcharged with thunder, light, and rain, if not with tempest.

'Let go the royal and to-gallant halliards,' cried Captain Roberts; 'and you, boys, lay aloft and furl them. On deck there, stand by the topsail halliards. I expect we shall have more water than wind just now,' continued the captain, as he came aft to me under the round-house. For half an hour little more was said indeed—all standing at their posts, in no mood for conversation, which at sea people seldom are when anything important is in suspense. Meanwhile the gloom deepened, and the vast thunder-cloud appeared to climb, with its palpable top, up the vault of heaven, till it hung overhead, and projected far behind us. A muttering growl ran round at intervals in the distance, and the sea was calm as glass, and pale by contrast. At last there shot forth, as if from an abyss of darkness, one forked, dazzling, zig-zag flash, with which the very bosom of the cloud seemed for a moment to grow luridly transparent; and sails and masts appeared to quiver together at the explosion which burst above, like the breaking up of the firmament. Still all was hot, breathless, and without wind; the deck like heated iron, the pitch-seams sticking to the feet, and the vessel slowly making the circuit of her compass with the horizon, one side of which still lay hard and livid against a cloudless atmosphere. Flash followed flash, peal succeeded peal; and once a meteor-like ball of light appeared to crown the main sky-sail mast-head, and to play along the royal yard. At every flash one could see the faces of the men standing in groups, motionless and rigid, by the ropes where they had been stationed. Suddenly, from the edge of the cloud above us, with the hiss of a thousand cataracts, and a feeling as

if the vessel were at once submerged, there descended a sheet of rain so unbroken, so compact, that for the instant one gasped for breath. From side to side the whole ocean was one white, confused mass, ploughed up by the falling torrent, and faintly luminous as the fresh water mingled with the salt element, whose lazy, sullen swell meanwhile rose higher, in spite of the absolute calm. The deck itself was in a minute's space knee-deep with water, over and above what the scupper-holes could discharge; and at every slight roll of the vessel, ropes, buckets, and other incumbrances were washed about one's legs. For a whole hour did this uncomfortable state of things continue; the rain finally lessening, the gloom passing to leeward, and the sudden swell subsiding, till the sea lay even more dead-smooth and glassy than before, and the saturated canvas began to steam up under the heat. In the quarter whence the thunder-storm had come, was now spread a heavy blue haze, which, as it darkened, seemed to promise something more. This time, however, it was the wind. From under the foot of the ominous veil there moved towards us first a line of deep indigo, then a keen, kindling streak of white, that lengthened as it came, like dust beneath the wheels of innumerable chariots, accompanied by a far-off murmuring hum. A light puff blew the three tall topsails aback for a moment, and then as suddenly left them hanging vertically; and the yards were hauled a little round to meet it. Still all was calm near at hand, the rudder not even jerking, when all at once the smooth sea swelled up beside us, of an inky blackness, as if it would rise over the bulwarks, and swamp us bodily. As suddenly, responsive to the element beneath, the gallant little Maria rose high upon the huge unbroken undulation; and then, with a howl of fury, the squall caught her.

'Port, port!' shouted the captain; 'down with the helm!' and it was as much as the grizzled old seaman beside it could do, assisted by the mate, to grind round the wheel and meet the wind, as the ship unexpectedly found steerage-way, and her head-sails payed her off. She leant over with her larboard gunwale under water, and the yard-arms almost seeming to touch the wave-tops as they rose; while the force of the blast gave her scarcely time to rise, burying her head every now and then in a dark-green sea, that washed aft to where we stood. For the first few minutes all was confusion; ropes thrown down, the crew shouting as they hauled, and scrambling as well as they could into the weather-rigging to reef topsails. The whole scene, although fearful, was most spirit-stirring. I stood holding on by a backstay to windward, at peril of being drenched even on the quarter-deck, as the man at the wheel luffed a little to take the wind out of the sails for the reefers. It was thrilling to look up and see the men creep down to leeward on the yard, and push out the foot-rope as they leant to handle the belying canvas, stiffened with wind and rain; their blue and red shirts relieved against the wild, desolate sky, which had lately been shut out by the broad sails; and the half-seen faces of the old hard-a-weather sailors at the earings, looking white with stern, rude energy, as they turned them round. Behind there was nothing but a rising outline of tumultuous water, indigo-coloured, and a thick white mist beyond, from which the vessel fled, amidst the steady roar of the tempest, into the darkness that had left her in its rear. Cheerily, however, went the three diminished topsails up to their stretch; and the Maria, when kept away from the wind again, climbed the huge waves more easily, shaking the sea from her bows like a flashing-coble in a breeze.

Soon after this, the appearance of the weather had altered for the better. The wind had moderated to a breeze, and the reefs were shaken out of the topsails, and top-gallant sails set again, although there was still a heavy sea on. The Maria was now close to the wind, and leant steadily over as she ploughed the dark waves, while now and then over her weather-bows there burst a white cloud of spray. She was running right on into

the yellow light of sunset, which was visible low down between the troughs of the sea, and behind the blue line of the horizon as her white bowsprit lifted. In place of the late dark cloud to windward, lay a hazy bank of gray vapour, whose eastern wing slowly crept into the clear azure space of sky beyond. When we rose at intervals, I fancied I could discern on that open horizon to eastward the dim figure of a vessel in the distance—apparently the Indianman we had seen before the squall. Suddenly I perceived a keen point of silvery light kindle in the very centre of the spot, and the form of the ship seemed to be defined by it. Taken together with her appearance in the daytime before the squall, it at first recalled to me the legends of the 'Phantom Ship' and the 'Flying Dutchman,' which are current amongst sailors. The idea then occurred to me that the vessel was on fire, and I remarked it to Captain Roberts. Next time we rose, however, my mistake was discovered by the beautiful phenomenon before us. The large bright circle of the rising moon was half extended around the far-off ship, and a faint tract of light trembled across the distant waters; along which she seemed to be pursuing her way into an arch of silver radiance, the gate to some other world. Next time, the round disk was just clearing the horizon, and appeared about to lift the ship with it, as on a shield, into the upper air. Then at last, the moon ascended the sky; and like one too late, the ship was holding on alone to the darkened verge: while upon the green wave-tops near us there gradually fell a broken lustre, and hour after hour the Maria pursued her westward course, followed by the glance of that large, full, glorious planet, such as she is never seen in the cold northern climes.

THIEF-MAKING AND THIEF-TAKING.

THE frequent publication of prison reports and criminal statistics of late years, has led many persons to imagine that crime is greatly on the increase. But the number of misdemeanours and offences now every day recorded by the public press, is to be attributed rather to more efficient police arrangements, than to any deterioration of private or public morals. A glance at the history of crime in London will serve as an instructive illustration of this fact. During the past, and even in the present century, the bringing of criminals to justice was a trade in which any one might engage; and petty crimes were regarded as unprofitable stock—not worth the trouble of trial and conviction, and as necessary evils in a crowded community. Offences against the person were then much more frequent than in the present day, and acts of violence were often committed with impunity. It was unsafe to travel the roads in the vicinity of the metropolis after nightfall; even in the most crowded thoroughfares, persons were knocked down and robbed. According to Mr Colquhoun, a magistrate who published a work on the Metropolitan Police in 1797, there were at that time 115,000 persons 'who were supposed to support themselves in and near the metropolis by pursuits either criminal, illegal, or immoral.' The chief causes by which the ranks of this army of depredators were recruited he considered to consist in the large number (3000) of houses for the reception of stolen property, and of low taverns. The latter, he says, were the rendezvous of thieves: in the tap-rooms, men, women, and children might be seen crowded together; while the landlords, in too many instances, were either the leaders, or in the pay of gangs of thieves. The value of the property annually plundered he estimates at £2,100,000; adding, that no improvement could be expected, as the 'watchmen and patrols were comparatively of little use, from their age, infirmity, inattention, or corrupt practices.' By the authority of various acts of parliament then in force, the reward for the conviction of an offender was then fixed at £40; the consequence was, that those who made a trade of catching thieves took no pains to capture a criminal while he

was graduating through the minor degrees of crime, and brought him to trial only when he had committed an offence which, in their phraseology, 'made him worth £40.' Mr Colquhoun gives a tabular statement of 1088 individuals brought before the London magistrates in one year, comprising eight sessions, 1790-91. 'The melancholy catalogue,' he tells us, 'does not contain an account of above one-tenth part of the offences which are actually committed!' Out of the 1088 offenders, 711 were discharged as not worth the risk and trouble of prosecution. To this statement we may append the returns for 1841: in that year, with a population double that of the former period, the number of convictions was 2625.

But if we go back to the commencement of the century—the era of Jonathan Wild and his confederates—we find a still worse state of things. Human life then seemed to possess but little value in the estimation of the dispensers of the law, or of those who lived in defiance of the law. Wild, as is well known, traded in blood, and sold his victims to the gallows with a ferocious effrontery that finds no parallel in modern times. Perjury was resorted to on all occasions, either to save a friend, or ruin an enemy, as circumstances required; and there is too much reason to believe that those in authority winked at the audacious evasion of justice. The execution of the notorious thief-taker in 1725 had the effect, for a short time, of putting an end to the nefarious system which he had so long successfully practised. During his trial, Sir William Thompson, the recorder, told him that when the act was framed under which he was indicted, he had him (Wild) in mind, and knew he would one day be caught by it: a remark which savours strongly of the coarse feeling of the times.

The numerous rewards, however, for the apprehension of offenders, sanctioned by the legislature as the best means of protecting person and property, were too strong a temptation to be resisted by the vicious and evil-disposed. Before ten years were over, a gang of heartless wretches were again swearing away men's lives, sharing the rewards as prize-money amongst themselves, and every time they received a payment, holding what they called a *blood feast*. It is difficult to believe in the reality of such atrocities; but the murders committed by Burke and Hare within the past twenty years, and the recent instances of parents poisoning their own children at Stockport, to obtain the burial-fees, prove how much the natural feelings may become perverted when deprived of efficient moral control. At the period in question—about the middle of the last century—the scheme was so artfully contrived, as for a long time to defy detection. Evidence of the kind to secure conviction was never lacking. Beaumont and Fletcher seem to have been acquainted with similar miscreants and their proceedings, for they make one of their characters, Bartolus, describe—

'Substantial, fearless souls, that will swear suddenly,
That will swear anything.
* * * * * Be sure of witnesses;
Though they cost money, want no store of witnesses;
I have seen a handsome cause so foully lost, sir,
So beastly cast away for want of witnesses.'

At length, in 1755, the villanous transactions of the gang were brought to a close by the persevering exertions of Mr Joseph Cox, constable of Blackheath hundred, who the following year published a narrative of the proceedings, in which he says:—'The wicked and diabolical practice of thief-making and thief-taking, and of convicting poor friendless lads who never were thieves at all,' was introduced about twenty years before, and had increased in consequence of the rewards for the suppression of robberies.

The confederates in this case consisted of five or six men and one woman, under a leader named Macdaniel. At first their practice was to swear a robbery against any individuals with whose names they chanced to be acquainted, and press for a conviction, in spite of the

accused party's asseverations that he had never been near the spot. This villany, however, having been detected in one or two instances, they adopted means afterwards to entice their victims to the scene of the pretended robbery. Sometimes they attended the Old Bailey sessions, and 'marked' such prisoners as they thought likely to suit their purpose, observing that 'they would be sure of him again in a sessions or two.' At other times, one of the party would accost three or four lads whose habits and character were such as to give colour to the charge, and after treating them to drink, invite them to take a walk, which he always contrived should be towards the locality already fixed on for a robbery. In the course of the day or evening, the lads were taken to a notorious tavern in Black Boy Alley, or to some lodging-house known to be frequented by thieves, where, at a preconcerted hour, the thief-takers came and apprehended the whole party. When before the magistrate, the confederates contrived to have their man admitted evidence, and scarcely ever failed of obtaining a conviction at the next sessions, with the reward of L.30 or L.40 for each conviction.

Another plan of which these villains availed themselves for carrying on their designs with greater impunity, was to hire a room, and after placing in it a few articles of furniture or merchandise, entrap some unsuspecting victim into the robbing of it. Or they advertised the stoppage of stolen goods, with full description, which left the advertiser free from suspicion. The latter scheme, however, was only put in practice a day or two before the assizes, that the friends of the accused might be prevented, by want of time, from exposing the treachery. But the chances of discovery were braved; the fellows never hesitated to swear anything to carry their point; the real residence of the 'decoy-duck' was scrupulously concealed; but if by any chance he was arrested, the prosecutor swore he was not the thief. 'As for what the poor creatures themselves said,' writes Mr Cox, 'it stood for nothing, although they loudly declared their innocence, and with their dying breath would acknowledge they ought to die for the sins of an ill-spent life, but protested their being innocent of the fact for which they suffered.'

The ranks of the thief-takers, it is said, were continually recruited from the criminals annually discharged from Newgate, where they had received an apt education. In most cases the magistrates refused to hear informations against them, and the attempt to press these informations was exceedingly dangerous. In one year, 1749, they divided the enormous sum of L.6300, which had been paid to them for convictions in the county of Middlesex. If the robbery were laid in an adjoining county, the reward was greater; and we read of eight convictions producing L.1120. It is not surprising that the villains were unwilling to abandon so profitable a trade, one to which they were encouraged by short-sighted legislation. In some instances, however, their prey escaped them. One of the gang meeting Lyon Alexander, inquired if he wished to earn a shilling; the youth assented, and on going to the house indicated for a bundle, was shown into a room, where half-a-dozen men began to maltreat him. They dragged him through the streets to Wapping, bruising his fingers with their sticks whenever he attempted to cling to the railings; and crossing the river to Greenwich, gave him in charge to the constable for highway robbery. The lad was committed to Maidstone jail, where he found another youth accused by the same gang; and the assizes not coming on for a week, they wrote to their friends, who fortunately were able to employ counsel, on which the prosecution was abandoned. On another occasion, two youths, one of them not more than thirteen, were saved by the exertions of the foreman of the jury. Although unable to secure their acquittal, he suspected the falsehood of the charge, and by an appeal to the proper authorities, obtained a pardon; and the confederates, who had cunning enough to deceive the

court, jury, and nearly all concerned, were disappointed of their booty.

The manner in which these villainies were at last effectually exposed is worthy of record. A robbery was planned to take place at New Cross, near Greenwich, so as to insure the increased reward on conviction beyond the limit of Middlesex. Salmon, one of the gang, after drinking with two young men of indifferent character, persuaded them to bear him company in his walk down the Old Kent Road. Towards midnight he loitered behind, when Blee and Gahagan, two others of the gang, came up and robbed him of two pairs of leathern breeches, which he carried under his arm, with a tobacco box, and some other trifling articles. The thieves went off immediately to the rendezvous, where they were soon after followed by Salmon and his two unsuspecting companions. After further drinking, part of the stolen property was secreted on the persons of these two, when Macdaniel appeared and arrested them on a charge of highway robbery preferred by Salmon. Mr Cox's suspicions were first excited on learning that Macdaniel was well acquainted with Blee, who, although included in the charge, was yet at liberty. He therefore, with most praiseworthy perseverance, made a point of arresting Blee, the decoy-duck, unknown to Macdaniel, the mock prosecutor. The decoy immediately made an open confession, on which warrants were issued for the arrest of the chief confederates, to be served as soon as they had given their evidence on the trial of the two men at Maidstone. The apprehension of Blee was kept a profound secret; and the shortness of the interval before the assizes proved fatal to the party, who, with their usual confidence, went down into Kent to attend the trial. On descending from the witness-box after giving evidence, each one was quietly secured and handcuffed, though not without risk, as Macdaniel always went armed. Salmon was immediately committed for contriving his own robbery; and the other three, in spite of the leader's subterfuges, as accessories and abettors. It was, however, found, that through some defect in the law, they could not be tried on the capital charge. The case was argued during several days before the twelve judges, which ended in an indictment for conspiracy, by order of the lords of the treasury. The four criminals were soon after brought to trial, and condemned to imprisonment in Newgate for seven years, and to be set twice in the pillory. On their first public appearance, they were with difficulty saved from the fury of the mob. Gahagan was struck dead by a missile hurled from the crowd; and had it not been for the sheriffs, not one would have escaped popular vengeance.

Eventually the woman, Mary Jones, came in for her share of the punishment. A poor wretch named Kidden had been tried and convicted on her accusation of robbing her on the highway between Tottenham and London. Notwithstanding the prisoner's protestations of innocence, and the appeals of his friends to the secretary of state, he was condemned to be hanged. Some passages in the letters he wrote, while waiting for execution, mark the harsh treatment of prisoners at that period. In one, he informs his sister that he has no fire; and though black and blue with lying on the floor, is to be double-ironed. In another, he thanks her for sixpence, which she sent him, 'for,' he adds, 'we have nothing allowed us but one penny loaf a-day.' Blee afterwards confessed that Kidden was entirely innocent, and Mary Jones was committed to Newgate for wilful murder; on which Mr Cox concludes, 'I could not entertain the thoughts of relinquishing the pursuit, till I found these monsters fixed in those dreadful apartments appointed for the reception of the delinquents in the shedding of blood—the destroyers of the repose and tranquillity of the human race.'

An attempt to revive the blood-money system appears to have been made about the year 1816; but its promoters—Vaughan, a police officer, with some others—were sentenced to five years' imprisonment in Newgate;

to what extent they had carried it was never known. Since that period, as far as we can learn, it has not re-appeared; and any efforts to put it in practice at the present time would certainly fail of success. We could wish, for the sake of humanity, that the annals of crime were not made blacker by such fearful records; and though such deeds may not be committed now, places still exist in London where individuals may be hired to perjure themselves—to swear to anything for a consideration. Such blots can only be removed from our social condition by a true education—which, while informing the mind, improves and regulates the moral feelings.

GUTTA PERCHA.

THERE are some substances in nature which appear expressly intended to fill a sphere of utility peculiar to themselves, and for which no substitutes, or virtually none, seem capable of being discovered. Caoutchouc was one of these, *gutta percha* is another. This substance is of recent introduction into England, having been first brought under the notice of the Society of Arts in the autumn of 1843. The history of its discovery is thus given by Dr Montgomerie:—“While at Singapore in 1842, I on one occasion observed, in the hands of a Malayan woodman, the handle of a *parang* made of a substance which appeared quite new to me. My curiosity was excited, and on inquiry, I found it was made of the gutta percha, and that it could be moulded into any form, by simply dipping it in boiling water until it became heated throughout, when it became plastic as clay, and when cold, regained, unchanged, its original hardness and rigidity. I immediately possessed myself of the article, and desired the man to fetch me as much more of it as he could get. On making some experiments with it, I at once discovered that, if procurable in large quantities, it would become extensively useful.” The discovery was communicated to the Medical Board of Calcutta, and subsequently to the Society of Arts in London, and the announcement met with immediate attention in both quarters. Orders for considerable quantities were transmitted, and the gutta percha trade, for such it has become, assumed a definite organisation.

The tree from which it is procured is stated by Sir W. J. Hooker to belong to the natural order *Sapotaceæ*. It is found in abundance in many places in the island of Singapore, and in some dense forests at the extremity of the Malayan peninsula. The discoverer having applied to the celebrated and enterprising Mr Brook, requesting him to make inquiries for the tree at Sarawak, and on the west coast of Borneo, received the following communication from that gentleman:—“The tree is called *Niato* by the Sarawak people, but they are not acquainted with the properties of the sap: it attains a considerable size, even as large as six feet diameter; is plentiful in Sarawak, and most probably all over the island of Borneo.” The tree is stated to be one of the largest in the forests in which it is found, frequently attaining to the diameter of three or four feet, and occasionally to that above-mentioned. The timber is valueless for building purposes, on account of the loose and open character of its tissue; but the tree bears a fruit which yields a concrete oil, used for food by the natives. *Gutta percha* is contained in the sap, and is thus procured:—A magnificent tree of fifty, or perhaps one hundred years’ growth, is felled; the bark is stripped off, and a milky juice, which exudes from the lacerated surfaces, is collected, and poured into a trough, formed by the hollow stem of the plantain leaf. On exposure to the air, the juice quickly coagulates. From twenty to thirty pounds is the average produce of one tree. This wasteful, sinful procedure, is adopted to a very large extent, as may be conceived from the amount of the gutta now imported reaching many hundreds of tons annually. The inevitable consequence of such an extravagant short-sightedness it is not difficult to predict; and we may confidently expect,

that if measures are not taken to remedy the evil, *gutta percha* will in time cease to form an article of commerce, and exist only as a rarity in the cabinets of the curious, or in the hands of the instrument-maker. There is every reason to believe, could this greedy spirit be restrained, that an abundant supply might be obtained by simply making incisions in the bark of the tree, as in the case of the caoutchouc trees, and thus a perennial supply would be insured.

Gutta percha comes to us in two forms: the one in which it is in thin films or scraps, something similar to clippings of white leather; the other is in rolls, which, on a cross section, show that they are formed by rolling the thin layers together in a soft state. When pure, the slaps are transparent, and somewhat elastic, varying in colour from a whitish-yellow to a pink. In the mass it is seldom free from some impurities—such as sawdust, pieces of leaves, &c.—which must be removed before it is applicable for some of the more delicate uses proposed for the substance. It is purified by a process called ‘devilling,’ or kneading, which is done in hot water: the water soon dissolves some of the foreign matters, and washes out others, until after a short time the *gutta percha* is left in a mass, ductile, soft, and plastic, of a whitish-gray colour. Or this is more simply effected by dividing the substance into fragments, and then submitting them to a slightly-prolonged boiling in water. From the docile nature of the material, neither of these processes is attended with the difficulties attaching to the manipulation requisite for caoutchouc. *Gutta percha* thus prepared for use possesses very curious properties. Below the temperature of 50 degrees, it is as hard as wood, but it will receive an indentation from the finger nail. It is excessively tough, and only flexible in the condition of thin slaps: in the mass, it has a good deal the appearance, and something of the feel, of horn; its texture is somewhat fibrous; and from the resistance it offers to anything rubbed across it, it appears that it was first used as a substitute for horn for the handles of knives and choppers. By an increase of heat, it becomes more flexible, until, at a temperature considerably below the boiling point of water, the once rigid, tough, and obdurate mass becomes like so much softened bees’-wax. It is now easily cut and divided in any manner by a knife, and may be moulded into all varieties of form with the greatest ease; or may be cut and united again so perfectly, as scarcely to exhibit even the appearance of a joint, and possessing all the strength of an undivided mass. From a number of very small fragments it is quite easy to form a coherent mass, as firm as if no division had taken place. Whatever be the shape into which the *gutta percha* is now formed, it will retain precisely the same form as it cools, hardening again to its previous state of rigidity. A ball one inch in diameter was completely softened by boiling for ten minutes, and regained its hardness entirely in half an hour. It is an important fact, that these processes may be alternated any number of times without injury to the material. It is in a great measure devoid of elasticity, offering a striking contrast to caoutchouc, but its tenacity is little less than wonderful: a thin slip, an eighth of an inch substance, sustained a weight of forty-two pounds, and only broke with the pressure of fifty-six pounds. It offers great resistance to an extending power; but when drawn out, it remains without contracting in the same position. When in its hard state, it is cut with incredible difficulty by the knife or saw. Like caoutchouc, it burns brightly when lighted, disengaging the peculiar odour accompanying the combustion of that substance; like it also, it is soluble with difficulty in ether and other caoutchouc solvents, but very readily in oil of turpentine.

We may now properly consider the applications of this substance. The solution appears to be as well adapted as that of India-rubber for the manufacture of waterproof cloth, and for the other purposes to which that liquid is now applied. In the solid state, it is in use among the Malays principally for the purpose of

fore mentioned; and they adopt it in preference to wood and horn, even where the latter is attainable. There are a number of cases also in which it appears likely to become an admirable substitute for leather, possessing, as it does, some properties in common with, and some vastly superior to, those of that material. Its value has been readily recognised by our inventors, no less than six patents being already in existence having reference to this material. In these it is proposed to apply gutta percha as an ingredient in mastics and cements; for the manufacture of a thread which is used to form piece goods, ribbons, paper, and other articles; as a substitute for caoutchouc in binding books; for waterproofing boots, shoes, and other articles of apparel; for the manufacture of flexible hose, tubes, bottles, &c. But the most comprehensive is the patent of Mr Hancock, who has instituted a series of curious experiments upon this remarkable substance. He unites the gutta percha with caoutchouc and another substance called *jintawan*, by which an elastic material results, which is impervious to, and insoluble in, water. The hardness or elasticity of the compound is easily determined by the alteration of the amount of gutta percha: the latter is added in larger quantity if firmness is requisite, and *vice versa* if flexibility and elasticity are necessary. From this mixture a very curious substance, light, porous, and spongy, is prepared, suitable for stuffing or forming the seats of chairs, cushions, mattresses, &c.; it also forms springs for clocks, clasps, belts, garters, and string. By an alteration of the process, much hardness is acquired, and moulds and balls of the material are capable of being turned in a lathe, and otherwise treated like ivory. In this state it offers itself for a thousand other offices: thus it may be formed into excellent picture-frames, incredibly tough walking-sticks, door-handles, chess-men, sword and knife handles, buttons, combs, and flutes. It has also been proposed as a material for forming the embossed alphabets and maps for the blind, on account of the clear sharp impression it is capable of receiving and retaining. It has been suggested that it would make a good, certainly a harmless, stopping for decayed teeth. It is also an excellent matrix for receiving the impression of medals and coins, and is valuable on account of its subsequent non-liability to break. By mixing a proper portion of sulphuric acid with it, or adding a portion of wax or tallow, it may be reduced to any degree of solubility, and furnishes a good varnish, quite impermeable to water. Mr Hancock proposes such a fluid as valuable for amalgamating with colours in printing: it appears probable that this will form an extensive application of the discovery, and that colours so printed will prove as lasting as the fabrics on which they are impressed. Time alone, however, can determine the extent to which gutta percha will be applied in the useful and ornamental arts. There appears no doubt that it will soon become an article of commerce as important as, if not more so than, caoutchouc itself; and we believe that its persevering discoverer will have on many occasions, and for many years, to rejoice over the benefits he has been the means of conferring upon the present age by its introduction.

OCCASIONAL NOTES.

MUSICAL COPYRIGHT.

GLORIOUS Robert Burns! When George Thomson wrote to him, asking new songs for the old tunes, and offering remuneration, he said—'You may think my songs either above or below price; for they shall absolutely be the one or the other. . . . To talk of money, wages, fee, hire, &c. would be downright prostitution of soul. A proof of each of the songs that I compose I shall receive as a favour.' When, ten months after, Thomson sent a gift of money, Burns replied—'I assure you, my dear sir, you truly hurt me with your pecuniary parcel. . . . As to any more traffic of that debtor and creditor kind, I swear, on the least motion of it, I will indignantly spurn the bypast transaction, and from that mo-

ment commence entire stranger to you.' He was then an exciseman at fifty pounds a-year. Afterwards, when he had seventy, Mr Perry of the 'Morning Chronicle' offered him fifty-two guineas per annum if he would furnish once a-week an article for the poetical department of the newspaper. 'This offer,' says Dr Currie, 'the pride of genius disdain to accept.'

Burns was doubtless unreasonable on this point. He might have accepted from both Thomson and Perry with perfect propriety. It shows, however, the nice delicacy of the man, that he refused to receive these titles of mint and cummin. It also shows the small progress which mercenary ideas had then made amongst the men who exercised their intellects for the gratification of the public.

Contrast with this an announcement of the newspapers of our day, that, by a decision in the Court of Queen's Bench, a song cannot be even sung in public without the permission of the composer, under a penalty of at least forty shillings for each offence, the proprietor of the place where the song is sung being liable to the same penalty! Money, money, money!—always money! For this, it now fully appears, the composer melts us with the tender strains of love, seeks to inspire us with a love of country, or strikes our souls with pity and terror by calling up the ideas proper to a battle or a shipwreck. He aims at softening and refining us by his elegant and delightful art; but a toll must be paid as we walk up to his temple, under a forty-shillings penalty. Imagine Tyrtæus composing capital war-songs to inspirit his countrymen against the Persians, and then, when the soldiers were all ready to go on to battle singing them, 'Oh no, my dear friends,' interposes the bard; 'as individuals, you are welcome to sing my songs as long as you please; but as you now propose to sing them *in public*, I must have a consideration.' Think of the Troubadours squabbling for 'considerations' every time they sung each other's romances in abbey refectory or baron's hall; Thorold defending his romance of *Rollo* from a piratical recitation by Wace, and Wace prosecuting Thorold on account of his *Brut d'Angleterre*. Verily the times are changed since then.

We submit that, while it is but right that a man should be remunerated for the productions of his intellect, the tradesman part of the business ought surely to be as much softened as possible. To tell a man that he may gather a petty impost, if he can, upon every collection of people to whom one of his productions is presented, is to degrade him. Surely, too, the public could not well pay for their gratification in a way more cumbersome or uneconomical.

PROTECTION AGAINST THE SUN IN HOUSES.

We are now at a period of the year when the great enemy of comfort is no longer cold, but heat, and when workmen more especially, plying their occupations in sheds, attics, or other apartments with roofs exposed to the sun, suffer severely. A cheap and simple expedient for diminishing the temperature of such places has been recommended by a correspondent; and it proceeds upon a principle so perfectly well known, that it is surprising this obvious application of it should now come before us with anything like the air of a discovery. The gentleman complains, however, that nearly a year ago he published a statement on the subject in a provincial journal, and that since then not a single attempt has been made to test his plan, even in the town where the paper is printed. The principle refers to the heat-conducting and radiating powers of coloured substances. A thatched roof, more especially when new and bright, however warm it may keep the house in winter, preserves it comparatively cool in summer; while tiles receive and retain heat in proportion to the depth of their colour; and slates are worst of all, becoming so hot when the sun shines, that it is painful to touch them with the hand. In like manner, the warmth of our clothing depends upon the same circumstances. In

winter, we very properly wear dark, and in summer light colours; and in most tropical countries the natives are clothed exclusively in white.

Our correspondent mentions a case in which a wood-turner was absolutely driven from his business by the heat for two or three hours in the day. His workshop had a slated roof slanting to the south; and there being a small steam-engine within the building, the heat from this source, added to the heat from the roof (for there was no ceiling or plaster inside), raised the thermometer to 104 degrees, when it was 80 degrees out of doors in the shade. The remedy recommended was simply to *white-wash the roof*; and this had the effect of equalising the temperature within and without. 'The slates,' he adds, 'which before were so hot on the under side that they burnt the hand, were scarcely warmed by the sun after the whitewashing.' The materials, we are told, will not cost sixpence for a roof sixteen feet square; and if well sized, even a fortnight's continued rain will have little effect. Such a surface, therefore, might be renewed once or twice in the heat of summer, at a very trifling expense; while, if greater permanence were desired, the same result would be obtained by means of two coats of white oil-paint. The published paper of our correspondent concludes thus:—'While writing on the subject of cooling upper rooms, allow me to suggest an additional means of cooling all rooms, upper or lower, by means of a hole made in the wall, as near the ceiling as possible, with a sliding wooden shutter working horizontally in a frame, which may be opened or closed at pleasure. An opening one foot square, with frame and shutter complete, may be made for eighteenpence.'

'As the above suggestions are not the offspring of theory or imagination, but the results of practical experiment, and as their immediate adoption would greatly increase the health and comfort of thousands of your readers, without putting them to any inconvenient expense, I have no doubt you will kindly give them insertion.'

GRANDMOTHER HOOK.

A FEW evenings ago, I was at one of those old-world houses in Edinburgh where a man may actually invite himself to tea, and, without being stared at as a curiosity, take his place in a circle round a round table, dominated by a steaming urn. I would describe this tea-drinking as a relic of the olden time; but just now I have something else to do. Suffice it, that besides myself, there were at table an old maid, a young maid, the father and mother of the latter, and a gentleman-like man somewhere on the wrong side of forty. This man was the lion of the party, and performed wonderfully well. He was not like the caged animal, strutting up and down to show his paces, and growling, grinning, or yawning at the spectators; but resembled rather the free denizen of the forest, leaping and romping by turns, dignified or playful as occasion called; now making the room ring with his voice, and now 'roaring you 'an 'twere any nightingale.' In short, I was prepared to like the man very much; and seeing likewise that he was unusually good-looking for a male animal, you may imagine that I was not a little startled to hear that he had very recently been made a Benedict, and, strange to say, with a lady recognised under the appellation of Grandmother Hook!

The company, however, made themselves very merry with the poor gentleman's calamity; and the old maid especially was never weary of asking questions, seeming to derive a certain savage comfort from the idea of a lady getting married in her very grandmotherhood. The gentleman was at first a little embarrassed; but his tormentors being his near relations, it was necessary to answer; and at length, making up his mind to what

could not be avoided, he pulled a desperately grave face, and began to tell them 'all about it.'

'You may wonder,' said he, 'that at my mature years I had fallen so completely into my uncle's power as to give him the almost absolute disposal of my hand; but such was the fact. I was brought up, you know, to the very worst thing under the sun—expectations; and, consequently, I was good for nothing else but to keep on expecting. I spent many years as a walking gentleman of society in London, and many more in wandering to and fro upon the continent; but at length, when actually within hail of forty, I found myself once more with my legs under the mahogany of the Athenæum, and with nothing to pay for the good things above it but what came out of the pockets of a tough, and somewhat prepotent old man.'

'He had never before insisted upon my marrying; but the reason was, that he had remained in constant expectation of the occurrence taking place through my own connivance. Indeed it had been his business for many years to interpose gently between me and the catastrophe; suggesting now that I did not know enough of the lady, and again that I knew too much; and so forth. The fact is, I had never been without expectations of that sort; always voluntarily abandoned, till my first crop of gray hairs appeared. After this, the difficulty was on the side of the lady; and I was at length so much disgusted by the unreasonableness of the sex, that I determined to live and die a bachelor. Just at this moment I received a letter from my uncle, which I can repeat from memory, as it was short, and to the purpose. "DEAR NEPHEW—I am glad to hear of what you call the vacancy in your heart, as you will thus have no difficulty in fulfilling my wishes, and obeying my solemn injunctions. You have promised several times to marry, and you *must* now do so. I never interfered with your choice, and you are not to interfere with mine. The widow and heiress of my old comrade Hook is in the market. Our estates run into each other in such a way, that you might comprise them both in the same ring fence. She is a healthy woman, and not too young; and the arrangement is, that you are to be married at the end of her year of mourning, if she can fancy you."

'If she could fancy me! The widow of old Hook! and a healthy woman indeed! That touch was horrible. I thought my uncle must have intended it to try the extent of my loyalty; and I do not know that I had ever a fit of more bitter reflection than while conjuring up the idea it conveyed.' Here the lion paused, and wiped his forehead. The old maid bridled and tossed her head, as much as to say that, in her opinion, the like of him was not so mighty a catch for ladies beyond their girlhood; while the young maid trusted, sympathisingly, that as aged men have sometimes youthful wives, the case might not have turned out so very dreadful after all.

'That,' said the gentleman, 'did not fail to occur to me, and it gave me considerable comfort; for owing, I suppose, to the idle life I had led, I had not yet got rid of the ideas of romance that are so unfit for mature years like mine. It was one thing to indulge my despair in old bachelorhood, and quite another to carry my broken heart into the domestic society of an old woman. I confess I did hope that Mrs Hook owed her good condition at least to some lingering remains of youth; but a second letter from my uncle, in reply to my remonstrances, dissipated at once the fond illusion, by informing me that the widow's family could be no

possible objection, her only daughter being well married!

'There was no help for it. It was necessary to turn my meditations from the lady to the estate; and if I thought of the ring at all, to fancy it within a ring fence. But the affair could not be slept over any longer; and I set out for my uncle's seat, having previously signified to him my full acquiescence in his plans. In due time I arrived at the little town of Enderley, distant only a few miles from my destination. And here—'

'Never mind the little town!' interrupted the old maid. 'Come to the seat at once, and let us hear about the introduction, and how the lady looked.'

'Healthy, I hope!' said the young maid with a sneer, fixing eyes of beautiful contempt upon the lion.

'Ladies,' said the gentleman in a tone of depression, 'it is natural that I should wish to linger for a moment at this crisis of my fate; and besides, it was at Enderley I heard—and with cruel suddenness—of a circumstance connected with my intended, which made me at first determine to rush back to London, and, if necessary, take to street-sweeping, authorship, or any other desperate resource, rather than marry that Mrs Hook. I was passing a half-open door in the hotel, when I heard a female voice addressing a child in the terms of wise endearment consecrated to the rising generation. "It shall go," said the voice, "and so it shall, to its own gran—granny—grannyma; to its own—own—own—grannyma: that it shall, so it shall—wont it, I wonder?—to its own—Grannyma Hook!" Only think, my dearest ladies, what my feelings must have been, on thus learning (and the fact was confirmed the next minute by the landlord, in reply to my hurried questions) that my intended, old, and healthy bride was an absolute grandmother—Grandmother Hook!

'I intended to have gone on at once to my uncle's place, but that was now impossible. My agitated mind demanded repose. A night's reflections were necessary to arm me with sufficient philosophy to meet the destroyer of my peace; and engaging a bed at the inn, I went out to walk in the neighbouring wood. The locality was not chosen without a motive; for I knew that from the summit of a low hill, at a mile's distance, I should obtain a view of Enderley Court; and I felt that if anything could reconcile me to the idea of the healthy old widow, it would be the spectacle of her castellated mansion, seated in a park, which is a very paradise of beauty.

'There is a strange sympathy,' continued the lion musingly, 'between the soul of man and the aspect of nature. It would seem as if the waving line of beauty, described by hill and valley, embraced in its folds, and endowed with its charms, the possessor of the enchanted spot; as if the melody of woods and waters mingled with the mortal voice that owned them; as if the peeps of sky caught through embowering trees flung an azure glory upon the eyes to which the timber belonged!'

'Beautiful! beautiful!' broke in the mother for the first time; 'and as true as it is beautiful! Jemima, my love, that is philosophy.' Jemima looked coldly and distrustfully at her parent, but remained silent; and the old maid, who was obviously interested in Mrs Hook, remarked in a tone of soliloquy, that she was sure we should find her turn out to be a respectable and interesting woman.

'That was just my idea,' remarked the worshipper of nature, when he had cooled down. 'Every step I advanced reconciled me more and more to the old lady; and when I saw the glancing of a trout stream through the trees, I thought even of a hook without disgust. But just at this moment a sound broke upon my senses which disturbed me with recent and disagreeable associations; it was the squeal of a young child, and whisked off my thoughts at once to a hale, hearty, long-living grandmotherhood. Visions of canes and snuff-boxes rose before my eyes, everlasting coughs rattled in my ear, and, worse than all, the glances of matrimonial love

from the eyes of a grandmother froze my blood. How different were the sights and sounds of reality as I turned the corner of a clump of trees! The infant I had heard was lying on its back on a grassy knoll, fighting up with its little clenched fists, and crowing, as the nursemaids call it, with all its might; while bending over it, with eyes brimful of love and laughter, poking its tiny ribs with her fingers, snatching wild kisses from its brow, and seizing its neck with her lips as if she would throttle it, there knelt a young woman; and such a young woman! I did not think she could have been quite thirty.'

'Thirty! the old creature!' exclaimed Miss Jemima.

'The girl was probably a nursemaid?' remarked the old maid.

'She was neither an old creature nor a girl,' said the lion in a king-of-the-forest tone, 'but a woman in the very prime and glory of her years. Her bonnet was lying on the grass, and her dishevelled hair floating in dark masses over her shoulders; but a visible diadem sat on her queenly brow, just as a voice of peremptory command was felt in her light, joyous, leaping laugh. There was a fearless self-possessed grace in her manner, such as years superadd to the feminine softness of youth; and her features, originally moulded in wax, were now as firm, yet as exquisitely fine, as if they had been cut in the semi-transparent marble of Paros. While feasting on the beautiful picture formed by the mother and her child—surely that must have been the relationship?—a little incident occurred to disturb its grouping. The infant, with a shriller squeal of delight, and a more vigorous spasm of its limbs, suddenly rolled down the knoll, crowing as it went; and the lady, with a playful yet nervous cry of surprise, stretched after it in vain as she knelt, till she measured her whole length upon the sod. Before she could get up, I had sprung from my ambush, caught up the truant as it lay half-smothered in daisies and buttercups, and presented the prize to the flushed and startled mother. Such was my introduction to—to—'

'Not to Mrs Hook!' said the old maid with severity. 'You forget that you are now a married man!'

Miss Jemima was tearing absently the petals of a narcissus, and looking up with a forgiving sigh into the face of the narrator, said softly, 'But you were not married then!'

'To describe the conversation of this fascinating woman,' continued the gentleman, 'is impossible. She was not a woman of society, yet perfectly well-bred. She had spent the greater part of her life in the country, inhaling health of mind as well as body from the pure air of heaven, yet with occasional visits to, and occasional visitors from, the great cities, which enabled her, with the assistance not only of books, in the good old-fashioned sense of the term, but of the ephemeral literature of the day, to keep pace with the progress of the world.

'I do not know how it was, but our acquaintanceship seemed to be ready-made; and when at last I mentioned my uncle's name, she had no difficulty in recollecting that respectable friend of Mrs Hook. At the word I started as violently as if she had thrown the old lady's grandchild at my head; and the beautiful stranger looked at me with surprise and curiosity.

"You know Mrs Hook?" said I.

"Yes."

"What—old Mrs Hook?"

"Yes."

"Grandmother Hook?"

"Yes."

"How do you like the individual?"

"I sympathise with her; for I too—" And breaking off with a sigh, she held up the fairest hand in the world, so as to show a widow's ring. I had not observed the peculiarity in her slight mourning, but now saw that she, too, was a widow—a young and charming widow!—and that the infant (which was now alternately in her arms and mine) was the pledge of a love extinguished

in the grave! She was free—this lovely young woman; and I was about to be chained for life to Grandmother Hook! She saw my agitation, but of course could not comprehend its cause.

"Come," said she with an angelic smile, "I see you do not like my venerable friend; but I am determined to reconcile you to her. She is a grandmother, it is true, and therefore not so young as she has been; but she wears well—she is indeed particularly healthy; and thus, if you form a friendship for her, it is likely to last for many years."

"That is the misery," said I—"that is the misery! If she were but like other old women—if she were but liable to the common diseases of grandmothers, my fate might be endurable!"

"Your fate? What has your fate to do with the longevity of Mrs Hook?"

"I am only going to be married to her—that's all;" and the absurd announcement was no sooner out of my lips, than the fair stranger broke into peals of laughter, that to my ears, at the inauspicious moment, sounded like the screams of an evil spirit.

"Pardon me," said she, endeavouring to compose herself; "I am far too giddy for a—" And the widow kissed her orphan child. "But the idea of a marriage between you and Mrs Hook is really too ridiculous. You appear to be compelled to the sacrifice by circumstances; but has the old lady given her consent?"

"Her consent! oh, let her alone for that: it is not so often that a fellow like me comes in the way of a grandmother. There is no hope of her refusing me; and if I refuse her, I may as well hang myself up on one of those trees."

"Why adopt such an alternative? Although probably dependent on fortune, you are not too old to work and to struggle. If you will not allow poor aged Mrs Hook to enrich you, there are fortunes in the world still to be made by the adventurous and the industrious."

"Give me a motive," cried I suddenly, "and I will both dare and suffer! I cannot toll for so poor a meed as fortune; but place in the distance something worthy of my efforts, something rich enough to reward them, something—"

"What?" said she innocently.

"Love!" cried I in desperation; and before she could prevent me, I had caught hold of her hand, and smothered it with kisses.

"Upon my word!" interrupted the old maid. "This from a married man—from the husband of Mrs Hook!"

"But he was not married then!" whispered *Jemima* softly.

"Since you are displeased with such details," pursued the gentleman, "I shall pass them over. Let it suffice that I spent several hours with the lovely widow; that I saw—clearly saw—that only a little time was wanting to enable me to gain her affections; and that I at last bade her adieu, extorting a promise that she would not communicate my arrival to Mrs Hook; and that, when I called at the Court, she would see me alone, that I might have an opportunity of telling her what had passed between my uncle and me."

"Pray, what was the lady's name?" said Miss *Jemima*, as the lion paused.

"I never thought of asking."

"How could you tell that she lived at the Court?"

"I don't know: I took it into my head; and it happened that I was right."

"Under all circumstances, you seem to have made wonderful progress in so short a time!"

"Time is merely a relative word. An hour is occasionally as long as a day or a month; and a month, in other circumstances, passes as quickly as a day or an hour. The widow and I became better acquainted during the single interview I have described, than we should have done in the course of a hundred meetings in ordinary society. But to proceed. I found my re-

me the day before; and matters were not mended when I mentioned frankly some misgivings I had on the score of domestic happiness.

"Domestic fiddlestick!" cried he. "What more would you have than a good estate and a good wife—and a healthy woman to boot, come of a long-winded race, and as likely as not to lay you beside my old friend Hook? She is a grandmother already: does not that look well?" I laughed nervously.

"You do not think her too young?" and the old gentleman grinned. Another spasmodic cachinnation.

"Then what ails you at her—more especially since you tell me that there is 'a vacancy in your heart?' But here comes a letter from the Court." And tearing open a large old-fashioned-looking missive, presented to him by a servant, he read as follows:—

"MY DEAR SIR—I am told that your nephew has arrived; and as he has been reported upon favourably by one who saw him yesterday, and on whose taste and judgment I can rely, I am tempted to say, with the frankness of my character, that I shall be happy to make his acquaintance. I am truly grateful for the many obliging things I am told he said of me; and I hope one day or other he will find them all realised. My dearest grandchild sends a pretty little kiss to you both; and, with best regards, I remain as usual,

GRANDMOTHER HOOK."

"There!" cried the old gentleman with odious triumph—"there is a spirit for you! Why, you dog, you will be as happy as the day is long!"

"I scarcely heard him, for my thoughts were brooding bitterly over the treachery of the beautiful widow. She had broken her promise, and she had rendered my position a thousand times more embarrassing, by persuading the wretched grandmother that I had been such an ass as to say complimentary things about her age, ugliness, and infirmities! It was clear that she was a jilt; that she had only been laughing at my admiration; and that she was now determined to extract further amusement from my calamities. I resolved, however, to die game; and telling my uncle that, although well acquainted with Mrs Hook from report, I desired to see her personally before coming to a final decision, I threw myself on horseback, and galloped straightway to the Court."

"It was my intention to have asked for Mrs Hook; but the wily widow was on her guard, for as the door opened, I heard her call to the servant, in her silveriest tones, 'Show the gentleman here;' and in another minute I stood once more in the presence of the unknown of the forest. I found her more beautiful—better dressed—younger than the day before; and as I saw, with keener appreciation, the treasure I was about to lose for ever, my resentment died away, and deep choking grief took its place."

"You forgot your promise," said I: "you make a sport of my misery!"

"What could I say when questioned?" replied she sweetly. "But what misery do you allude to?—the misery of marrying a grandmother?"

"When my heart is devoted to another. But it is needless to talk to you, for you are as incapable of passion as a statue. You could never have loved even your husband."

"You are in some degree wrong; yet I was so young when I was married—only sixteen—that I looked upon my husband more as a guardian than as a lover. I was not quite seventeen when I became a mother."

"Is it possible? That is not a great while ago."

"Greater than you perhaps suppose; for a sound constitution and salubrious air are very deceitful. Would you take me to be well on to thirty-five?"

"What became of your child?" cried I suddenly.

"We all marry young in our family," replied the widow, hanging her head. "It was my daughter's infant," she continued, looking up at me with the most beautiful blush that ever lit the cheek of a girl, "which you gathered yesterday from among the daisies and

'Well, I declare,' said Miss Jemima, as the lion finished, 'that is as like a romance as any real story I ever heard! Only an author would never make his heroine a horrid old thing of thirty-five.'

'I am glad, for the sake of morality,' remarked the old maid, 'that she turned out to be Mrs Hook after all: only I cannot help thinking it a shocking example for girls to be grandmothers.'

THE WORKING-MAN IN AUSTRALIA.

A YOUNG man, who had just finished his apprenticeship in London, and who possessed a fair knowledge of housecarpentering, having been informed that higher wages were to be obtained in Australia, set sail for the antipodes, and in due time reached the town of Sydney. Here he learned, on landing, that a letter of credit in which he had invested his all—some fifty or sixty pounds—was worth little or nothing, the person on whom it was drawn having failed; and he thus found himself loose upon the world, with a tolerably good outfit for one in his station, but a very scanty supply of cash in his pocket.

After anxiously seeking employment, and in vain, for about three weeks, he fell in accidentally with a cedar-cutter from the Five Islands, who had been living there with his family under a few sheets of bark, but who now wanted a snug little hut run up; and with him the emigrant contracted for the job, on consideration of receiving £75 in money, with rations during the time, and the assistance of a convict servant in cutting the timber and other work. All being arranged, he set out early one morning on foot, with his convict-mate, for their destination; and in the evening their fatiguing march was enlivened by an Australian conflagration. 'Above us,' to use his own words, 'the sky was gloomy and still; all round us the far-stretching forests exposed a strange and varied pageant of darkness and fire, accompanied by the crackling of flames and the crash of falling trees. Here was a bridge over a deep creek, now empty with summer drought, with all its huge sleepers glowing in red charcoal, and tumbling together into heaps in the channel, and carrying down with them the top layer of slabs that, covered with earth, had been the roadway; over these we had to leap and clamber as we could, unless there was some track down across the creek-bed, by the side of the bridge. Here, again, some huge old tree came thundering down right across the road, and its boughs, kindling from the opposite side, were in full roaring blaze, lighting up everything nigh with ruddy brilliance, and throwing into the dense volume of smoke above a red semi-transparency. Farther on again, where the bush was thinner, and the materials for ravage more scanty, the fire had nearly subsided: all was obscure and silent, except some single trunk, off in the bush, hollow, and old, and headless, through whose chimney-like barrel went upwards, with fierce steady roar, a volume of flame, and crowds of sparks, into the blackness of night; and then, all on a sudden, the fire would reach a cluster of tree-heads, as yet untouched, and go blazing, and crackling, and leaping through them, until nothing was left for it to devour. The heat was in many places intense, and the smoke in others suffocating; whilst snakes, guanas, bandicoots, opossums, &c. were crossing the road in every direction, each in its natural dumbness, or with its wild wailing cry of fear.'

The next two nights they passed in huts, where they were received with much hospitality. One consisted of a single apartment formed of bark; while the other was a more aristocratic habitation, built of slabs of wood; but in both the fare was good and substantial. The next day they arrived at a creek, where the only means of crossing was a slender cabbage-tree flung from bank to bank (the rustic bridge of Australia), which the emigrant found somewhat formidable, till the idea occurred to him of *fencing* himself 'walking along the joist of an unboarded house.' This exercise of the imagination was successful, although there must have

been some little discrepancy between the two bridges; the cabbage-tree swinging over the abyss as the passenger stepped, till in the middle it plashed upon the water.

Having at length reached their destination, they set to work to fell trees for the future hut, living themselves, in the meantime, in a tent composed of a few sheets of bark, 'leaned together, top to top, tent-like, with one end stopped by another sheet, and the fire a few feet in front on the ground at the other.' This was very well in fine weather; but by and by it came on to rain—with a will. The rain penetrated the roof, and ran through the bottom of the hut like a mill-stream, till their beds got thoroughly soaked. Dick, however, got a flint and steel; and when they had relighted the fire, baled out the water, and soled themselves with plenty of tobacco and tea; they made their beds (luxuriously turning the dry side uppermost), and went to sleep.

The next adventure was with bushrangers, two of whom called at the hut one night, and after a very moral, not to say philosophical conversation—in which the emigrant was told that 'if he acted as a man, whether he were free or bond, he would be respected by every man that knew himself'—compelled the mate to pilot them to the employer's farm. Soon after, they returned with a load of rum, tea, sugar, and tobacco; and after eating a hearty supper, set off into the bush with their booty.

This job being completed, and the balance of money paid, it was necessary to look out for farther employment; and the adventurer, shouldering his tools and other baggage, set forth to walk through the cedar forest. He at length reached a hut, the master of which wanted a mate in sawing, and here he remained till his employer's task was finished. 'We used to get up,' says he, 'in the winter, and have our breakfast before going to work, on account of the day being so short in the cedar-brush. The lifts in a cedar-brush are very heavy. I have often worked for half a-day together with a lever that I could barely lift into its place. Besides this, the only intermission through the day is one hour at noon for dinner, and perhaps twenty minutes towards the latter part of the afternoon, fifteen of which the topman employs in brightening up his saw, and the pitman in boiling a couple of pots of tea, and throwing the dust out of his pit; the other five are occupied in a very active lunch. Both men, if they are smokers, just light their short pipes, and turn to with them in their mouths. If any man can, without exaggeration, at night say he is as tired as a dog after a hard day's run, it is the cedar-sawyer. A striking peculiarity of the class is their colour, or rather deficiency of all colour. A few months' residence and hard work in the brush leaves most men as pallid as corpses. Probably this is chiefly the effect of shade, but promoted further by excessive perspiration; for it is not necessarily attended by any sensation of illness.'

When this job was completed, his capital amounted to about £80, a portion of which he invested in cattle, putting them out to pasture to the number of thirty-three, 'on the thirds'; that is to say, giving up a third of the increase for their keep. His next job was on the banks of the Hawkesbury. Here he found, in passing along, the maize or wheat cake, the joint of pork or beef, and the fragrant pot of tea, always ready for his refreshment, with abundance of pumpkins, preferable, he says, to any vegetable used in England, and water-melons too delicious to be described 'in mere words.' The native white girls, by a natural association of ideas, come into the next sentence; and he describes them as being very generally pretty. 'I do not know how to account for it, but there is common to them, in all points, a singularly marked feminine character—a gentle, simple *womanliness*, that is peculiarly agreeable.' After finishing his employment on the Hawkesbury, he was cheated of £20 in the settlement, being compelled to take a portion of the amount due to him in cattle,

charged at double the proper price. This is described as a tyranny, for which the working emigrant has practically no redress.

But a worse tyranny followed. On his way back to Sydney, he was arrested on the road, on pretence that his 'pass' was forged, and confined all night with every circumstance of hardship and indignity. This, it seems, was a common casualty among the working emigrants; as likewise the ceaseless and savage floggings to which the convicts were subjected.

One evening at Sydney, when loitering at the edge of the market wharf—for after his late laborious employments, he could not all at once prevail upon himself to undertake a new engagement—a lad in a boat asked him if he was going up the river. 'The thought directly struck me that I would do so; and the whole course of my future life was, I may say, immediately marked out by a single step. This little event was the first of the particular train of circumstances which has constituted my whole subsequent adventures and settled my character. It led, in the first place, to my becoming passionately fond of books; and, again, to my meeting with perhaps the only woman I should ever have fallen in with whose character could have permanently attached me. We pushed off from the wharf, and in five minutes were in the middle of the bay, and cracking along with a pretty fresh breeze under all the sail (and rather more) that the boat would carry.' For some time he could find no employment, although wood-sawing was abundant. He was civilly, nay hospitably treated, but still looked upon with suspicion—because he was not a convict like his neighbours. At length he fell in accidentally with a young Australian (of white parentage), with whom he was destined to work for a considerable time, and whose sister eventually became his wife. 'The reader will probably smile when my first remark about my new abode is, that I was no sooner in it, and seated, and had looked about me, than I felt I was at last at home. I have come fully to the conclusion, and especially do so the older I am, and the more I feel what mind is, that there are certain presentiments derived from reason, yet in themselves far above what we conceive of the nature and province of reason.' The next morning, after an hour's stroll, he returned into the hut to breakfast, and saw for the first time 'the very person he had always wanted—this was clear to him directly he saw her.'

In the meantime, however, it was necessary to work, and work he and his mate (the future brother-in-law) did with great energy, till in the middle of it they were floated off by a sudden rise of the river. 'The day had been sunny, and the night was temperate and still; there was, in short, no indication whatever where we were of falling weather. Some such, however, there must have been somewhere; for about an hour after midnight I was disturbed by R— shaking me, and felt on the instant of waking a most unforgettable sensation—I felt as if I were lying stretched on a cold dunghill.' It was somewhat worse; for they had little more than time to get upon a cedar plank, and save themselves, by catching hold of a tree. 'Where we were no dead timber of any size could be swept against us; but we could hear it striking together, and grinding and crashing in the river, a few yards off. The little light we had dazzled our eyes, so that the sky seemed a vast dark void. The rats swam boldly up, and got on the plank with us, and numbers of spiders and centipedes were crawling in all directions over both us and it. In this state we had to continue at least three good hours; then day began to dawn. We knew we were rising by getting more and more near the branches; but we had no notion how deep the water had become around us. As the deep obscurity of the brush began to be dissolved by the dawn, we could discern no vestige of our hut; and presently, when the light so far increased that we could see as far as the pit, we discovered that the water was up to the bottom of the log that was on, so that there was about six and a-half feet depth. Although

it was now light, we were nearly as bad off as ever. The sounds of such a deluge in the night, in the midst of the brush, are certainly cowering to the spirits; but one knows so well that the danger, except from actual drowning, is next to nothing, and there are such plentiful means for escaping by getting up the trees, that, after all, it makes no very serious impression. The loneliness and fear of starving were what most affected me: we could not tell but it might last for many days; and as long as it lasted, there seemed no hope of getting across the river. On this side we were so surrounded by brush, that any attempt to get our plank through to the high ground was out of the question; and it was much too deep to wade. The raw chilly air of the morning, and the water together, made me shiver until I was quite sick, and my mate was not much better. We both of us felt that to continue exposed thus, without food, would soon wear us out, so that we should not be able to make an effort to save ourselves by swimming the river. In this undecided and helpless state we passed the time until nearly noon, the water rising higher and higher.' They at length determined to drop down the river from tree to tree on their frail bark, and ascend in like manner a creek at some distance, leading up to a part of the country that was not inundated; and this they accomplished; 'but so tired of the uneasy saddle on which we had now been for many hours, and our legs so benumbed, that we actually could not stand on them, but crawled up the range to the high road on our knees. I was not well for years afterwards; indeed I attribute to the wet and cold of this night an illness I had long subsequently. If I were to say I have never been entirely well since, I should not misstate the fact; and I know of no other cause which I could suppose to have brought about so suddenly this change for the worse in a constitution hitherto uninjured.'

Notwithstanding this accident, they continued working hard, sending or taking great quantities of timber to Sydney, and our intelligent mechanic's little capital increasing in proportion. He at length purchased a considerable addition to his stock of cattle; and his friend having likewise some property of the same kind, they set out to look for a 'run' for them, determining to employ a stockman of their own to look after them. In this journey they met with some of the miserable natives. 'Our night's quarters were rendered still more memorable and comfortable by the blacks having had a battle here that afternoon. Three dead bodies were lying on the flat, with the ghastly grin of those who have died the hater's death. Two of them had been killed by body wounds with jagged spears, that had torn their way out frightfully; the other's was a head-wound with a tomahawk. The weapon had gone right through his mat of woolly black hair into the brain: very little blood had flowed; but the "gins" (black women) told us he died almost instantly. As I came in from looking after my horse, I passed them as they lay cold and prone in the thin misty moonlight, each on the spot where he had fallen. The wife of one of them—a fine, but small Hercules-like figure—sat, or rather reclined, by him, sobbing as if her heart would break. Another was quite a lad; and the other an old gray-bearded man, who had been a great warrior in his day. Nobody was near either of them.'

In this journey, which occupied a month, he passed near a true wilderness. 'Never-ending forest, with here and there a little meadow-like spot, covered with the coarse grass called "blade of grass;" a geographical surface so varied, wild, and wonderful, that you seem to be in another land; great unfathomable gulfs of woody valley, irregular and bewildering ridges, a flock of kangaroo, or a scarcely less wild flock of bush-cattle galloping down upon you, at a charge pace, to within a few feet, and there standing, encircling and staring at you, and then, at the first motion of an arm or sound of a voice, wheeling and tossing their heads, and snorting and bursting away like a living hurricane through

the crashing bush: such was the scenery.' In such wilds it is common for unwary persons to lose themselves; and the desolate, treeless plains occasionally met with are nearly as dangerous in this respect, the wanderer getting speedily out of sight of any intelligible landmark.

Near the 'run' they at length pitched upon they found several other stock stations, where the people seemed to have very confused notions of the rights of property, clapping their own mark, without ceremony, upon any cattle found without one. 'But it is worth while to observe, that an individual placed in the midst of such a gang, and keeping himself free alike from meddling on the one part against them, and from participation on the other, is in one of the securest of positions; for, in consideration of his forbearance, they will generally do him any service in their power, heading homeward his stray beasts, giving tidings of any lost ones, and a hundred other little offices of like kind.' But the utility of the branding does not appear to be quite clear after all, since the animals themselves are not a consenting party, and in many cases treat the ceremony as a very idle affair. 'I have known beasts break three strong ropes one after the other, charge everybody out of the yard, and then go over a six-rail fence at a flying leap, and get away unconquered to their wilds again.' Such rebels of course choose their own pastures, frequently in the wild grassy gullies of the mountains, whither they are tracked by individuals technically called gully-rakers, a kind of freebooters, who mark the desert-born families of the fugitives, and carry them off.

Having marked their cattle, the next business was to construct a dairy for milking such as chose to submit to the operation; and this was done by digging a hollow in a hill, in order to avoid the excessive heats. They now sent butter to Sydney, and sat fairly down as farmers, giving up entirely the trade of wood-sawing.

Our author's advice to the settler, from personal experience, is this:—1. Let him, by way of an introduction, put his knapsack on his back, and penetrate on foot to the utmost limit of colonisation, to learn the science of living in the desert. 2. Let him then begin by feeling his way, laying out not more than a third of his capital at first, whatever it may be. For the rest he will receive high interest; and in the meantime his food and clothing will not cost him L.30 a-year. 3. Let him look to everything himself, and join personally in all the labour of the farm. 4. Let him treat his hands well, if not from feeling, from policy. To these general rules are added directions for the more immediate business of settling, for which we have no room.

With the exception of a wild adventure into which our ex-sawyer fell, through some informality in his purchase of the cattle, and some little fighting with the aborigines, there is nothing besides in the memoir of special interest to the reader; although we ought to mention one incident in compliment to the author himself—his marriage. The young couple now opened a general store, for the supply of the neighbouring stations; and although avoiding wine and spirit-dealing from conscientious motives, they contrived to make L.300 per annum by the business, although the original capital invested was not more than that sum. 'My wife was the almost sole manager of this portion of our affairs, from the beginning to the end, which was better than seven years. My occupation consisted in bringing the goods from Sydney, looking after our cattle, and getting in every year such a crop of one thing and another as quite covered our own consumption; wheat, maize, potatoes, and tobacco being the staple. My two sons, as they grew up, took kindly, as almost all the Australians do, to rural occupations. The eldest I left chiefly at the out-station, and the youngest was mostly with myself and his mother at the farm I first settled on. My own health at last took such a serious turn for the worse, that the doctor advised a return to my native clime. The hardships I had endured in the early part of my career in New South Wales, along with too great acti-

vity afterwards, were the only probable causes for it. I may say that, for years, I slept in wet bedding. The damp is so great in the perpetual shadow of the cedar-brush, that when, during a more than usually long stretch of wet weather, our blankets have become palpably wet, and we have attempted to dry them at the fire before going to bed, the steam would reek up from them as if from a boiling copper. Again, in the bustle of such an active life as mine, one has not time to be ill by instalments, and so I suppose the whole debt of this kind which nature claims of us has to be paid at once. The excitement of strong purpose probably keeps off the sense of exhaustion till this becomes downright illness, and will not be any longer neglected. Suffice it, that there appeared no alternative. When I first arrived in New South Wales, the perspiration used to flow profusely during the hot days; it now was substituted by a constant burning heat, without the slightest moisture; and at times by a sense, for hours, of icy coldness, while to the eye the whole atmosphere was, as it were, in a blaze, and the surface of the earth too hot for the feet to stand, for more than a few seconds, bare on the sand. It may be of advantage to some in the colony who have begun to experience similar symptoms, to learn that, though the voyage was trying, and the cold very painful in England when I first arrived, I am now obtaining the most sensible benefit, and consider myself in the direct road to completely renovated health.'

We have now run through this little narrative; which, the reader will perceive, contains matter that will amply repay his trouble in referring to the volumes themselves, entitled 'Settlers and Convicts, or Recollections of Sixteen Years' Labour in the Australian Backwoods'; published by Charles Cox, London.

CHARLES EDWARD AT PRESTONPANS.

BY D. M. MOIR (Δ).*

[Written after walking over the Field with Robert Chambers, on the Centenary of the Battle, 31st September 1845.]

GRIM and cloud-begirt the morning
Rose from out the German wave;
Blindly landward clouds of vapour
Through the woods of Seaton drove;
While, amid the dewy stubble,†
Eager for the approach of day,
Prone beneath their plaids and war-cloaks,
Side by side two armies lay.

Tolled forth 'six' the clock of Preston,
Woke from dawn to day the morn,
And the first red streaks of sunlight
Gilded Westfield's branching Thorn;‡
Then the billowy mists dispersing,
As the light breeze came and went,
Showed the Highland host in silence
Threading downwards from Tranent.

* [Reprinted, with the concurrence of the author, from the *Dumfriess Herald* (newspaper).]

† The army of Charles Edward moved from the west to the east side of Tranent, after it had become dark, on the evening preceding the battle, and bivouacked, stretching along the northern face of the slope, from the churchyard eastwards. The Prince himself lay in a bean-field, amid the cut bunches, which were still on the ground, near the farm-house of Green Wells.

‡ This venerable tree in part remains, but the main trunk was blown down in 1833, after having been very much injured by the quantity of fragments abstracted by visitors in the shape of relics. The field was visited by Sir Walter Scott in 1831; and a small drinking-cup, or *quatch*, constructed from a portion of the thorn, hooped with silver, and suitably inscribed, was prepared, to be presented to him on the occasion of a second promised visit, by Mr H. F. Cadell, of Cockenzie, at whose house he spent the afternoon. That opportunity, however, never took place, the symptoms of Sir Walter's last illness having shortly afterwards shown themselves; and the *quatch*, consequently, still remains in Mr Cadell's possession.

It was under this thorn, which stands as nearly as possible in the centre of the battle-field, that Colonel Gardiner received his death wound; and hence, to the eyes of many, the spot where the Christian soldier fell is, to use the words of Collins, covered by

—'a sweeter sod
Than Fancy's feet have ever trode.'

Shrilly blown, the Royal trumpet
Bade each corps its place assume;
Steeds were mounted, muskets shouldered,
Glittered flag, and nodded plume:
Rose the mists up like a curtain *
To the ceiling of the sky;
And the plain's wide diorama
Lay displayed before the eye.

Fast they closed, two hostile armies,
Hostile, yet of kindred blood,
Till the ranks of either's vanguard
Face to face opposing stood:
For a moment all was voiceless—
Every heart in prayer was hushed;
Then each clan struck up its pibroch,
And the mass to battle rushed!

Boom on boom the deep-mouthed cannon
Baked the ranks with crimson glare;
But the clansmen scruggled their bonnets †
O'er their brows with dogged air;
Clenched their teeth, unsheathed their broadswords,
Cast their cumbering plaids aside,
And, as hedge-like moved their columns, ‡
Danger scorned, and death defied.

Louder blared the Royal trumpet—
Hoarser rolled the kettle-drum,
As the carbined chargers, neighing,
Forward to the onset come:
Torrent-like, amid the tartans,
Splashed the horsemen's red array;
But stood firm that dingy phalanx,
Like the rock before the spray.

To that grim salute the rifles
With a running fire replied:
Oan it be, in spite of Gardiner,
That his troopers swerve aside?
Vainly, to impede their panio,
Wheeled his horse and waved his sword;
Vainly he appealed to duty,
Cheered them, checked them, and implored.

As the ocean swell, resistless,
Backward bears the yielding dike,
So the Gael bore down the Saxon,
Mingling bayonet, blade, and pike:
Resolutely Cope and Hawley
Propped the ranks that gave a-way;
While, though vainly, Home and Huntley
Battled to retrieve the day.

Horseless, with his knee on greensward,
As the life-blood from him poured,
' Rally, rally here!' cried Gardiner,
And aloft he waved his sword.
Round him fought a band devoted,
Till he sank upon the field:
Truer hero, Greek or Roman,
Ne'er was lifeless borne on shield!

Wo! for good and gallant Gardiner,
For the soldier and the saint;
Peace's lamb, and battle's lion,
Chivalry without a taint!
Asks the patriot for his tombstone? §
All unmarked his ashes lie;
But the soldier-friend of Doddridge |
Owms a name not soon to die!

* This scene has been touched with a pencil of light in Waverley, vol. II. chap. xviii. :—' At this moment the sun, which was now risen above the horizon, dispelled the mist. The vapours rose like a curtain, and showed the two armies in the act of closing.' &c.

† 'It was the emphatic custom of the Highlanders,' says Mr Chambers, 'before an onset to scrug their bonnets—that is, to pull their little blue caps down over their brows—so as to insure them against falling off in the ensuing mêlée.'—*History of Rebellion*, chap. xxiv.

‡ An eye-witness of the battle, in a communication inserted in the *Scots Magazine* of the day, describes their approach by this characteristic similitude.

§ Colonel Gardiner was buried, as were eight of his children, at the eastern gable of the old church of Tranent; but as that building was afterwards demolished for the erection of the present structure, the situation, I have understood, was built over. Before this was done, the tomb was opened, and the body showed itself in a very remarkable state of preservation; but on exposure to the air, the powdered queue, fastened by its black ribbon, dropping off, exposed the skull, with its fatal fracture—a sad proof of identity!

| The colonel, as is well known, found an able and affectionate biographer in his celebrated friend Dr Doddridge, who, in 1747, published his 'Remarkable Passages in the Life of Colonel James Gardiner'—a little work, which to this day continues to enjoy an uninterrupted popularity, and divides the winter evening hours by the rustic hearth with 'The Scots Worthies,' 'Thomson's Seasons,' and 'Burns.'

From that ill-starred field of slaughter
Fled the panic-struck in swarms;
Strewed were all the paths to Bankton,
And to Wallyford, with arms;
On to Dolphinston and Biralie,
Fingilton and Prestonpans,
Rushed the fugitives, fear-scattered,
And pursued the shouting clans.

Day of triumph for the Stuart!
Fifful burst of sunny light!
And, at Falkirk, yet another,
Ere set in Culloden's night:
Then with eagles on the corral,
Or with foxes under ground,
Hunted—homeless—and an hungered,*
Might thy rival, Guelph, be found.

Dismal, too, their after fortunes,
Who, in that mistaken cause,
By a zeal and faith unshaken,
Sought and won the world's applause:
Those laid life down on the scaffold—
These were scattered far and wide—
And, from foreign shores, in exile,
Looked to Scotland ere they died!

Looked to—yearned for—Scotland's mountains;
For the glen in purple glow;
For the castle on its islet,
Mirrored in the loch below;
For the shelling, wood-and-stream-girt,
Where Romance Youth's summer sped;
For the belfry by the gray kirk,
In whose shadow slept their dead.

Yet full long, from lips of fervour,
When the natal day came round,
Toasted was the name forbidden,
With a quenchless love profound;
And in bosom or in bonnet,
Still the emblem—Rose of White—†
Told the wearer, though he spake not,
Heart and soul a Jacobite!

Under Westfield's Thorn-tree standing,
Here Cockenzie—there Tranent—
On the fields we picture, map-like,
How the battle came and went:
Round are ranged the sheaves of harvest;
This is Preston; where are they
Who were victors, who were vanquished,
Just a hundred years this day?

In that question lies its answer:—
None who wished and watched the sun
On that morn of stormy warfare,
Now behold its beams—not one!
Year by year, Time's scythe hath thinned them,
Till have vanished quite, at length,
Even the scattered few surviving
Last, by reason of more strength.

Newer wars and woes have followed,
Other fields been fought and won;
Each fresh generation wrapt in
Aims and objects of its own:
And as, loitering, the wayfarer
Casts on Preston crofts his eye,
Deeply from the Past and Present
Reads his heart a homily!

HISTORY.

History is the resurrection of ages past; it gives us the scenes of human life, that, by their acting, we may learn to correct and improve. What can be more profitable to man, than, by an easy change and a delightful entertainment, to make himself wise by the imitation of heroic virtues, or by the evitacion of detected vices?—where the glorious actions of the worthiest traders on the world's stage shall become our guide and conduct, and the errors that the weak have fallen into shall be marked out to us as rocks that we ought to avoid. It is learning wisdom at the cost of others; and, what is rare, it makes a man the better for being pleased.—*Folkham*.

* The three great romantic episodes of modern warfare have always seemed to me—those of Charles Edward and his Highlanders in 1745; of Toussaint L'Ouverture and his Haytiens; and of Hofer and the Tyrolese in 1813. When we take into consideration the results flowing from the defeat of Culloden, and that the faith of a poor people was proof against the most tempting rewards, in a cause, moreover, where everything was to be lost, and nothing could be gained, the first of the three is certainly the most extraordinary.

† The white rose and the white cockade were the Stuart insignia; and, as such, respected and venerated by their partisans.

ANTS IN PERU.

Who can describe the countless myriads of ants which swarm through the forests? Every shrub is full of creeping life, and the decayed vegetation affords harbour for some peculiar kinds of these insects. The large, yellow *puca qici* is seen in multitudes in the open air, and it even penetrates into the dwellings. This insect does not bite, but its crawling creates great irritation to the skin. The small black *yana qici*, on the contrary, inflicts most painful punctures. A very mischievous species of stinging ant is the black *sunchiron*. This insect inflicts a puncture with a long sting, which he carries in the rear of his body. The wound is exceedingly painful, and is sometimes attended by dangerous consequences. My travelling companion, C. Klee, being stung by one of these ants, suffered such severe pain and fever, that he was for a short while delirious. A few nights afterwards, a similar attack was made on myself during sleep. It suddenly awoke me, and caused me to start up with a convulsive spring. I must confess that I never, in my whole life, experienced such severe pain as I did at that moment. A most remarkable phenomenon is exhibited by the swarms of the species called 'the great wandering ant.' They appear suddenly in trains of countless myriads, and proceed forward in a straight direction, without stopping. The small, the weak, and the neuters are placed in the centre, while the large and the strong flank the army, and look out for prey. These swarms, called by the natives *chacus*, sometimes enter a hut and clear it of all insects, amphibians, and other disagreeable guests. This work being accomplished, they again form themselves into a long train, and move onwards. The united force of these small creatures is vast, and there is no approach to the fabulous, when it is related that not only snakes, but also large mammalia, such as agoutis, armadillos, &c. on being surprised by them, are soon killed. On the light dry parts of the higher montañas we find the large conical dwellings of the *Termes* so firmly built, that they are impenetrable even to rifle-shot. They sometimes stand singly, sometimes together, in long lines. In form they strongly resemble the simple, conical *Puna hats*.—*Dr Von Tschudi*.

CLOTHING FOR THE YOUNG.

Are the little 'Highlanders' whom we meet during three out of the four quarters of the year under the guardianship of their nurserymaids, dawdling about the streets in our public walks or squares, properly protected from the cold? Are the fantastically-attired children whom we see 'taking an airing' in carriages in our parks, sufficiently and properly clad? If these questions can be truly answered in the affirmative, then, and then only, my remarks are needless. There can enter into the parent mind no more baneful idea than that of rendering children 'hardy' by exposing them unnecessarily to cold, and by clothing them inefficiently. I have known instances wherein parents, acting on this principle, have failed entirely in rearing their offspring. Does nature treat her progeny thus? Does she not, first of all, insure the birth of her young only at a kindly season, and then provide them with downy coverings, warm nests, and assiduous protectors? And we must imitate nature, if we would give to Britain a race capable and worthy of maintaining her independence and honour. The little denizens of a warm nursery must not be subjected, without a carefully-assorted covering, to the piercing and relentless east or north-east wind; they must not be permitted to imbibe the seeds of that dreadful scourge of this climate—consumption—in their walks for exercise and health; they must be tended, as the future lords of the earth, with jealous care and judicious zeal. *One-sixth of the deaths of young children, it must be remembered, result from cold.*—*Erasmus Wilson*.

CALIFORNIAN HOUSES.

Externally, the habitations have a cheerless aspect, in consequence of the paucity of windows, which are almost unobtainable luxuries. Glass is rendered ruinously dear by the exorbitant duties, while parchment, surely a better substitute than a cubic yard of adobe, is clearly inadmissible in California, on account of the trouble of its preparation; and, to increase the expense, carpenters are equally extravagant and saucy, charging three dollars for such a day's work as one is likely to get from fellows that will not labour more than three days in the week. After all, perhaps the Californians do not feel the privation of

light to be an evil. While it certainly makes the rooms cooler, it cannot, by any possibility, interfere with the occupations of those who do nothing; and even for the purposes of ventilation, windows are hardly needed, inasmuch as the bedding, the only thing that requires fresh air, is daily exposed to the sun and wind. Among the Californian housewives, the bed is quite a show, enjoying, as it does, the full benefit of contrast. While the other furniture consists of a deal-table and some badly-made chairs, with probably a Dutch clock and an old looking-glass, the bed ostentatiously challenges admiration, with its snowy sheets fringed with lace, its pile of soft pillows covered with the finest linen or the richest satin, and its well-arranged drapery of costly and tasteful curtains. Still, notwithstanding the washings and the airings, this bed is but a whitened sepulchre, concealing in the interior a pestilential wool-matress, the impregnable stronghold of millions of *las pulgas*.—*Sir George Simpson*.

PROPAGATION OF THOUGHT.

Who shall say at what point in the stream of time the personal character of any individual now on the earth shall cease to influence? A sentiment, a habit of feeling once communicated to another mind is gone; it is beyond recall; it bore the stamp of virtue; it is blessing man, and owned by Heaven: its character was evil; vain the remorse that would revoke it, vain the gnawing anxiety that would compute its mischief; its immediate, and to us visible, effect may soon be spent; its remote one, who shall calculate? The oak which waves in our forest to-day, owes its form, its species, and its tint to the acorn which dropped from its remote ancestor, under whose shade Druids worshipped. 'Human life extends beyond the threescore years and ten which bound its visible existence here.' The spirit is removed into another region, the body is crumbling into dust, the very name is forgotten upon earth; but living and working still is the influence generated by the moral features of him who has so long since passed away. The characters of the dead are wrought into those of the living; the generation below the sod formed that which now dwells and acts upon the earth, the existing generation is moulding that which succeed it, and distant posterity shall inherit the characteristics which we infuse into our children to-day.—*The Parent's High Commission*.

MORAL EFFECTS OF PESTILENCE.

All witnesses, and a knowledge of our common nature, tell us that the continual recurrence of these scenes of sickness and death, instead of softening the heart, usually hardens it. Read the accounts of all great plagues: the plague at Athens—the plague at Milan, as described either in the historians of the day and the biographers of Cardinal Borromeo, or in the more popular pages of the best Italian novel, the '*Promessi Sposi*'—read the account of the plague in London—and you will see that in all these cases the bulk of the people become more reckless and profligate than ever.—*Viscount Ebrington*.

SMALL LOAVES.

It is a sound dietetic observation, that bread, if wished to be as easily digested as possible, should be baked in small loaves. The principal reason for this is, that the products of fermentation, which are obstructive to digestion, escape more completely from a small loaf than from a large one. There is, moreover, less necessity for putting the bread into a very hot oven, or for keeping it in the oven so long a time as to deprive the outer part of its nutritive qualities. Bread baked in small loaves is sweeter to the taste than when baked in large loaves; and this is probably because it is more entirely freed from the products of fermentation.—*Robertson on Diet and Regimen*.

THE AFFECTIONS.

It appears unaccountable that our teachers generally have directed their instructions to the head, with very little attention to the heart. From Aristotle down to Locke, books without number have been composed for cultivating and improving the understanding; but few, in proportion, for cultivating and improving the affections.—*Lord Kames*.

PRICE 1½d.

THE PRINCE.

EXACTLY one hundred years ago, there arrived in the town of Rochelle in France a young man, apparently under twenty, of very elegant appearance, but simple and unpretending manners. He was attended, rather than accompanied, by an elderly gray-headed man, who seemed to be neither a domestic nor a parent, but who regarded him with all the respect of the one, and all the careful fondness of the other. The youth, indeed, appeared to require a certain watchful attendance, although surrounded, as one might have imagined, by some prestige which precluded familiarity; for, notwithstanding the cool quiet air supposed to distinguish the great, he was thoughtless and capricious in no ordinary degree, giving way habitually, and without the slightest consideration, to the whim of the moment. Both were plainly dressed. They neither courted nor shunned observation; and the only singularity which distinguished them from ordinary travellers, was their declining to take up their abode in the inn, even for the short period they intended to remain. They at once furnished an apartment for themselves at a private house, though by no means on an extravagant scale—the whole expense amounting only to L.20; and there they resided together, without making a single acquaintance, very rarely stirring abroad, and living chiefly on shell-fish, but more especially fresh-water crabs—a circumstance that excited some notice, from these delicacies being scarce and dear at Rochelle.

It appeared to be their business here to find a passage for the younger of the two to some foreign country; but in consequence of the hot war with England, vessels did not sail so frequently as usual, and they were for some time disappointed. At length an occasion offered. A small merchantman was about to sail for Martinique; and this appearing to be as good a theatre as any for the study of the world, it was determined that the youth should embrace the opportunity, and sail forth on his course of adventures. The moment of embarkation had nearly arrived, and he was in close conversation with his elderly companion, when the lady of the house inquired what he intended to do with his furniture?

'What do you say?' said the young man absently. 'Oh, the furniture! Keep it,' continued he, with a courteous smile, 'for a remembrance of me.' The lady looked at the other in surprise, but the transaction appeared to make no impression upon him of any kind; and when the interruption was over, he resumed the conversation without remark. This would not, perhaps, have appeared extraordinary in very wealthy people; but the fact was certain, that the youth's funds, on embarking for the West Indies, hardly amounted to more than the value he thus heedlessly gave away:

and the two strangers vanished from Rochelle, the one by sea, and the other by land, leaving behind them a grand enigma for the ingenuity of the townspeople.

The youth's reputation in all probability had got on board before him; although the elderly traveller, in recommending him to the captain, could not be prevailed upon to say more than that he was a person of distinction, whose friends would one day show their gratitude for any services that were rendered him. This, however, was sufficient to insure his being treated with respect; and indeed the dignified manner of the youthful voyager would have extorted respect of itself. In his person he was neither handsome nor tall; his features were common, though sufficiently agreeable; he was of the middle stature; and, in short, he had nothing whatever to distinguish him, but a certain air of high life, and a singularly white and delicate skin, as if he had never, since his birth, been permitted to be visited too roughly even by the winds of heaven.

An incident occurred during the voyage which warmed the respect of the crew into affection. On an alarm of the approach of English cruisers, almost all got into the shallop, to creep along the coast close inshore; and so suddenly was the step taken, that no provisions were thought of. The result was extreme hunger in the boat; which was generously relieved by their passenger, who bought a stock of refreshments from one of the native craft, and distributed them, share and share alike, to all on board. When they returned to the ship, the youth was seized with an illness; and it was remarked, with more of interest than displeasure, that a certain degree of haughtiness mingled with the courtesy with which he received the anxious attentions that were pressed upon him from all quarters. His situation required care and tenderness, but he seemed to shrink from familiarity; till at length the necessities of his condition led him to select, as his attendant, a young man only a few years older than himself. To this person, whose name was Rhodex, and who was of a respectable family and liberal education, he gradually became attached, and at length bestowed upon him even some portion of his confidence.

Rhodex reported that the stranger was the Count de Tarnaud, the son of a field-marshal; but this was by no means so lofty a dignity as to account for the respect of the confidant, which seemed to increase every day. In fact, the avowal of his rank only made the mystery more dense; till all speculations were at length ended for the time by the appearance of the port of Martinique, blocked up by English cruisers. Under these circumstances, as it was impossible to save ship or cargo, the vessel was abandoned, and all on board took to their boats, and landed on the island in safety, but in total destitution. The count bore his misfortune very coolly, perhaps merely regarding it as one of the adventures

he had come to seek; and, followed by Rhodex, went straight to the most respectable house he could find. Here he was received with much kindness by an officer called Duval Ferrol, whose attentions he accepted as a common matter of course; replying slightly and vaguely to his questions, and making himself as comfortable as possible. The host received but small enlightenment from Rhodex, who told all the little the reader already knows, but appeared either unable to proceed farther, or terrified to do so; and the real mystery thus came to be thickened with all kinds of conjectures and exaggerations, each more absurd than the last.

The commandant of the port at length thought it high time for him to enter upon the scene, and, by way of putting beyond all doubt the real rank of the stranger, offered him the use of his house and table. This the count accepted with much satisfaction; and, always accompanied by Rhodex, as a sort of gentleman attendant, or humble friend, removed at once to the residence of the commandant. It happened on the first day that, when all were sitting down to dinner, he found that he had forgotten his handkerchief, on which Rhodex immediately got up and brought it to him. This incident made the company stare at each other with unspeakable perplexity; for at the time of which we write, a white man waiting upon a white man, in the West Indies, was entirely unheard of. That Rhodex, who knew the customs of the place well, would submit to this dishonour in any ordinary case, was not to be supposed; and again the question recurred, who was this pretended count?

In the middle of dinner the commandant received a note from Duval Ferrol, the count's former host, containing these words: 'You wish for information relative to the French passenger who lodged with me some days: his signature will furnish more than I am able to give. I enclose you a letter I have just received from him.' The letter contained merely some common words of thanks, written in a schoolboy hand, and in a very bad style; but it was signed 'Est,' not Tarnaud. What could this mean? The commandant secretly despatched a friend to consult some persons better acquainted with the aristocracy than himself; and by the aid of an almanac, these gentlemen at length appeared to master the difficulty. The mysterious stranger could be no other than Hercules Renaud d'Est, hereditary Prince of Modena, and brother of the Duchess de Penthièvre!

Although this, for the present, was only a conjecture, it so happened that they had the means of verifying it; for there were two persons among them (one a brother-in-law of the commandant) who knew the prince by sight. In the evening, therefore—for they would not intrude earlier upon the dinner party—they all repaired to the commandant's house; and there his brother-in-law had no sooner cast his eyes upon the illustrious guest, than he pronounced him to be the duke. Even this, however, would not have been conclusive testimony, for the witness was reported to be so much averse to speaking truth, that he never did so, even when drunk; but he was supported by the other officer, and the affair was decided. By and by a flourish of bugles was heard without, and the brother-in-law and his friends, who had been pushing the decanters about the whole afternoon, while waiting till it should be time for the visit, drank, with loud cheers, to the health of Hercules Renaud d'Est, hereditary Prince of Modena. The stranger was confounded by this scene. He had probably signed 'Est' inadvertently, and the unexpected consequences filled him for a time with vexation and haughty displeasure.

The blockade of the English became in the meantime more and more strict, till it threatened at length to produce actual starvation. Supplies could be obtained only from Curaçoa and St Eustatia, and these, at the best, would have been scanty and expensive, even if they had not to pass through the hands of men who took the opportunity of preying upon the public misery. The chief of the monopolists was the governor of the Windward Islands himself, the Marquis de Caylus, who

resided at Martinique, and the derangement of whose private affairs had led to this contravention of his official duty. The discontent of the inhabitants became alarming; and as famine approached nearer and nearer, it assumed the aspect almost of insurrection. The presence of a reigning prince at this juncture was opportune; and the commandant, who hated the governor, intreated him to consecrate the cause of the people by becoming the head of the party. Our young paladin, we have seen, was humane, generous, thoughtless of consequences; and he was not long, therefore, of suffering himself to be prevailed upon to lend his countenance to the efforts of patriotism. He swore to put an end to the villany of the monopolists; and declared that, in the event of the English landing, he would himself lead on the inhabitants to repulse them. Such speeches had a great effect, for the name of prince is associated with ideas of loyalty; and the people of Martinique came to think it their duty to be loyal to the Duke of Modena, since that potentate happened, by whatever extraordinary chance it occurred, to find himself in the West Indies.

The Marquis de Caylus now began to feel somewhat uneasy at Fort St Pierre, and despatched an order to the commandant to send him his unruly guest. The commandant, however, suggested that he could by no means take such a liberty, since the individual in question was assuredly the hereditary Prince of Modena; and the marquis therefore addressed a letter to the Count de Tarnaud, inviting him to repair to his residence. 'To him,' replied his highness, 'I am Hercules Renaud d'Est, although the Count de Tarnaud to the rest of the world. If he desires to see me, let him repair to Fort Royal, which is half-way, and in four or five days I shall be there.' The officers who brought the missive reported the stranger's resemblance to the Duchess de Penthièvre, and the governor's doubts began to give way. He set out for Fort Royal as commanded; but his heart failed him, and he turned back. The prince, not finding him there, proceeded to Fort St Pierre, accompanied by a retinue of gentlemen, and was seen by the governor from his windows; upon which the latter, exclaiming that he was the very image of his mother and sister, left the place in a panic, and retired to Fort Royal.

The Rubicon was now passed. It would be affectation to repudiate longer a rank which had been assigned to him without any agency of his own, and the Prince of Modena assumed his ancestral state, and appointed his household. The Marquis d'Eraguy had the honour of being nominated his grand écuyer; Duval Ferrol, his first host on the island, became one of his gentlemen attendants; and the faithful Rhodex exulted in the office of page. He held a court, and gave formal audiences; and his levees were sedulously attended, not only by all who had complaints to make against the existing government, but by many of the officers of the administration, who conceived it politic to seek the protection of a hereditary prince. His palace was at first the convent of the Jesuits; but this excited so much the jealousy of the Dominicans, that after a time he removed to the establishment of the latter, where he was treated, if possible, with still more distinction. A table of thirty covers was laid for him and his guests every day. His dinner was a great spectacle, which passed on to the sound of trumpets; and as it was the custom to admit the people into the hall on the occasion, it became necessary to have the table defended by strong rails from the pressure of the crowd.

Under this régime, St Peter's presented the aspect of a vast theatre. Serious business was no more thought of; the wheels of government stood still; money once more came into active circulation; provisions, liberated from the chains of monopoly, arrived from all quarters; eating, drinking, and dancing were the order of the day; and, as if fortune had determined to signalise the reign, as it may be called, of the duke by her choicest triumphs, the news of the peace of Aix-la-Chapelle came

over the Atlantic to complete the general intoxication.

It may be supposed that the character of the royal adventurer was severely tested during a period of more brilliant fortune than he could have enjoyed on the ducal throne. We must remember, however, that he was a mere lad, exposed to temptation of every kind, and not condemn too severely the vagaries into which he was led by his wild and restless spirit. Accustomed to indulgence, as it appeared, from his cradle, he never knew what it was to repress a wish, or even feel a doubt; and he plunged madly into all the excesses of the time and place, and led the way in dissipation as zealously as he had offered to head the ranks of war. But the strange thing was, that even in his wildest moments he never forgot his rank. Neither the madness of wine, nor the witcheries of beauty, ever betrayed him into laying aside, for an instant, the dignity of the prince; and thus it was, that even the companions of his most unguarded hours continued to look upon him with a kind of awe.

The hospitality of the monks, it will be seen, was highly convenient for the wandering sovereign, who had landed in Martinique without a coin in his pocket; but soon he had abundance of money from a more legitimate source. It chanced that the Duke de Penthièvre possessed considerable property in the island; and his agent was of course not the last to present himself at the court of his constituent's brother-in-law. A gracious reception, and a half-hour's conversation in private, were sufficient to determine the honest man to do his duty to the family; and the Penthièvre funds were freely placed at the disposal of the young prince. This circumstance completely shut the mouths of the few malcontents who still affected to doubt his rank; for the agent was a prudent and cautious man, well acquainted with the affairs and connexions of the house, and would never have taken such a step except from absolute conviction. The malcontents, besides, could not fail to see that the money was not intrusted to unworthy hands. An impostor would either have squandered the treasure in mad extravagance, or have hoarded it against the time when he might think it necessary to decamp; but the Duke of Modena was neither careful of money nor profuse, spending just what was proper and liberal in his station, but nothing more. The doubters could not have been strengthened in their unbelief even by the consideration that on so remote a stage it was possible for an impostor to strut his little hour undiscovered, for he was always most anxious to meet everybody who came from Europe; and independently of the two gentlemen who had already recognised his person, a third, more recently arrived, recollected having seen him the year before at Venice. And the occasion was somewhat remarkable; for his highness, in a frolic, had broken in a shop glass articles to the amount of L.1500, which he afterwards paid for. Was it wonderful that so wild a youth had taken the fancy to come to Martinique?

Wildnesses of this kind, however, were now over, for he was here in the school of the world. His European education had only been begun, though begun on a princely scale. He possessed a smattering of half-a-dozen different sciences; he spoke, though indifferently, several languages besides his own, and understood a very little Latin. His drawing was better than his writing; he was a capital horseman; and, more than all, notwithstanding his flightiness, he had a great fund of natural good sense and precision of thought. If to this we add the most absolute self-possession, and a serene tranquillity of manner which nothing could disturb, it will be felt that, both in his merits and defects, Hercules Renaud d'Est was every inch a prince.

The prince wrote to his family; and the governor, on his part, despatched a messenger to Europe to relate the extraordinary circumstances that had occurred, and demand instructions as to how the Duke of Modena should be treated. Six months had flowed past, and no answer

was received by either. The political crisis in the meantime had gone by, and the inhabitants of Martinique began to find the residence of their royal guest somewhat expensive. The prince himself, after having spent 50,000 crowns of the Penthièvre funds, at last grew weary of his adventure; and in another month he hoisted an admiral's flag in a merchant ship, and, saluted by the cannon of the fort, took his departure for Portugal, with all his household, an almoner, and the king's physician at the colony.

Immediately on his back being turned, the long-expected courier arrived, bringing an order to the governor for the arrest of the stranger! By the same vessel the agent of the Duke de Penthièvre received a severe reprimand for his want of caution in allowing himself to be fleeced of so large a sum; the duke, however, in consideration of all the circumstances, retaining him in his employment, and consenting to share the loss. Both these communications were very extraordinary. The order for the arrest, after a delay of six months, and presented only when the prince had left the island, appeared to indicate that the whole affair had been nothing more than a youthful frolic; and this seemed so fully confirmed by the otherwise unaccountable good-nature of the duke, that public opinion ran stronger than ever in favour of the young knight-errant.

This personage in due time arrived at Faro in Portugal, and was there received with a salute of artillery. On landing, he demanded to be provided with a courier, to send to his chargé d'affaires at Madrid, and likewise with the means of proceeding with his suite to Seville, where he intended to await the return of his messenger. All was complied with; and the prince, still living on borrowed funds, was the gayest of the gay, drinking, dancing, and making love so vehemently, that he became the envy of all the men, and the admiration of all the women. His entrance into Seville was like a triumph. The windows were crowded as he passed; the principal inhabitants waited upon him to pay their respects; and sumptuous entertainments were prepared for him; all of which he returned with a magnificence conformable to his rank. In the midst of this there came a new order for his arrest.

The prince was astonished, the people indignant, and the women, more especially, furious. He had taken up his abode at the convent of the Dominicans, who protected him for some time, but at length, on the fermentation becoming serious, consented to deliver him up to the authorities, provided this could be done without bloodshed. One attempt to take him was defeated by the courage of the youth, who defended himself with his sword; but at length a burly monk, who was accustomed to wait upon him at table, clasped his arms round him one day as he sat at dinner, and held him till the alguazils, rushing into the room, took him prisoner.

He was at first thrown into a dungeon, and strongly ironed; but the next day, for no reason that could be imagined—for he had haughtily refused to answer all interrogations—he was released from his irons, and lodged in the best apartment in the prison. The persons composing his retinue, however, were treated with less ceremony; they were examined regarding a supposed conspiracy to seize the island of Martinique, and banished from the dominions of Spain. The prince himself was ultimately condemned to the galleys.

When the time came for his removal to Cadiz, it appears that apprehensions were entertained of a commotion in his favour. The whole garrison of Seville was under arms, and the prince, supported by the captain and lieutenant, entered a carriage drawn by six mules, and proceeded through the town between two ranks of infantry which lined the streets. Opinions were still divided as to his pretensions to the ducal throne, and bets to the amount of 60,000 piastres depended upon the question. The extraordinary thing was, that there came an order from the court to prohibit the laying of

wagers; and, more extraordinary still, the messengers sent off by those who had money at stake, to decide the whole matter by finding him whom they supposed to be the real duke, were unsuccessful. No Duke of Modena was to be found in Italy!

Arrived at Cadiz, the prince was conducted to the fort of La Caragna, the commandant of which was instructed to treat him with *politeness*; and here he lived very comfortably for a time, busying himself in making such presents as the sale of his effects enabled him to afford, to those from whom he had received kindness in the course of his strange adventures. But the romance was at an end: the real Duke of Modena had been at length found; and our paladin, growing tired of a life without notoriety and without excitement, made his escape.

Soon after this, the captain of a merchantman which had come to anchor in the roads of Gibraltar went on shore, and reported to the governor that he had on board the individual who was so well known by the title of the Prince of Modena. 'Let him beware of landing then,' replied the governor, 'or I shall apprehend him immediately!' The captain looked perplexed. He returned slowly to his ship, weighed anchor, and set sail; and with him disappeared for ever this singular young man, as completely as a bubble vanishes from the face of the sea.

There are few of the monstrosities of romance which equal in wildness and improbability the above transcript from real life. The series of coincidences which favoured the imposture, and the numerous mistakes as to the personal identity of the hero, committed by persons who knew, or affected to know, the real prince, seem little less than miraculous; while the moderation of the Duke de Penthièvre, and the tenderness exhibited by the court towards a convicted felon, throw around the whole story a romantic mystery, which, at this distance of time, it would be vain to attempt to penetrate.

ARTIFICIAL COLD.

SINCE the days of that dissipated heathen who, in order to cool the air during an oppressive summer, caused mountains of snow to be piled up, and suffered them to melt away, down to the present era, in which there prevails a rage for the thing, mankind has been incessantly in quest of refrigeratives. In those regions where ice and snow are found during winter, it became an easy expedient to store up such treasures of cold for use in warmer seasons; but where, if formed at all, they could only be of a momentary existence, it is manifest that some other means must be devised to supply the luxury of coldness to the noble and wealthy; and thus the art of artificial refrigeration—an art which has to boast of the elaborate researches of the ingenious Robert Boyle, and has occupied much of the consideration of other philosophers before and since—took its origin. We have already taken notice* of the now prevalent use and means of procuring beautiful ice for the table: we shall here present a brief sketch of the history, and a short notice of the methods, of producing cold artificially.

Cold, as a luxury, was far from being unknown to the ancients. The winter's snow or ice was rudely gathered up in heaps, or buried in pits, and covered with straw or chaff. But this was a wasteful, and grew to be an expensive method; and it became desirable to have ready means at every season, and independently of the accidents of the skies, for obtaining the same end. The simplest of these proceeded on the principle of loss of temperature, as a result of rapid evaporation. The Egyptians were accustomed to cool their water by placing it in earthen pitchers, the exterior of which was kept constantly wet by being sprinkled with water by slaves. It was the habit of one of their luxu-

rious monarchs to have several servants for this office alone, whose duties were to expose the water to cool on the summit of the palace, and constantly supply the royal table with the beverage. Cooling pits were also dug in the earth, into which the water-vessels were placed during the daytime; the exterior being well soaked with water, and then surrounded with the fresh leaves of a vine or other plant, evaporation rapidly went on, and the liquid became most agreeably cool. Another method is said to be mentioned by Plutarch, which was by casting into the water a number of small stones, the agitation and consequent evaporation produced by which would probably exercise a slightly frigorific power over the water. It was probably an accidental observation of what could not have failed to have been an everyday occurrence, that led to the next improvement in this method of refrigeration. Many of the earthen vessels of the Egyptians are made of unglazed ware: water placed in one of these was found to be considerably cooler than when kept in other vessels; and the more open and porous the material, the more rapid the transudation of the water, and its evaporation from the surface of the jars, and the greater the degree of cold obtained. Water-vases were then formed for that purpose solely; and the invention, unaltered in principle, has come down with increasing usefulness to the present time. Illustrations of the second great chemical law—that liquefaction produces cold—next followed. For ages in India, it had been the practice to cool beverages in that burning climate by dissolving saltpetre in water. From India the practice made its way into Europe; and Beckmann states that a Spanish physician, Blarius Villa Franca, practising at Rome, first introduced this method of producing cold in Italy about the middle of the sixteenth century. It is related that wine, placed in this mixture, was cooled to a degree making it almost intolerable to the teeth; and this was a considerable step in the history of artificial cold. Other saline substances came into use, and pits were formed, into which, on the large scale, the water to be cooled was put in vessels, surrounded by the cooling mixture. Finally came the important discovery, that an intensely-freezing mixture was capable of being formed by mixing snow or ice, and salt, together. A celebrated physician electrified a large audience by exhibiting its effects upon a bottle of wine, which he actually froze into ice; and 'this new method of freezing water' is also mentioned by Lord Bacon. Such are the conditions under which this subject has been handed down to existing posterity.

A little consideration of the processes described in this cursory sketch, of the chemical progress of the luxury, will show us that they are all reducible to the two axioms—that evaporation and liquefaction create cold. The philosophy of which facts is simply, that in the change of condition from a fluid to a vapour, and from a solid to a fluid, there is a change in the capacity for caloric. If a certain measure of water is to become vaporised, or if a certain weight of salt is to become a solution, these changes cannot occur without the water and the salt receiving an additional supply of heat, which is of course abstracted from all surrounding bodies; and the abstraction of heat being an equivalent expression to the production of cold, we are brought back to the truths with which we commenced, and have seen how evaporation and liquefaction produce cold. Caloric disappears in both cases, and, burying itself among the particles of the new product, is said to have become *latent*. There are some facts connected with the production of artificial ice which deserve mention here. The congelation of water is materially promoted by rapid motion. Water has, in fact, been cooled, and yet remained quite fluid, many degrees below the temperature at which it generally becomes ice; but the moment a little movement was communicated to the liquid, instantly the temperature rose to 32 degrees, and the mass became ice, needle-like crystals flying through its substance in a most curious manner. This

* No. 173 of our current series.

fact was seized upon by the refrigeratists; and repeated accounts of making artificial ice are extant, in which much stress is evidently laid upon the act of stirring the fluid to be frozen rapidly round with a stick. The experience of mankind also appears to have discovered that water, after it has been boiled, freezes more rapidly than otherwise. It is a custom among many nations of warm climates either to warm the water in the sun, or to boil it, previous to attempting to reduce its temperature. Dr Black of Edinburgh published some experiments undertaken to determine the question; and his results were, that boiled water does freeze a little more rapidly than unboiled. The act of boiling expels the air; and as in freezing a similar expulsion takes place, a step is gained in advance of the unboiled liquid.

The means in present use for artificial refrigeration are very various, some of them very interesting. Among these, the employment of porous earthenware may receive an early place. The Moors introduced into Spain this article of luxury, in the shape of very elegant vases, wonderfully light and porous. Water kept in these became rapidly deliciously cool, and, from some peculiarity in the process of the manufacture of the vessels, it acquired, in addition, a very agreeable flavour. In Egypt, and in India, and in most sultry regions, this expedient is at the present time a very prevalent one. It has also for some time been extensively employed amongst ourselves—porous wine, butter, and water coolers, of many elegant designs, being now produced at our potteries. But porous ware keeps water coolest where the clime is hottest, the very increment of heat being made to react in the production of cold by rapid evaporation. The Moorish name for their earthen jugs was *Alcarrazos*, or *Bucarroos*. The Arabs, burnt up with the eternal fire of their scorching country, make use of goat-skins for their water-vessels, which suffer a little water slowly to exude, and thus keep the remainder comparatively cool. A common method of cooling wines in India, is one which will almost appear a paradox: the bottle is wrapped in flannel wetted with water, and placed directly in the rays of the sun: violent evaporation ensues, and the wine actually becomes very cold. It is a common plan, too, for sailors, in warm latitudes, to cover their wine with cloths constantly wetted. Apartments are cooled on a similar principle, and an abundance of water is frequently dashed against the walls of the room with the most grateful effect. In India, also, the cold, so dangerous and penetrating on a clear night, is applied in a peculiar manner for the purpose of freezing water. Near Calcutta, in an open plain, there are large shallow excavations made in the ground, and filled with straw; upon this many rows of small, shallow, porous pans, filled with water, are placed at sunset. During the night ice forms in thin cakes upon the surface of these pans: it is carefully removed before sunrise, carried to a proper repository, and pounded into a mass there, and then covered over with blankets. This manufacture can only be pursued during the months of December, January, and February; and in the districts where the ice is formed in this manner, it is never produced naturally. This ingenious process must wholly disappear before the new import of Wenham Lake ice. What a revolution has commerce effected in India, when we remember that early travellers in that country were looked upon as liars and impostors for asserting the possibility of solidifying water into ice!

Where saline substances are cheap, the more powerful mode of refrigeration has been the use of the frigorific mixture. Some of these mixtures are capable of producing the most intense cold known to philosophy.* Dissolving saltpetre in water creates a very useful degree of cold; and where the salt is plentiful, as in India, it has long been employed for this purpose. It was the

peculiar duty of one domestic to cool beverages for the table by this means, who received the impregnated solution for his perquisite. Where, however, snow or ice is procurable, the intensity of the freezing mixture rises to its higher points. Snow and salt produce a mixture which was deemed by Fahrenheit to be of the greatest possible degree of cold. This was the temperature of his zero. Our confectioners are in the habit of using for their craft a mixture of pounded ice and salt. The substance known as chloride of calcium, mixed with snow, produces a most severe cold, sufficiently great to freeze mercury. Mr Walker, to whose interesting experiments upon this subject it stands much indebted, was on one occasion able, by successive coolings, to attain a depth of cold equal to 91 degrees below Fahrenheit's unhappy zero. In the laboratory of the chemist, great degrees of cold are procurable by the use of highly volatile liquids for evaporation. Every juvenile chemist's ears have tingled with the startling enunciation of the possibility of freezing a man to death in the height of summer, by wetting him constantly with ether—which is, however, a fact hitherto undemonstrated. The sulphuret of carbon, and, more recently, liquid sulphurous acid, both of them exceedingly volatile fluids, create intense cold by their evaporation. The almost magical experiments of M. Boutigny, in which water was frozen in a red-hot crucible, were effected by the assistance of sulphurous acid in the liquid form. The remarkable substance, liquid carbonic acid, takes the highest rank as a frigorific agent known. Mr Addams of Kensington actually manufactures this curious liquid as an article of commerce, and has occasionally as much as *nine gallons* of it in store. In drawing it from its powerful reservoirs, it evaporates so rapidly, as to freeze itself, and it is then a light porous mass, like snow. If a small quantity of this is drenched with ether, the degree of cold produced is even more intolerable to the touch than boiling water! a drop or two of the mixture producing blisters, just as if the skin had been burned. Mr Addams states, that in eight minutes he has frozen in this way a mass of mercury weighing ten pounds.

There have been some mechanical contrivances for the manufacture of ice. Evaporation may be accelerated mechanically to a degree so great, as to produce ice in considerable quantities, and this is the principle of Sir John Leslie's celebrated freezing apparatus. In conducting some experiments upon the rarefaction of air, he was led to conceive the idea of manufacturing ice on the large scale from a little phenomenon observed in the receiver of his air-pump. Introducing a watch-glass full of water, and in contact with sulphuric acid, into the receiver of his air-pump, and on making a few strokes with the piston, the water was converted into a mass of solid ice! With a body of parched oatmeal instead of the acid as the absorbent of moisture, he froze a pound and a quarter of water into ice. Experiments on the large scale followed; powerful machines were constructed, and various improvements were adopted in the apparatus, all tending to facilitate its application to the wants or luxuries of mankind. Several of these machines have been exported into hot climates. Dr Ure suggested steam as the vacuising power; and the idea has been conceived, that wherever a steam-engine is employed, there an ice apparatus might be erected and sustained at a trifling cost, with great prospect of productiveness.

The most recent ice-machine is 'Masters's Apparatus,' the principal feature of which is, that a metallic cylinder is made to undergo rapid rotation in a freezing mixture, the motion appearing in a singular manner to expedite and facilitate the process.

Some account of the applications of artificial cold may perhaps suitably conclude our paper. For some time the ingenuity of men in this particular developed itself no further than in simply cooling wine and other beverages; but a more refined and even elegant mode of doing so was afterwards discovered. In Boyle's 'History of Cold,' it is stated that he was accustomed to

* It will be noticed, that throughout this article the term cold is made use of for convenience sake, as if it indicated a positive principle, and were not, as it is, a mere negation.

make wine-cups of ice, by means of tin moulds, for use in hot weather: pleasant trifles, as he calls them, which imparted a delicious coolness to the wine poured into them. In an old romance, named the 'Argenis,' a dinner in summer is described, at which fresh apples half-incrusted with ice, and a basin of ice filled with wine, were among the curiosities upon the table. Then came the invention of water-ices by one Procope, an Italian, who had an immense sale for them in Paris. Cream ices, and the iced juice of fruits, were then made, and found a rapid consumption. More recently, the art of the confectioner has applied this process to imitate many kinds of fruit and peaches—apricots and nectarines of ice—copying the originals with curious fidelity.

FEMALE EDUCATION.

THE POSITIVE—THE POSSIBLE.

GREAT as are the improvements the last twenty years have seen in female education, and continually increasing as is the number of enlightened and faithful teachers who, having dedicated their lives to the work, carry it on with renewed success from day to day, it is still a melancholy fact that, in the majority of our schools, we find many of the old mistakes in full force, together with a general non-progressiveness of character which, to the thoughtful, becomes a subject for serious consideration.

To such as call to mind the days of back-boards and samplers, and knowing only the really good schools of to-day, rejoicingly draw a contrast between past and present, the assertion just made will probably appear both uncalled for and unjust. But that, unhappily, it is neither the one nor the other, increasing acquaintance with facts will testify. So far from wishing to obtain credit for her statement through undue weight attached to the facts on which it is based, the sole desire of the writer is to induce a more careful inquiry into what schools are, and a more earnest consideration of what they should be. Still, such facts as she may adduce—not being selected to serve a purpose, but chosen from the general number as most characteristic and expressive, and being all matter, not of hearsay, but of personal knowledge—deserve that degree of consideration which should be accorded to every contribution, however humble, to the cause of truth. It may assist the better understanding of the subject, if we take a particular class of schools, in order to indicate the traces of old errors still to be found in them; and perhaps those in which it will be most easy to demonstrate our position are the religious.

But before going farther, an attempt must be made to guard, if possible, against misconstruction. It is the primary article of the writer's faith, that however gifted or amiable an instructress may be, whatever her native powers or acquired accomplishments, she is unfitted for the charge of rational and immortal beings unless her heart, mind, and conscience be under the influence of religion. In speaking, then, of 'religious schools,' it must be borne in mind that it is to such as have taken to themselves the name, not such as we should be disposed to give it to, that reference is always made. These are sometimes farther characterised as 'evangelical.' Now, in the use of this word, we are influenced only by a desire of indicating to those who are conversant with them the class of schools referred to, and it is employed with as little of an invidious meaning as the terms 'preparatory' or 'finishing' would be, if they suited our purpose. However designated, perhaps the great mistake of the schools in question consists in this, that religion, which they are undoubtedly right in making their first object, is so formally and unattractively presented, so restlessly obtruded at all times and seasons, and so connected with pain and discomfort, that unless a strong interest has been already gained for it in the more genial atmosphere of home, the best result we can hope for is—indifference,

and that which we shall most commonly find—dislike. For it will not be asserted, that to bring tired children in from a long walk—where, if really desirous to improve, they are just beginning to arrange how to make the best of their time—and summoning them all around you, to read six consecutive chapters from the Bible—prophecy, history, genealogy, or doctrine, just as it may happen—are the means best calculated to give a love for the Scriptures. Or that, after prolonging lessons for an hour and a-half before breakfast, to keep them kneeling a quarter of an hour or more on a cold morning, whilst you are pouring forth prayers which, however true of your individual soul, are without meaning to youthful hearers, is the most hopeful way of leading their hearts to God. And yet these are the established usages of religious schools. One verse from the Bible, chosen with reference to time and place—one heartfelt aspiration, poured into the ear of a child whose heart was tuned to receive it—would do as much good as these well-meant but ill-judged attempts do harm. Nor are they the only customs that appear injudicious. The habit of learning from the Bible as a lesson, of being hurried to church twice in the heat of the summer day, and reproved for the consequent bodily weariness, as if it were a moral crime; the dullness and gloom of Sundays, the formal preachments made on the slightest occasions, and the unfortunate practice of meeting children at every turn with no lighter argument than the Day of Judgment—all these are mistakes more generally made, and more serious in their consequences, than any who are unacquainted with the subject practically can well imagine. So little knowledge of the child's nature is sometimes shown, that an 'Essay on Faith' has been required as a vacation lesson from a whole school, including at least two little girls under eleven. Now, if this had been imposed only on the advanced pupils, by whom the subject was understood and felt, and the younger ones suffered to write on some other subject within their comprehension, no fault could have been found. But imagine unfortunate little beings suddenly stopping in the midst of some game to which they have given their whole heart, and vainly striving to recollect some text, or fragment of a text, that may stand in place of original ideas, and fill a decent page in the theme book! Imagine the utter dislike they will feel to such subjects for years to come. Teachers seldom fail to see this dislike, but for the most part attribute it to natural perversion and innate depravity. God knows, there is enough of both in every heart, however comparatively innocent; but the question is—Is the right means taken for removing it? And to some of us the farther question arises—May not the mistakes of the teacher help to confirm the wrong feelings of the child? Again: in many schools deceit is effectually taught by the system of espionage maintained over letters. If children are told to say just what they like, but know at the same time that every word they do say will be overlooked, they will, either consciously or unconsciously, be hypocrites in the writing. They cannot fail to say what is likely to give pleasure or gain favour; and going in time a step farther, when communications of a contrary nature have to be made, a piece of paper will be slyly slipped in after supervision of the original letter.

And yet, under these influences are brought up every year a large number of children, whose parents, thinking they have secured for them the inestimable benefit of a sound religious education, vainly hope to see springing up in their hearts that good seed which, for want of due preparation of the soil, has never taken root. Happy is it if they do not find in its place indifference, callousness, deceit. Now it seems impossible that intelligent parents, and honest but mistaken teachers, should meditate on these evils without feeling that they must be removed, at whatever cost or effort.

It is to such I address myself in the following attempt to determine how many of the errors that belong to our present school system are essentially inter-

woven with it, and how many only make part of it by accidental association; in short, to set the positive in the light of the possible.

In doing this, we require one principle given; namely, that schools are a substitute, and at best a poor one, for home training, which, when attainable with few or none of the inconveniences commonly attached to it, we hold to be the perfect mode of education, the normal state appointed by God; and which, therefore, we may not change without weighty and sufficient reasons.

This principle granted, and the school admitted to be a substitute for the home, a good school is that in which the best features of the home are copied, and its highest advantages secured. By this practical test the merits of the system may be tried, and the causes of failure indicated, if failed it have.

I. In the first place, if a school is to resemble a home, some proportion must exist between the numbers contained in both. And here I should observe, that I am speaking altogether and entirely of female education, and of education as apart from, and above, mere instruction. Large public schools for boys are, by common consent, one of the many necessary evils with which the world abounds. With these, therefore, we have no desire to meddle. But desirable as public spirit and hardihood may be for boys, they are not the objects we propose to ourselves in bringing up our daughters; neither for them do we make the attainment of intellectual excellence our first desire. On the contrary, the culture of the domestic affections, the formation of the character, the strengthening of that heroic, self-denying element which is the basis of a woman's nature, and which enables her to find in duty its own motive and reward, and to do right for the right's sake—these are the ends every thoughtful parent would seek to pursue in the education of his daughters. As much intellectual attainment, as many external accomplishments as may be consistent with these, he will desire, and no more. Now the home influences, where the moral atmosphere is pure, will be found precisely adapted to secure these ends. The parental affection in which children 'live, move, and have their being,' tends to develop the feeling of love in their young hearts; whilst the deep interest of the parent must quicken his comprehension of the individual character of the child, and teach him how to bring about that peculiar combination of qualities which he desires to see him possessed of.

These being some of the peculiar characteristics of home education, it is at once evident that a large school can never supply its place; for the affection and interest with which each child is regarded by the 'principal' must be infinitesimal, even if, as too often happens, the feeling of individuality is not lost sight of altogether. If a school, then, be intended to supply the place of the home, it must be sufficiently limited in extent to admit of the same close study of individual character, and will differ chiefly from the natural home in bringing together companions nearer of an age than can possibly be found amongst brothers and sisters. In this respect, and in this only, the school has necessarily the advantage. Many children, studying single-handed, find a degree of dulness in their occupations which would be quickly removed by the presence of companions. Again: unless two or three sisters are very nearly of an age, the consequence of teaching them together is, that the elder is kept back, and grows idle; or, more probably, that the powers of the younger are overstrained. Now, it is by no means asserted that many girls of twelve are incapable of studying with sisters two or three years older—for age is by no means synonymous with power, there being greater capability in some at ten than in others at fifteen. Still, the rule of course is, that fellow-students of the same age are preferable. Moreover, all wise teachers know that children often gain from each other, both mentally and morally, fully as much as it is in the instructor's power to bestow. Difficult as it is to make this clear to any who have not studied education practically, by those who have, it will be readily

admitted, because the philosophy of it is rightly understood.

II. The first point being established—that a school must resemble a family in extent—the second is naturally connected with it—that its mode of government shall be the same; namely, patriarchal. That all large schools are despotisms, is by no means asserted; but that they have a natural tendency to become so, can scarcely be denied. In legislating for numbers, recourse must be had to rules, regulations, formulae, and other mechanical substitutes for personal direction; whilst every school not larger than a family might be governed, as all wisely-ordered families are, almost, if not altogether, by principles. Each member might feel herself the object of the watchful care and affectionate interest of the head, and might partake as largely of the infusion of her spirit. But this is only possible on the supposition that her heart is loving, her judgment sound, and her energy unfailing.

III. In the third place, every head of a school who undertakes to supply the place of home education, must have deeper views of what is required from her, and be more far-sighted with regard to the future, than the majority of our teachers at present are. A school is too often a mere intellectual mill, employed in grinding out of unfortunate children a certain quantity of labour for present purposes. Lessons appear to be learned in order to be said, and said to be speedily forgotten. Candour, however, requires us to admit that the whole of this mistake is not to be charged to school-mistresses; parents often, by their ill-judged desire to see their children advance rapidly, adding fuel to that flame by which the powers of young minds are wasted and destroyed. On both sides there is a want of that wise economy by which the immediate results of intellectual efforts are made a part, and but a small part, of the advantages to be derived; the chief gain being the moral discipline involved, and the power this gives for future years; or, to confine our attention to the intellect, the sharpening and strengthening of the faculties, rather than the immediate knowledge they are the means of procuring. Now, the great intellectual mistake in many schools is, that there is no working for the future. Young people are not shown practically that all their studies and pursuits are mainly valuable for the promise they hold out, and the facilities they afford, for future attainments. Could we show them in the present the germ of the future, and make it clear to their minds how much their happiness here and hereafter depends on the faithful fulfilment of those simple duties which they are accustomed to regard as mere indifferent routine, how much more lifelike and earnest would be their daily employments! Common situations, and unromantic circumstances, would then content them; for into the meanest they would see the possibility of carrying all those great deeds and high thoughts which they have revered in others, and perhaps sighed for in themselves. Their life would thus become a connected whole, instead of in its two periods offering the slavery of school, and the emancipation of leaving it, with nothing to show the oneness and reality of existence. There can be no doubt that, if judiciously attempted, it will be found possible, without making young persons prematurely thoughtful, to show them the close connection between those two stages of education which they have been accustomed to think so different—the school-teaching, and the life-teaching. A wise teacher will do even more than this. Foreseeing the end of all her efforts from the very beginning, and gradually approximating towards it by slow degrees, in proportion as she finds the power of self-guidance developed, she will remove external motive and stimulus, and so prepare the mind to depend on itself, that, when the period arrives for losing sight of authority altogether, the change shall be in many important particulars imperceptible.

Neither is it necessary that young women should leave school, as they often do, with little preparation

for the active duties of life. No other law but the absurd one of fashion has laid down the cultivation of all kinds of useless and frivolous needlework, to the exclusion, in many cases, of that particular branch in which every woman should be well practised. The period of life passed at school is that on which future happiness and usefulness mainly depend, it being during the course of this that habits are, to a certain extent, unalterably formed. To accustom young people, therefore, exclusively to the use of Berlin wools and floss silks, is to preclude the hope of their being, in one important particular, useful mistresses of families.

rv. Are schools and school-life necessarily and unavoidably the dull, formal, *negative* things we commonly find them? May not the cultivation of a loving spirit in the young people, together with constant cheerfulness, intelligent conversation, and an animated manner in the principal, help to make a school-life a happy and pleasant one—inferior to home only in the one great particular, of separation from relatives?

In the present administration of schools, one of the principal mistakes arises from the fear of giving too free a course to that natural reaction, that exuberance of spirits, which is found to follow close attention to study. Now, as certainly as we must relax the bow before we can hope to see it firmly strung, so surely does earnest study require at intervals the most unbounded freedom, the most unrestrained enjoyment of every rational and harmless amusement. Children who do not play with all their heart, are seldom found to learn with all their might; whilst in those who do, the energy and vitality of the playground will accompany the mind to the study, unless some chilling influence meet it on the way. Of refreshing, inspiriting amusements, bodily as well as mental, children at school have too small a share. They are for the most part characterised by a grave dullness of character, a dignified nonchalance of manner, which, painful as we feel it in all, is absolutely hopeless in the young: for it is one of the surest indications of that solemn listlessness which gives us the peculiar specimen of animated nature so puzzling to many of our philosophers—the young lady from school. Under a more lifelike and enterprising government, this negativity of character would cease to exist. The peculiarities of individuals would be cherished and rejoiced in; and school girls would no longer be distinguished from their fellow-mortals by the habit, when dining in tolerably large numbers, of asking for the wing of a fowl all round the table. In all seriousness, we do desire to see a less *generic* character in the young, who have years enough before them, with no lack of influences, to wear them down to the customary degree of conventional commonplaceness. But this desirable change will not be effected so long as the formal walk for an hour in the day, and the dance in which the posture-master's frown is feared, are held relaxation sufficient for young minds and limbs. Not merely walking, running races, and every game that can be pursued out of doors, but gardening, botany, excursions, visits to manufactories, &c. will help to give a definite object to our exercise, and thereby preserve us from lassitude; a state, by the by, so unnatural to the young, that we never see it—except in the single case of ill-health—without mentally laying the blame on the seniors in charge.

v. The chief points connected with the wellbeing of schools are, undoubtedly, the four we have been attempting to consider; namely, extent, government, purpose, spirit. Many practical points will, however, be found to have great influence on their success; such as choice of situation, arrangement of time, &c. With regard to the former, I feel no hesitation in saying that every school should be, if not quite in the country, still so near it, as to admit of much time being spent every day in the fields and lanes, and without the annoyance of passing through crowded streets in order to reach them. Indeed, unless insurmountable difficulties are in the way, every school should be not only near, but

in the country; for health and happiness are both involved in making the most not only of the hour, or hour and a-half, devoted to a walk, but of the fragments of time which are constantly occurring between studies, and before and after meals. There is, moreover, an invigorating influence in constantly breathing pure air, the absence of which is poorly compensated by all that a large town has to offer in the shape of lectures or exhibitions. But the advantages of both may be partially united by a situation in the country, in the immediate neighbourhood of a town. And in cases where this is not attainable, which will form the majority, the loss of all town advantages is more than made up to us by any picturesqueness the neighbourhood may afford. To teach a child to love nature, is far more important than to make her a connoisseur in works of art; though, unfortunately, it is less understood. It can only be effected by living in the midst of fair scenes, and keeping the heart always open to their influence. If this advantage be once given, little positive teaching will be found necessary; there being a secret affinity between the freshness of young hearts and the joyousness of nature, by which all our attempts at formal introductions are felt to be wholly gratuitous. It is because this is imperfectly, if at all, understood by many teachers, that young people are often charged with being idle, when they are in reality full of thought and feeling. A child lies down under a shady tree, and shuts his eyes to feel the sweet breath of summer; or looks up into the interwoven branches, and wonders why they seem to be in the sky, and why the sky looks like another sea, and wherein sky and sea differ from each other, until he loses himself altogether in reverie. The teacher finds him thus engaged, and because he is neither conjugating, nor calculating, nor poring over book or map, pronounces him idle. Now, it would be most absurd to dream of children's spending their time either entirely or principally in this desultory manner, when the advantages of regular employments are known to be invaluable. Still, it is both unjust and unwise to confound together two things so utterly distinct as the love of nature and the love of idleness.

vi. With regard to the arrangement of time, a few practical hints will best explain what is meant.

Work should be always close and earnest, but not too long-continued. Two hours are, perhaps, the longest time children should ever be allowed to study without some interval of rest longer or shorter. For very young children, even this is too much. They cannot give their *best* attention so long; or, if they can, that is the strongest of all reasons for never suffering them to do it on any pretext whatever. Intellectual studies should occupy the hours of the morning; music and drawing those of the afternoon; and the evening should be given to work, amusing reading, chess, and all games that afford either exercise to the limbs or relaxation to the mind. It is the time for establishing a cordial sympathy between all the members of a family, by leading each to employ his peculiar talent for the benefit of the rest. All attempts to make the day begin and end with work are, therefore, mistakes, and deserve to be as unsuccessful as we invariably find them. We are not sent into this world *only* to learn Greek, and Latin, and '*theologies*'; but to comfort and be comforted, to bless and be blessed. The child whose last thoughts every night are of grammars and lexicons, will make but an ungenial companion in after-life. In female education more especially, where the moral and spiritual culture is all-important, this truth must be carefully borne in mind.

One word in conclusion, to explain the earlier pages of this paper. Religious schools were selected for notice as being more numerous, more influential, and more generally believed in than any others. The follies of fashionable seminaries, and the sins of intellectual hothouses, have already been so fully exposed, that little faith can remain in them among the intelligent: whilst the existence in religious schools of the mis-

takes we have attempted to point out, is wholly unsuspected by the majority of parents, and can never have been duly considered by the teachers themselves.

And now, with a full conviction that the foregoing observations, however crude in form, are true in substance, the writer commits them to the earnest consideration of all concerned in education. She is conscious that many other particulars might have been brought forward, and many truths more clearly indicated. But this has happened intentionally, and not by accident. Her object is to suggest merely, to throw on the subject just as much light as will serve to guide those less practically conversant with it; and to point out to any who have been working without reflecting, the greatness of their responsibility for good or for evil.

A STORY OF APSLEY HOUSE.

ONE fine autumn day, in the year 1750, as his majesty George II. was taking a ride in Hyde Park, his eye was attracted by the figure of an old soldier, who was resting on a bench placed at the foot of an oak-tree. The king, whose memory of faces was remarkable, recognised him as a veteran who had fought bravely by his side in some of his continental battles; and kindly accosting him, the old man, who was lame, hobbled towards him.

'Well, my friend,' said the monarch, 'it is now some years since we heard the bullets whistle at the battle of Dettingen: tell me what has befallen you since.'

'I was wounded in the leg, please your majesty, and received my discharge, and a pension, on which my wife and I are living, and trying to bring up our only son.'

'Are you comfortable? Is there anything you particularly wish for?'

'Please your majesty, if I might make bold to speak, there is one thing that would make my wife, poor woman, as happy as a queen, if she could only get it. Our son is a clever boy, and as we are anxious to give him a good education, we try every means in our power to turn an honest penny; so my wife keeps an apple-stall outside the Park gate, and on fine days, when she is able to be out, she often sells a good deal. But sun and dust spoil the fruit, and rainy weather keeps her at home; so her profits are but little—not near enough to keep our boy at school. Now, please your majesty, if you would have the goodness to give her the bit of waste ground outside the Park gate, we could build a shed for her fruit-stall, and it would be, I may say, like an estate to us.'

The good-natured monarch smiled, and said, 'You shall have it, my friend. I wish all my subjects were as moderate in their requests as you.' He then rode on, followed by the grateful blessings of his faithful veteran.

In a few days a formal conveyance of the bit of ground to James Allen, his wife, and their heirs for ever, was forwarded to their humble dwelling. The desired shed was speedily erected, and the good woman's trade prospered beyond her expectations. Often, indeed, the king himself would stop at the Park gate to accost her, and taking an apple from her tempting store, deposit a golden token in its place. She was thus enabled to procure a good education for her son, who really possessed considerable talents.

Years rolled on. George II. and the veteran were both gathered to their fathers; but Mrs Allen still carried on her trade, hoping to lay up some money for her son, who was become a fine young man, and had obtained a situation as head clerk in a large haberdashery establishment. He lived with his mother in a neat, though humble dwelling, a little way out of the city; and thither he hoped soon to bring a fair young bride, the daughter of a Mr Gray, a music teacher, who resided near them. 'Sweet Lucy Gray!' as her lover was wont to call her, had given her consent, and the happy

One morning, however, when Mrs Allen proceeded as usual to her place of merchandise, she was startled to perceive the space around her fruit-stall filled with workmen conveying stones, mortar, and all the implements necessary for commencing a building. Some were standing round the shed, evidently preparing to demolish it. 'Come, old lady,' said one of the men, 'move your things out of this as fast as you can, for we can do nothing until the shed is down.'

'My shed!' she exclaimed; 'and who has given you authority to touch it?'

'The Lord Chancellor,' was the reply; 'he has chosen this spot for a palace that he is going to build, and which is intended to be somewhat grander than your fruit-stall. So look sharp about moving your property, for the shed must come down.'

Vain were the poor woman's tears and lamentations; her repeated assertions that the late king had given her the ground for her own, were treated with ridicule; and at length she returned home heart-sick and desponding.

Misfortunes, it is said, seldom come alone. That evening Edward Allen entered his mother's dwelling wearing a countenance as dejected as her own. He threw himself on a chair, and sighed deeply. 'Oh, mother!' he said, 'I fear we are ruined: Mr Elliot has failed for an immense sum; there is an execution on his house and goods, and I and all his clerks are turned adrift. Every penny we possessed was lodged in his hands, and now we shall lose it all. Besides, there have been lately so many failures in the city, that numbers of young men are seeking employment, and I'm sure I don't know where to turn to look for it. I suppose,' he added, trying to smile, 'we shall have nothing to depend on but your little trade; and I must give up the hope of marrying sweet Lucy Gray. It will be hard enough to see you suffering from poverty without bringing her to share it.'

'Oh, Edward,' said his mother, 'what you tell me is bad enough; but, my poor boy, I have still worse news for you.' She then, with many tears, related the events of the morning, and concluded by asking him what they were to do. Edward paused. 'And so,' said he at length, 'the Lord Chancellor has taken a fancy to my mother's ground, and her poor fruit-stall must come down to make room for his stately palace. Well, we shall see. Thank God we live in free, happy England, where the highest has no power to oppress the lowest. Let his lordship build on: he cannot seize that which his sovereign bestowed on another. Let us rest quietly to-night, and I feel certain that all will yet be well.'

The following day Edward presented himself at the dwelling of the Lord Chancellor. 'Can I see his lordship?' he inquired of the grave official who answered his summons.

'My lord is engaged just now, and cannot be seen except on urgent business.'

'My business is urgent,' replied the young man; 'but I will await his lordship's leisure.'

And a long waiting he had. At length, after sitting in an anteroom for several hours, he was invited to enter the audience chamber. There, at a table covered with books and papers, sat Lord Apsley. He was a dignified-looking man, still in the prime of life, with a pleasant countenance and quick penetrating eye. 'Well, my friend,' he said, 'what can I do for you?'

'Your lordship can do much,' replied Edward; 'yet all I seek is justice. You have chosen, as the site for your new palace, a piece of ground which his majesty King George II. bestowed on my parents and their heirs for ever; and since my father's death, my mother has remained in undisturbed possession. If your lordship will please to read this paper, you will see that what I state is the fact.'

Lord Apsley took the document, and perused it attentively. 'You are right, young man,' he said; 'the ground is indeed secured to your family by the act of

believing it to be a waste spot, but I now find I must become the tenant of your surviving parent. What does she expect for it?"

"That," said Edward, "she is satisfied to leave to your lordship. We are confident that the chief lawgiver of our country will do what is just and right."

"You shall not be disappointed, young man," replied the chancellor. "I was offered a site for my palace, equally eligible, at a yearly rent of four hundred pounds. That sum I will pay your mother, and have it properly secured to her heirs for ever."

Edward thanked his lordship, and respectfully withdrew.

Before a week had elapsed, his mother was established in a neat and comfortable dwelling in one of the suburbs; and ere two had gone by, sweet Lucy (no longer Gray) might be seen in the sunny little garden filling a basket with the fruit of a golden pippin-tree, which the old lady pronounced to be almost as fine as the apples which his gracious majesty King George II. was wont to select from her stall at Hyde Park Corner.

And thus it came to pass that the stately mansion of England's warrior-duke is subject, at the present day, to a ground rent of four hundred pounds a-year, payable to the representatives of the old applewoman.

RECOLLECTIONS OF SARDINIA.

In the year 1847, the Mediterranean is covered with steamboats: the united genii of steam and wind hurry forward the traveller for business or pleasure with absolute certainty to his destination, and without his being obliged by the way to dispense with either a good dinner or a clean bed. But ten years ago, men and things in the south still went on in their old way. Steamboats were then confined to the line between Marseilles, Malta, and Constantinople; and the communication between the outlying ports and islands was still kept up principally by small half-decked sailing-boats, lateen-rigged, and from thirty to forty tons burden, the passengers by which found their own provisions, and for bed and accommodation got on as they could—that is to say, very badly. The variable winds of the Mediterranean often made this mode of transit a great trial of patience; but it was the very best way to see and study the magnificent coast scenery. From the exceeding depth and transparency of the atmosphere, the mountain back-grounds in the interior, at the distance of very many miles, stand out startlingly near and distinct to the eye, forming, with the infinite sea, the framework to a landscape which every change of the bark, as it creeps by the shore, constantly varies and renews, while it gives time enough for each characteristic curve and blending of the sea and land to impress itself unchangeably on the memory. The steamboat traveller goes straight to his point; but he sees nothing of this. Comfort and expedition are his object, and he obtains them; but it is at the expense of all the essential beauty of the voyage.

We embarked at Bastia in the felucca Giustina, on the second day of July, and it was the ninth before we reached Cagliari in Sardinia, a distance of three hundred miles; for during half the time the air was motionless, and we lay roasting on the smooth swell of the Mediterranean under an almost vertical sun. Every afternoon, about four o'clock, it lightened, but without thunder; and from this the horizon was in a blaze till sunset, when short interrupted squalls came on with rain, and lasted till midnight. On the evening of the seventh day, we brought to in the magnificent bay of Cagliari, among a fleet of fishing-boats. It is worth a week's confinement on board to feel the rapture of exchanging the eternal pitching and rocking of a small vessel for the motionless earth, especially when one has been living in the midst of dirt indescribable, on hard pears, indigestible fowls, garlic, and ship's biscuit. Our hotel, when we reached it, was anything but a

palace—a stone edifice of two storeys in height, very large and dirty, built in a square, with a court in the middle, and galleries all round the sides. On the left, as we entered, was a large hall, like the salles in France and Belgium, with great heavy blinds at one end that admitted air, but no light; and at the other end an open staircase, inlaid with some kind of yellow wood, leading to offices and bedrooms. The hall was full of men, short, mahogany-coloured, and with faces half-buried in hair, with here and there a naval or military uniform among them, seated in groups at little round tables, smoking, gaming, and drinking wine and lemonade. We took some wine, and went to bed, being very tired, where we managed finally to sleep in spite of the noise, which seemed to go on just the same all through the night.

Cagliari, like most Mediterranean towns, is striking without, and infamous within. An amphitheatre of houses sweeps round the bay, tier rising over tier about two-thirds up the sides of a conical hill, four hundred feet high, very glorious to the eye, but very tiring to climb. Within, the streets are narrow and mean, paved with small pitching stones, set obliquely with the points turned upwards; at every third or fourth house a clothes-line dangles with linen hung out to dry, the only sign of washing observable during our stay, for the dirt is universal, and surpasses language to describe. A traveller fresh from home is struck with the completely Italian look of the place: the houses lofty, and with colonnades, the shops full of garlic, sausages, and little figures of saints. There are several remarkably handsome churches, crammed full of votive offerings. There is a spacious cathedral, with a façade composed of solid slabs of white marble; and another, nearly as large, having a multitude of side chapels, one of them illustrious in the island for a giant picture of Anti-christ and his followers, represented in the various shapes of dogs, wolves, and bears, among whom Luther, Beza, and Calvin figure conspicuously. But these stately edifices add little to the general effect, being built up with the meanest class of shops reared against their sides; nor are they such as would attract much notice among the like kind of structures on the continent. The real interest of a city like this lies in its men and women.

In Sardinia, every one wears a different dress, according to his district. The people of Cagliari dress differently from those of Sassari; the natives of the highlands from those of the lowlands; the peasantry of one parish from those of the next. Compared with our own sober-vested population, among whom every male above the rank of a labourer wears a frock-coat and round hat, a town like this looks like a tulip bed. Some of the men wear a large hat, with a party-coloured handkerchief bound tight round the head, the corner hanging down behind, and a close waistcoat of tanned leather folding on the breast, and reaching nearly to the knee. That huge swarthy fellow, with his bare neck burnt almost to a brick-dust hue with the sun, in a jacket of goat-skin, and a highlander's bonnet covering his matted hair, has just come down from the mountains a dozen miles off, to sell his winter's store of wild-boar's hams in the metropolis, and is chaffing with a citizen in a flaming red bonnet, and black kilt falling gracefully over his scanty under-garments, and fastened at the collar with silver buttons. They have commenced amiably; but at each interchange their voices are getting an octave higher, and the highlander's hand is clutching mechanically at his knife. Standing in a group by themselves are a number of sturdy, thick-legged, mahogany-coloured mountain-women, loaded with fruit and vegetables: as they glance at the cloaked and hooded cittadini, what a pride they evidently feel in the contrast presented by their flaming scarlet stockings, and bright yellow cloth caps with scarlet borders, and immeasurably full petticoats starting forth with a swirl from the hips, like the pictures of our grandmothers when hoops were the fashion. The ladies dress in caps

and bonnets here as elsewhere; but the citizens' wives still remain faithful to the ancient white Greek veil, thrown gracefully over the head and shoulders, contrasting admirably with the deep, dark flashing eyes, and pencilled classical lineaments, which strongly mark their Grecian origin. Many of these women are perfect models in face and figure, and would be fascinating, but for those unnameable coarsenesses too common to the women of the south, but revolting to an Englishman.

It is not at every hour of the day, however, that such groups are to be seen. From sunset till sunrise the place is as a city of the dead, all who can do so keeping within doors, with closed windows; or if compelled to go out, muffling themselves carefully up with a bandage drawn completely over the mouth, for fear of the malaria, which is worse here even than in the lowlands of Rome, and has been known to prove fatal within twenty-four hours. At mid-day, in like manner, the streets are empty, the *colpo di sole*, or sun-stroke, being almost as much dreaded as the malaria. Early morning, before the sun has come on, is the time for disposing of the little necessary business; and in the afternoon, by six o'clock, when the intense heat is in a great measure gone off, all the world is out to enjoy the short glorious twilight which accompanies the setting sun. The streets are full of people thronging to the shore; one fine one, especially, running along the head of the bay, along which the evening breeze is fast stealing up, as is evident from the shifting of the distant sails, and the broken glitter of the sunbeams where they strike upon the crisping and undulating waters. Groups of singers, with guitars and screaming flageolets,* draw out interminable love ditties; criers proclaim the last day's assassination; children bawl and romp; men smoke, swear, talk politics, and abuse their fellow-subjects across the water; women, stepping daintily to and fro, scream recognition to their acquaintances at the tops of their voices; the passionate southern temperament is at its full swing of vitality and enjoyment, when the boom of the evening gun is heard sullenly over all. In ten minutes the streets are once more full of gesticulating groups, trotting hurriedly homeward; and in ten minutes more their only occupants are here and there the solitary sentinels, to whose lot it has fallen to face the fatal whisperings of the night breeze, which brings death upon its wings.

A week was quite enough to give to Cagliari during the malaria season, when everybody that could do so was away and in the mountains. We paid our bill, after first having to resist and overcome the customary Italian propensity to overcharge; and after a similar conflict, succeeded in settling upon reasonable terms for the hire of three mules and a guide to take us across to Palmas, where our boat was sent round to meet us.

Accordingly, the next morning we were all prepared to set off. It was about four A.M.; we had packed up; the horses were all ready at the door, when the guide absolutely refused either to start himself, or to allow his horses to start: first, because it was Friday; and, second, because his dog had howled through the night! This was too bad, when he had received the whole sum agreed upon on the night before: but he was immovable for the time; and when, by threats and an additional carolinus, he was obliged to give in, an hour was already lost. The morning was dark, damp, and dreary, and a thick mist, full of all kinds of fever and malaria no doubt, hung over everything. The road first wound along the margin of the bay, and then diverged inland, running along the top of a causeway, between two great stagnant ponds, half mud, half water, steaming with malaria vapour. Gradually, the sun came out, and roused up an army of waterfowl, which passed us with a loud splash, and after them a band of scarlet flamin-

goes, slowly sailing out of sight. For the next five hours we were trotting doggedly forward under a sickening heat, over an endless level of plantation and desert. Rich fields of olives and sugar-canes, with palm-trees thirty feet high, and other tropical productions, met us here and there; but the greater part of the ground lay uncultivated, though capable of anything. Everything was still, through the intensity of the heat; the very lizards were silent; and twice only we passed a solitary peasant. Once we came upon running water; a luxury indeed; and once we passed, at a short distance from the country-seat of some absentee noble, a huge building like a manufactory, with the ground cut up in plots to the very door, and the cow-pens placed right under the bedroom windows.

The country still bore a very solitary aspect, until we turned sharply to the left, at the foot of a conical limestone bluff, and began to ascend by a paved road, cut in a zig-zag direction up the face of the hill. The spectacle from the top, stretching far and wide over the immense level we had just quitted, must ordinarily be very fine; but now, before us, and on either side, the vast plain of the Campidano lay literally steaming with heat, the mist floating palpably up into the transparent blue sky, and confusing everything to the distant Mediterranean, which was momentarily distinguishable by the flashes of sunlight reflected from its waves. As we looked, we could almost see the heat in the bottom, but now every step took us into a different country; and after half an hour's continuous mounting, we rode forth upon an upland plateau, with the short crisp turf under our feet, and heath flowers perfuming the fresh pure air of the hills. The vegetation here utterly changed; no more sugar-canes, plantains, and agavés, but plants of the north, beeches, ash, and evergreen oaks, with wild olive and cork-trees, sheltering a profusion of wild flowers and berries, especially a gorgeous strawberry of a deep orange colour. The peasantry, too, seemed altered for the better; blue eyes and fresh skins met us here and there, while down in the plains the men were short and thick-set, with large mouths and thick lips, black hair and eyes, and complexions like wash leather. The dress, too, was once more different. A peasant walking by my side—a gaunt, sinewy fellow, as upright as a dart, clad in dark-brown, with a sort of spiral cloth cap on his head—asked me if I did not admire a little girl, who was trotting before us, returning from some village fête, or more probably from confession. She was the daughter of some small farmer, and had on her best clothes—a complete suit of scarlet over a white petticoat flounced up to the knees, with long sleeves of scarlet cloth, down the sides of which were a double row of silver buttons, each as big as a crown piece: on her head she wore a triangular piece of scarlet cloth, tied down by a broad flame-coloured ribbon, and altogether looked like a bonfire. In this attire, without either shoes or stockings, she was dancing a-head at a great rate, occasionally turning round to laugh at us with her wondering large eyes, as we plodded on through stones and brambles fetlock deep in mud. During the rest of the day we rode through an open valley, enclosed by high lands; a sheet of the most glorious vegetation, but the beauty of which was made terrible by the multitude of short wooden crosses at every turn and nook, marking the scene of some deed of blood committed or attempted. At the close of the evening we entered a dark tree-shaded ravine, with a brawling brook rushing down the bottom, up which we threaded our way by a narrow road scarped out of the red earth of the hill-side; and presently emerging at the upper end, came out at once into the main street of Teulada, where we were to sleep for the night.

Teulada is a little out-of-the-way place, on a hill-side; but man's evil passions follow him everywhere, and even here, at the street end, was a freshly-constructed cross, commemorating, as we were afterwards told, a deed of peculiar atrocity. Two farmers of the neighbourhood, by names Alberto and Jacomino (literally, Little Jack),

* In Sardinia, called the *launedda*. It is made of three short pieces of wood, of unequal length, and for harshness surpasses any bagpipe.

had long been on bad terms, when they met by chance at a country wake, quarrelled, fought, and were ultimately reconciled with difficulty by the priest. Jacomino soon after left the country. Thirteen years afterwards, when both were verging on old age, some unlucky words persuaded Alberto that his honour called imperiously for revenge. He traced his enemy from Cagliari to Sassari, from Sassari to Marseilles, from Marseilles back again to Sassari, and finally shot him from an ambush on the present spot. The victim died at once, two balls having passed completely through his body; and the murderer was seized and executed, most justly, within a month afterwards, glorying in the spirit with which he had worked out his revenge, and regarded by his countrymen as a kind of martyr. This horrid spirit of revenge is the curse of Sardinia. No education, violent natural passions, a bad religion, and the worst possible laws, with the greatest one-sidedness and venality in executing them, have here created a state of things which can only be realised by imagining the state of the Highlands under the Jameses reproduced, with the added inflammation of an almost African sun. Throughout the island, the cittadini or inhabitants of walled towns hold the contadini or villagers in utter contempt, which the latter very cordially return: the highlanders look on the lowlanders as utterly degenerate, and beneath themselves in being; besides which, the people of Cagliari and Sassari have a standing hatred to each other. Many communes have been at feud with each other for centuries, and have entirely forgotten the original cause, if there ever was one. Every one goes armed to the teeth, and in consequence, in one year (1827) there were eight hundred and seventy-two assassinations in a population of four hundred thousand. The murderers generally fly to the mountains, and there become banditti—*malviventi* they are called—and in their turn, when the time comes, are hunted down like dogs by the regular troops. Lately, a disarming act has been passed, which may do something; but the evil lies deep in the misgovernment of centuries, which only centuries can repair.

When we came into the town, we found it in terrible confusion. A great hunt was to take place in the neighbourhood on the following day, and the people for miles round had poured in, and were squabbling for quarters in the streets. Our lodging, when we got one, was in the worst style a specimen of the wretched wine shops which it is the wanderer's lot to lodge in all over the south. The ground-floor consisted of one long room, serving for everything. In the centre of the room there was a square hole in the clay floor, in which was the fire, but the smoke had no outlet except through the door. The floor was of clay; the walls of mud, with a stone bench along one side; in the one corner was a large hand-mill for grinding corn; on the floor stood musingly an ass, a calf, and two pigs; and on the aforesaid bench sat the family—the host, his wife, and a little boy—with sundry cocks and hens. The landlord and ourselves supped out of the same bowl; the hostess sat apart, women never being allowed to eat with the men in Sardinia. We had food enough, substantial, though coarse—fish, flesh, fried pigeons, olives, artichokes, and a platter of small white snails stewed, a dainty in this island—with plenty of strong country wine.

The host himself was a good specimen of a Sardinian peasant—rough, but kind, shrewd, and especially inquisitive. England he had heard of from a Highland officer of the Malta garrison, who had strayed into this secluded corner the autumn before for the sake of the shooting. He recollected his father speaking of Lord Nelson's fleet when it came to water in the Bay of Palmas; and he had some vague notion of our steam-vessels and railways; but nothing would convince him that Tughiterra (England) was not the capital of London. Some specimens of manners I recollect we had in the evening, more peculiar than pleasant. One of us praised the child, which was really very pretty: the father immediately spat in its face, and crossed himself devoutly,

telling us he did so to avert the Evil Eye, which the praise might otherwise bring upon it. Again, on retiring for the night, we were obliged to kiss all round, or great offence would have been taken. The family slept on the floor; but we were allowed, out of special favour, to mount by a ladder into a wretched loft, swarming with fleas, musquitos, and worse, and full of broken furniture and earthenware, pans, pots, and sacks of Indian corn; in one corner of which stood a huge antiquated kind of packing-case, big enough for a dozen, and stuffed with leaves of Indian corn. This was the bed. About midnight it blew a tremendous storm of wind, with thunder and lightning, the hailstones, as big as eggs, battering on the roof like grape-shot; and when this was over, the cocks took up the tune, and crowed perseveringly till daybreak.

As it was quite evident there was to be no sleep, we got up before dawn, and dressed the best way we could. Some wine and eggs were soon despatched, and in ten minutes more we were trotting out of the town, along a path so narrow, that the boughs met over our saddle-bows, through a grand ravine of crags and dells, studded with woods of ilex, beech, cork, and wild olives, and seemingly swarming with game. Hares by dozens ran across our path; quails and partridges swarmed in the bushes, with many gaily-painted natives of the south, of which we did not even know the names. Presently we came upon a huge old boar, lying meditating by himself at the foot of a cork-tree; but we had barely a glimpse of him, as he rose and trotted off through the jungle. The path continued to mount, holding more to the southward over the hills, with the clear blue sea at a little distance on our left, and grew narrower and narrower, till at length it was barely possible for the mules to keep their feet. We persevered, however, having no alternative, and were enabled, before the sun had reached the meridian, to look down upon the Bay of Palmas, where our little bark lay waiting our arrival, a solitary speck upon the waters of this magnificent haven, which is capable of sheltering all the navies of Europe in its bosom.

THE ARISTOCRACY OF NAMES.

Our readers are aware that the strange thesis has been maintained before now, that 'private vices are public benefits;' and some may have wondered at the desperate ingenuity which could work evil into good by the simple rule of multiplication. But we live in a world of seeming anomalies; and however difficult their reconciliation may be, there is no doubt that the errors of individuals are overmastered in their collective tendency, and that we all, good, bad, wise, and foolish alike, co-operate, unconsciously, in the great work of human progress.

As a familiar illustration of what we mean—the philosopher smiles at the enthusiasm of the vulgar in their aspirations after an undefined and undefinable good they call the Gentle; but the philosopher may smile on, for the wisdom of the learned Theban is foolishness. Such aspirations are the beginning of all refinement. They lead, it is true, to the perpetration of innumerable caricatures; but these in time correct themselves, or are corrected by collision, till every day some individuals, rising gradually above the mass, ascend into the region of true taste—or what is taken for such by the present generation. And what is true of individuals, is true of nations, and of society at large. The history of manners and costume, or, so to speak, Fashion, is the history of virtue and intelligence. How many revolutions have we passed through, before reaching our present simplicity of attire! And how many horrors have we encountered, before subsiding into our present condition of comparative charity and peace! Our contemporaries

are better, as well as better dressed, than their ancestors; and our posterity will be better, and better dressed, than ourselves. Already our women have more elegance, and less bustle; and already our men have grown ashamed of their pig-tailed coats, not a thread of which will survive for their heirs-at-law. Already, in like manner, do we begin to pick up little thieves and beggars from the streets, to imprison them in schools, instead of contaminating them in jails; to turn them to knowledge and industry, instead of confirming them in ignorance and crime; and to lead them on to public usefulness, rather than the hulks and the gallows. Condemn not, therefore, the vulgar-genteel any more than our ancestors, for, like the latter, they are pilgrims on the road, and their very errors are paths that lead to truth.

But there is one thing in the general bearing and tendency of the present age towards the Genteel which is a little puzzling—not that we think the thing unnatural or improper in itself, but we cannot well see in what way the result is to benefit society. Gaudy or ill-matched colours betray a mental struggle, which may end in advancing the individual in the path to taste; and a control, however rude, of the language and movements of the body, may in like manner result in an approach towards politeness. But of what utility in our social progress is the present chronic revolution in Proper Names? Suppose, for instance, the whole race of Smiths get on to writing their name Smyth, or even reach the *ne plus ultra* Smythe, *cui bono*? Smythe is not intrinsically better than Smith; it is only more uncommon: and every advance the multitudinous tribe makes in this direction defeats its own object. If Smythe were a good, or a beauty in itself—if it were the *beau ideal* of Smith—that would be another thing; but it does not even make the name a dissyllable—it leaves it the same short, squat, *rustrier* word as ever. Nothing, in fact, can be done for Smith but giving it an amiable prename, or, better still, a title. Sir Sidney Smith, for instance, has a decidedly aristocratic sound; and this has no dependence upon its personal associations, otherwise Adam Smith would be recognised as the legitimate chief of the clan. Without a prename at all, Count Smith and Baron Smith, so common on the continent, are highly respectable; and if a suggestion had been adopted, which was kindly and happily made, on the occasion of the marriage of an Irish beauty of the name with a scion of Italian royalty, Smith would have become one of the most distinguished patronymics in the kingdom. The match alluded to was reckoned a *mesalliance* on the part of the lover, who was accordingly threatened to be discarded by his family; and he was therefore advised to confer upon the name of his lovely bride his own title, and call himself Prince Smith.

But even a prename alone may be of great advantage. There is one of the novels of Miss Edgeworth—we forget which—in which a gentleman of the name of Harvey figures as the hero. Harvey! Only fancy John, Peter, or even William Harvey as the hero of a novel! But Miss Edgeworth was too well acquainted with the philosophy of names to commit such a blunder: she made the individual Clarence Harvey; and the name has never to this day been objected to even among the female teens. Our own attention was first attracted to the importance of names by the case of an adventurer in London whom we knew personally. He was a countryman of the Princess Smith alluded to, and had come up to push his fortune in the musical line. Being really a person of fair abilities, he obtained a few pupils, and had even a couple of little songs published by the music-sellers: but it would not do. He did not make enough to keep his family (for he had brought his wife and child with him), and when want began to stare them in the face—and pinch too, as well as stare—he at length made up his mind, though with many bitter regrets, to go back to Connaught. What could he do? Nobody cared about songs by R. A. R.—; and to this day

their merits remain an impenetrable mystery. We were in the music shop when he was closing the publishing transaction, and he had occasion to sign his name—we fear not to a receipt. The publisher stared at the document, in which the signature was given at full length, and then at him.

'R. A.!' cried he. 'Why, your name is Ralph Abercromby!'

'You may say that. Wasn't it after the general I was christened?'

'Goodness gracious! Ralph Abercromby! Why did you not mention this before? And are you really off now—with a fortune in that name?'

'Sure it's time to be off, when I have paid the fare, and forgotten the rinf? Bad luck to the name! If the initials brought us to this, wouldn't the rest of it have starved us entirely?'

'The man is an ass!' mused the publisher aloud, as our friend flung out of the shop. 'But Ralph Abercromby R——! that name would have carried him through, if he had brayed *worse* than a donkey!'

Sometimes it is considered advantageous to give one's name a foreign air; as if we were valuable exotics naturalised in the country, but still looking brown and yellow, as it were, in honour of our origin. Thus plain Miller is homely and sturdy (though not overly honest), till it is improved into Muller; but when this again becomes Mühler, it is quite a molendinary curiosity. We fancy Mr Mühler was some centuries ago Herr Mühler, and we long to ask him, When did you come over? This expression, by the way, *come over*, is very captivation. Some came over with the Saxons, some with the Normans—it matters little which: the thing is to get back one's origin till it is lost in the morning twilight of history; and the breadth of the ocean counts to our imagination like an additional space of time. A foreign miller, besides, is a more poetical personage than an English miller. In England, gentry of this profession may be thieves (as it used to be the fashion to represent them), but abroad they are banditti; and in Germany, some of the wildest scenes that followed the Thirty Years' War were enacted in a mill. Most people, in fact, have a strong objection to names that are associated with the vulgarities of a common trade. An aspiring Mason, by simply doubling the *s*, so as to make himself Masson, laughs at detection; although a Tailor has less facility of escape—and more need of it. He tries Taylor, and probably shakes his head; then the other syllable, Tailour; and if still appalled by the horrors of the name, he makes it, as a last resource, Tail-your.

But there are other associations still more frightful, as in the Scotch name Boag, which is identical, at least in sound, with that of the insect called by the English bug. The desperate efforts made here by the hereditary victims are truly alarming. Some write the word Bogue; but finding that they have thus got into the spiritual world, they rush madly into Bogue, and sometimes Boog. When a name, on the other hand, has a meaning complimentary to its possessor, the grand desideratum is, to make it as plain as possible. Thus Archibald is somewhat equivocal as it stands; and it is neatly and decisively modernised into Archbold. Frequently the only fault complained of is the want of euphony—as in Mucklewham. Somebody says, in the Waverley novels, that he could not think Venus beautiful if announced in a drawing-room as Miss Mac-Jupiter. What would he think, then, if presented for a quadrille to Miss Mucklewham? But thanks to the taste of the times, the name is nearly obsolete, and our fair partner is now Miss Meikleham.

A familiar object, even when its associations are good, is not approved of for a name. Burn (a stream) was sought to be made a little grander, by being given in the plural, Burns; but personal associations, as we have already observed, having no effect in this species of mania, some diverged into Burnes; while others, determining to sever definitively all connection with poetical

immortality, called themselves Burness. Mill, in like manner, was made Mills, and was then sunk entirely in Milne; and Home became Hume, and Hume, Hulme. John, on the same principle, is pluralised Johns, and this made into Johnes, and Jones.

But personal associations are only ineffective when modern. It is considered a great attainment to get back Cumming to its probable origin, Comyng; and those who are not satisfied with elongating Graham into Grahame, rest with delighted pride upon the Celtic Graeme. The colours, we need hardly add, are always sought to be washed out. White becomes Whyte, and is then entirely obliterated in Wight; and Brown, after passing through the intermediate Browne, relinquishes its identity in Broun.

In all these transformations the aim is the same—distinction. We wish to divorce ourselves from things common and vulgar, and fancy—oddly enough—that we in some measure accomplish this by misspelling the name we have received from our parents. We once knew an instance, and rather an instructive one, in which this nominal distinction was carried progressively on with the advance of the fortunes of the individual. His original name was Cuninghame; and he was born in a station in which people think very little, and frequently know very little, about their patronymics. He was an errand-lad and porter in a draper's shop in one of the larger towns on the west coast of Scotland, and being a smart fellow, was on some occasion promoted to a station behind the counter. This was a great advancement for the errand-lad, and he became all on a sudden prodigiously genteel. What first put it into his head, it is hard to say; but certain it is, that a little twirl at the end of his written name subsided gradually into an *e*, and at last, to all intents and purposes, he was Mr Cuninghame. In two years after this consummation, he was left very unexpectedly the sum of £200 by a distant relation; and Mr Cuninghame determined to retire from his employer's counter, and take one of his own. While looking out for a proper place for his intended establishment, a new change occurred in his name, corresponding with the expansion of his ideas in other respects; and he became now, to the great surprise of his acquaintance, Mr Coyninghame. But it so happened that, before he had quite fixed upon a site for his 'warehouse,' he was quite fixed himself in admiration of a young lady, the heiress of a tallow-chandler; and as she was much struck with his person, and the uncommon gentility of his name, he abandoned his present pursuit, and laid siege to her as the more promising speculation of the two. In the course of his courtship a new change occurred in his name, and he was now Mr Coynynghame. It is supposed that this was in homage to the taste of the heiress; and the supposition receives some colour from the fact, that after she proved faithless, he knocked out indignantly the additional *y*. It was not so easy, however, to place himself in other respects *in statu quo*. His capital was by this time nearly all gone; and after a dreadful struggle with his pride, he was compelled to step behind a counter once more as the shopman of another. With a stern philosophy, he signalled his fall by the sacrifice of the remaining *y*: but the Furies were not yet appeased. The great monetary crisis took place at this time, which reduced most of the establishments in the town, and among a multitude of others, threw Mr Cuninghame out of work. His remaining funds were quickly exhausted. What was to be done? He had the good sense to take a porter's employment again, and became once more plain John Cuninghame.

In this history we see movement without progress. The mistake was to suppose that a change of position rendered a change in the name an advantage, or that any additional dignity could be derived from spelling it with one letter instead of another. It was very proper for the porter to abandon his jacket in favour of a coat when he became the shopman; but a name is no indication of rank, any more than rank is an indication of

virtue. After all, we believe the most frequent revolutions in names have been the result of mere accident, such as the ignorance of the parties of the mystery of orthography, and the disregard in which such niceties were held before the language had attained its present fixed and regular form.

Column for Young People.

THE OAK AND THE BOW.

ON the skirts of an extensive forest there grew, in days gone by, a huge, magnificent, wide-spreading oak, whose ponderous branches, gnarled, angular, and knotty, and each the size of a respectable tree, stretched over a space of ground so large, that I am afraid to say how much, lest I should be suspected of exaggeration. From these vast branches he shot up a thousand arms, ten thousand heads, and hundreds of thousands of tiny fingers, into the changeable sky, and waved his crumpled and scolloped leaves in the balmy spring-time air, or spread them 'neath the hot summer sun—a myriad of quivering parasols for the lazy and luxurious herds who came to revel and ruminate in his quiet shadow. As you stood beside his monstrous trunk in the hot sweeter of July, and looked upwards, you might search long in vain for a single glimpse of the blue overhead: yet all was gay and beautiful, far more beautiful than I can tell you, and rich with a thousand tints of green, and red, and gold, and fluttering light: and there, in an endless suite of bowery halls, the squirrel kept joyful holiday; and tribes of feathered vagrants chirped, and sung, and made merry; and wood-doves cooed and crowed at eventide; and the woodpecker tapped and tapped half the livelong day together; and the little gray tom-tits darted up and down like mad, and said their say with the best of them; and the chaffinch played his one bar of music fifty times over, and then flew down saucily to see how the world was going on outside, but soon came back again with a worm or a grub for his private eating. It was the very place for the birds, was that famous oak; and large enough, I am sure, for a new Parliament House for all the tribes that ever flew, supposing them to be satisfied with a reasonable number of representatives.

A very different affair, I reckon, was the great oak in winter, when all his garniture of leaves was gone, and he stood naked to the stormy winds; but he didn't care, no, not an acorn, for them: he was sound in trunk, and whole in every limb; and though he had often squared his arms so boldly against the thunder-clouds, the fork lightning had never touched him yet, and he wasn't a bit afraid, not he. Then, when the snow storms came, he grasped the flying flakes with every finger, and dressed himself in a new white robe, and was prouder, if possible, of such a dainty surplice, than of his mantle of Lincoln green. Both in winter and summer he was a noble and magnificent spectacle; and everybody that passed by, or sat and rested on his gnarled and twisted roots, said as much, and turned their heads again and again as they went away to look at him in new points of view. And many came from great distances to see him, for his renown had spread through all the country round about; and artists had painted his picture, ay, many a time; and poets had written sonnets in his praise. And pic-nic parties would come on sunny days, and spread their table-cloth under his broad shadow; and then the voice of mirth, and laughter, and song rang through his green chambers all the festive hours till sundown. Then, sometimes on the short dry sward beneath his boughs, troops of village lads and lasses tripped and reeled in the riotous dance, to the music of their own merry voices, and floundered about, if the truth must be told, in a manner that would have driven a dancing-master to destruction. And often in the quiet evening, when the fiery-red sun seemed cutting a notch in the gray distant hill behind which he was fast sinking to rest, a pair of whispering lovers would come and sit beneath his darkening roof, and gaze up into the peaceful sky, till the pale stars came out to their night-watch, and twinkled through the trembling foliage, among which the night-wind sighed a dreamy tune. Nobody could tell how many years this fine great oak had stood there in his beauty and glory. The oldest man in the village two miles off could see little or no difference in him, though he had known him for more than threescore years; and declared, moreover, that his father, ay, and grandfather too, had never, in his recollection, mentioned the tree by any other name than that of

the 'great oak.' Yet old as he was, and though many generations of men had been born and buried since he was a sapling, he still stood in all his beauty, and vigour, and verdure: old, it is true, for anything else, but not old for an oak; and likely to live five hundred years yet; though it was thought by those who knew most about such things that he might have lived nearly as long already.

It is hardly to be wondered at that all the fine things which he heard said in his praise, and the general tribute of admiration and astonishment paid by everybody who saw him, made our leafy friend more than a little proud and self-sufficient. Indeed this was so much the case, that he carried his head the higher, and indulged in loftier notions every day. He saw that all the neighbouring trees were small in comparison with him; and though none of them were very near, nor ever came within reach of his shadow, except at sunrise and sunset, yet he could look clean over their heads, with a very few exceptions, and see far away into the deep forest, where, amid all the countless faces of foliage that looked upwards to the sky, there was none to rival him. So he grew proud and prouder still, and said to himself, quoting Cowper, 'I am monarch of all I survey'—there is nothing here that can match me—a single limb of mine is worth any entire tree of the lot—I am the king of the forest—a right royal monarch of the woods.

Now there was a poor old sow, belonging to an aged woodcutter in the forest, who spent her whole days in grubbing about among the trees and bushes in search of food, and made but a sorry living with all her pains. She had seen in her time, she was wont to say, a deal of the world, but little luck; and, to judge by her appearance, she spoke the truth. She was lean, and lanky, and long-legged, and bare of bristles, and bony to sight; a state of things, as everybody knows, not at all creditable to a pig. Unlike the oak, she had not a single admirer in the world. Everybody said, 'What an ugly beast!' and turned away in disgust; and, still unlike the oak, she had not a jot of pride or conceit, but practised a quiet resignation to her lot. Like honest Dogberry, she had had losses, having brought up in her time near twenty litters, who had all succumbed to the butcher's knife—some, massacred unweaned innocents, fated to figure on the festive board as roast sucking-pig; others, with prolonged doom, promoted to play the part of country pork; but all as clean gone from her side as Macduff's children—not a bristle left; and she, their dam, hungry and old, left to wander in her solitary age, with the mortifying reflection, that if she had saved her bacon hitherto, it could be but from the sheer circumstance that it was worth no man's griddling.

It came to pass on a quiet gray morning, in the latter end of October, when the whole forest was fast changing its green into numberless tints of yellow, and red, and brown, that the great oak, which was always in a melancholy mood at this time of the year—perhaps not much relishing the gradual loss of his summer dress—saw the old sow come bustling out of the wood, with snuffling snout set towards him, true as the needle to the pole. He knew, by former experience, well enough what she was after. There had been a high wind in the night, which had shorn him of whole cart-loads of leaves, and he was still shedding his acorns, would he, n'ould he, 'fast as the Arabian trees their medicinal gum.' 'Oh,' said he, 'here comes that abominable beast again, that has devoured my offspring for the last ten years. I wish my acorns were poison rather than pigs'-meat, that I might be rid of that ugly wretch, which eats all my produce, and never has the gratitude to say "thank ye." The sow came on, meanwhile, with a show of alacrity quite creditable to her years, caring nothing at all for the scorn of the tree—never dreaming of it, in fact; and soon began grubbing and snorting among the fallen leaves, and crunching the acorns by the score, with a gusto and vigour that had evidently lost nothing by want of practice. 'Ah, the filthy brute!' said the oak to himself. 'It is strange to me that man should be so silly as to suffer an abominable beast like that to swallow a whole navy for a breakfast, and convert a future forest into bacon, and such bacon too—laugh!' Still he said nothing aloud: he scorned to speak to the object of his wrath and dislike; he would not demean himself by showing his displeasure, but nourish his contempt in silence. The sow the meanwhile pursued her operations with perfect pleasure and satisfaction: among the rugged roots that protruded above the soil she grouted and grubbed, and brought up the shining 'cups and saucers,' and ground

them to pulp in no time: round about in all directions, beneath the ample roof, she raked and scratched, and flung the withered leaves, and caught the shining berries, and ate, and ate, and ate, till that consummation was at length accomplished which had not been accomplished for a twelvemonth before—she was satisfied, and was no longer hungry. Then she turned to go back to her lair in the forest, intending to sleep out the rest of the day. But the oak—whose exasperation had increased with every mouthful, and which had watched the whole repast with the feelings of a true timber Niobe, till wood and sap could stand it no longer—in a paroxysm of rage, called upon her to stop.

'Graceless swine,' said the angry tree, 'is that the way you return thanks to your benefactors? Year after year do you come with your ugly carcase, and gorge my finest fruit, and not a single grunt of gratitude do I ever hear from your unmannerly snout. You might at least say "thank ye" for the many full meals you have made at my expense.' But the old sow, who was no fool, and, for aught that I know to the contrary, might have been akin to the sapient Toby, was not disposed to be browbeaten by the tree, and so she answered him thus:—'You are doubtless a great personage, and think very little of me, and such as I am; and, like other great personages I have heard of, you seem disposed to claim respect and gratitude from those who owe you neither. I have been half-starving all the summer, which you know full well, and which my present condition plainly shows; yet though you were loaded with young and tender fruit, not an acorn have you contributed to my necessities, and I might have perished for want ere you would have thought of relieving it. Yet now that the elements deprive you of what your selfishness can no longer retain, you demand my gratitude for benefits which you would withhold if you could. None but a wooden head would have dreamt of making such a demand, and a wooden head will I wear before I think of complying with it.'

The reader need not puzzle himself much for the application of this fable. The moral is involved in the sow's reply. Gratitude is only due when a benefaction is willingly bestowed. He who gives away only that which he cannot keep, whatever he may be, is no benefactor; and he who surrenders to another what is of no value to himself, comes but little nearer the mark. Concession is the soul and spirit of benevolence—abnegation, of love; and if charity be a brilliant star, self-denial is its nucleus and centre.

THE CURRENCY.

In reference to a quotation made in the Journal of June 6th, from the 'Westminster Review,' to the effect that the withdrawal of a certain sum from the circulation ought not to interfere with prices, or disturb trade, since large accounts are settled without any cash passing at all, a London correspondent makes the following remarks:—'In order to show the error of the reviewer, suppose I keep an account at the Bank of England, and that I owe Mr Brown £1,000, who likewise banks there. I pay him with a cheque, and this, on being presented, is charged to my account, and placed to the credit of Mr Brown: a debt of a thousand pounds being thus paid and received by means of a few strokes of the pen, and without the passing of a single farthing. This transaction would seem to confirm the reviewer's theory; but what would become of it if I had not £1,000 in the bank? The case is the same with all accounts that are settled by means of books and figures. The money is somewhere, though it is not handed about; and therefore the disturbance of the currency, by adding or withdrawing millions of pounds to or from the circulation, does produce the mischief so much felt in the commercial world, and the reviewer has only added another error to the thousand and one that already existed on this important question.'

CULTIVATION OF CONSCIENCE.

As we cultivate taste, or our susceptibility to beauty, by meditating upon the most finished specimens of art, or the most lovely scenery in nature, so conscience, or our moral susceptibility, is improved by meditating upon anything eminent for moral goodness. It is hence that example produces so powerful a moral effect; and hence that one single act of heroic virtue, as that of Howard, or of illustrious self-denial, gives a new impulse to the moral character of an age. Men cannot reflect upon such actions with-

out the production of a change in their moral susceptibility. On the contrary, the discriminating power of conscience may be injured by frequent meditation upon vicious character and action. By frequently contemplating vice, our passions become excited, and our moral disgust diminishes. Thus, also, by becoming familiar with wicked men, we learn to associate whatever they may possess of intellectual or social interest with their moral character; and hence our abhorrence of vice is lessened. Thus men who are accustomed to view, habitually, any vicious custom, cease to have their moral feelings excited by beholding it. All this is manifest from the facts made known in the progress of every moral reformation. Of so delicate a texture has God made our moral nature, and so easily is it either improved or impaired. Pope says truly,

Vice is a monster of so frightful mien,
As, to be dreaded, needs but to be seen;
But seen too oft, familiar with her face,
We first endure, then pity, then embrace.

It is almost unnecessary to remark, that this fact will enable us to estimate the value of much of our reading, and of much of our society. Whatever fills the memory with scenes of vice, or stimulates the imagination to conceptions of impurity, vulgarity, profanity, or thoughtlessness, must, by the whole of this effect, render us vicious. As a man of literary sensibility will avoid a badly-written book, for fear of injuring his taste, by how much more should we dread the communion with anything wrong, lest it should contaminate our imagination, and thus injure our moral sense!—*Wayland's Moral Science.*

PORRIDGE.

Oatmeal is likewise used, and deserves to be much more used than it is, in the form of what is called stirabout or porridge. This is made by gradually stirring oatmeal into boiling water, until enough has been added to give the required degree of consistence—continuing the boiling until the meal is sufficiently cooked. It is commonly eaten either with milk or with butter-milk. This is usually a very unirritating kind of food—an article of diet which is well adapted to the case of children, and little less so to that of dyspeptics; and for the labouring population it forms a breakfast that is much more nourishing and wholesome than the tea and the bread and butter, or bread and dripping, which are in England so much more generally made use of. Flour bread and milk, although certainly well suited to the stomachs of most children, is nevertheless found to disagree with some; and as a general breakfast for children, I think that oatmeal porridge and milk deserves to be preferred. It is an unstimulating diet; it is very easily digested; it contains a very considerable proportion of nutriment; and it seems usually to act slightly on the alvine excretions—while in many cases a continued use of milk renders it necessary to take an occasional dose of aperient medicine.—*Dr Robertson on Diet and Regimen.*

IMITATIVE POWER IN BIRDS.

So strong is the imitative power of birds, that a canary who has been taught to pipe, having heard a chaffinch that daily sung in a tree near the window where the cage was hung, learnt his note in a few days, omitting at that time the air he had been accustomed to sing. At the end of the spring, after having been removed from the neighbourhood of the chaffinch, he resumed the air as before. A nestling nightingale also learnt the notes of a hedge-sparrow that sung near it, for want of other sounds to imitate; and it was extraordinary to hear the gentle, although agreeable warble of the latter, attuned to the full compass and power of the nightingale. The effect was most pleasing, although of course not equal to the natural notes of this bird, not one of which he retained. Indeed many birds are almost, if not entirely, imitative, and, in default of hearing the parent bird, borrow notes of others: soft-billed birds always prefer the song of soft-billed birds, and *vice versa*. It is hoped, from what has been said on the above subject, that persons who are in the habit of keeping caged birds will be induced to educate them in the manner suggested. Then, instead of hearing the shrill, denfening natural notes of the canary, they will be delighted with those of the nightingale, the blackcap, and other warblers. 'They will then breathe such sweet music out of their little instrumental throats, that it may make mankind think that miracles are not ceased.' So said the good Izaak Walton.—*Jesse's Favourite Hounds.*

A L O N E.

'Twas midnight, and he sat alone—
The husband of the dead.
That day the dark dust had been thrown
Upon her buried head.
Her orphaned children round him slept,
But in their sleep would moan :
Then fell the first tear he had wept—
He felt he was alone.

The world was full of life and light,
But, ah ! no more for him !
His little world once warm and bright—
It now was cold and dim.
Where was her sweet and kindly face ?
Where was her cordial tone ?
He gazed around his dwelling-place,
And felt he was alone.

The wifely love—maternal care—
The self-denying zeal—
The smile of hope that chased despair,
And promised future weal :
The clean bright hearth—nice table spread—
The charm o'er all things thrown—
The sweetness in whate'er she said—
All gone—he was alone !

He looked into his cold, wild heart,
All sad and unregined :
He asked how he had done *his* part
To one so true, so kind ?
Each error past he tried to track—
In torture would atone—
Would give his life to bring hers back—
In vain—he was alone.

He slept at last ; but when he dreamed
(Perchance her spirit woke),
A soft light o'er her pillow gleamed,
A voice in music spoke—
'Forgot—forgiven all neglect—
Thy love recalled alone ;
The babes I leave ; oh, love, protect !
I still am all thine own.'

—*American paper.*

THE SCENERY OF ENGLAND.

I soon began to weary of an infinity of green enclosures, that lay spread out in undistinguishable sameness, like a net, on the flat surface of the landscape, and to long for the wild free moors and bold natural features of my own poor country. One likes to know the place of one's birth by other than artificial marks—by some hoary mountain, severe, yet kindly, in its aspect, that one has learned to love as a friend—by some long withdrawing arm of the sea, sublimely guarded, where it opens to the ocean, by its magnificent portals of rock—by some wild range of precipitous coast, that rears high its ivy-bound pinnacles, and where the green wave ever rises and falls along dim resounding caverns—by some lonely glen, with its old pine forests hanging dark on the slopes, and its deep brown river roaring over linn and shallow, in its headlong course to the sea. Who could fight for a country without features, that one would scarce be sure of finding out on one's return from the battle, without the assistance of the mile-stones?—*Miller's First Impressions of England.*

TRUTH.

Truth, considered abstractedly, is the object of universal admiration; and all men would fain persuade themselves that, in the investigations they pursue, they are mainly anxious to discover her features, and to award her the supremacy which is her due. But so much does human frailty interfere with the best-directed efforts, so much do private feeling and unconscious prejudice alloy the purest suggestions of the heart, that if we were to scrutinise our wishes rigidly, we should often be constrained to admit that we are more desirous to exact homage for an idol of our own creation, invested by our partiality with every possible attraction, than calmly bent on surrendering our undivided and willing allegiance to the true divinity whose name and praise is ever on our lips.—*Amos.*

THE SCIENTIFIC FESTIVAL AT OXFORD.

THE British Association for the Advancement of Science held its meeting this year, in unusually favourable and agreeable circumstances, at Oxford. There was an attendance of about twelve hundred, which is much above the average; and amongst the number were a greater proportion of distinguished foreigners than had been present on any former occasion. The delicious summer weather, and the beauty of the place, combined, with the usual holiday features of the scene, to render it an affair such as few have many opportunities of enjoying in the course of a lifetime.

We arrived late on Wednesday evening (June 23d), by which time the first general meeting had taken place, and the year's president, Sir Robert Inglis, had been inducted to the chair, and had delivered the proper address on the progress of science during the past year. Early on Thursday—the first day of the meetings of sections—we made our way to the Reception Room at the Town Hall, to ascertain the procedure of the day, and learn any other particulars that might be requisite. Already there were many strangers abroad on the same errand—single figures and little groups moving hurriedly along the pavement. Every now and then one stopped to greet another in that pleasantly-excited state which attends festival occasions. Many of the acquaintanceships thus acknowledged are, we may remark, sustained solely by the Association meetings. The men meet on these occasions—retire again for a year to their respective homes—and a twelvemonth after, meet again, and are happy so to meet. Not a few thus come to like each other, and have a sympathy in each other's pursuits, who, were they never to have a personal rencontre, would probably remain as antagonistic principles, widely apart, all their days.

It soon appeared that the sections were to be handsomely and amply accommodated in the public halls and schools of the university, while a large proportion of the members were received into the colleges as honorary lodgers. So far well; but it was less pleasant to find that, for the less favoured, both lodging and food were only attainable at about twice the usual prices. This is perhaps an evil not altogether superable; and yet it is one worthy of some struggle, as it must bear hard on the means of many worthy votaries of science, and deter them from reappearing at the meetings. It is not for nothing that there is a somewhat unusual amount of hat-touching to be observed in Oxford.

The Section (A) for Physical and Mathematical Science was placed, with one or two others of less note, in what are called the Taylor Buildings—a superb structure, singular in Oxford, from its being quite new, and where there is a fine collection of works of art, particularly the Lawrence collection of the original draw-

ings and sketches of Michael Angelo and Raphael. Here sat the rigorous men of the exact sciences—Brewster, Lubbock, Baden Powell, Lord Rosse, the Dean of Ely, &c.—deeply cogitating on astronomical observations, the measurements of arcs of the meridian, the application of the calculus of quaternions to the theory of the moon, and other such pleasantries. In point of *personnel* there was no section more interesting than this; for here, besides a group of the most eminent philosophers of our own country, were assembled some of the most distinguished foreign savans. We had there, for instance, Professor Struve, the Russian astronomer, one of those who were first to ascertain a parallax for any of the fixed stars. We also had M. Leverrier, the discoverer of the new planet Neptune—an amiable-looking fair-complexioned man of perhaps three-and-thirty, who usually expressed himself in French, but always with remarkable elegance, as well as modesty. The kindly way in which Leverrier associated with Mr Adams, whom only unfortunate circumstances forbade to have the entire honour of this discovery, elicited general admiration.

The Geological Section met in the Convocation House, one of a congeries of ancient and beautiful rooms in the central part of the city. This is always a peculiar section—peculiar on account of the chief figures being a set well known to each other, men who have rubbed long together in one favourite pursuit, and thus become unusually intimate and familiar. Go when you please into the geological section, and you are fully as likely to find them all laughing at some joke of Dr Buckland's, or some quaint display of Professor Sedgwick, as listening patiently to any instructive demonstration. It is eminently the funny section. One exceedingly curious trait of it is, that its president is continually struggling to keep discussion within bounds; and yet, when he rises to give his own opinion, he is sure to kill as much time as all the rest put together. He is always holding his watch up to other people, and he would himself need the great Tom to be his monitor. It is a section which is always panting to overtake its business, and never comes up to it. Should the fun be omitted? That would save time; but then what would the section be without its quips and its quiddities? No, it must laugh on to the end, even though there should be the less work done.

The other sections are of very various character, but none prominent. There is a Chemical one, graced by Faraday, Grove, Playfair, and others, and zealously attended by its own peculiar set, but little regarded by the general mass. There is also a Natural History Section, which keeps going at a quiet steady pace, never very brilliant, and never very dull; something, perhaps, between the two. A conspicuous figure here was the Prince of Canino, eldest son of Napoleon's cleverest

brother; a short dense man of dark complexion and large square head, about forty-eight years of age; always intrenched behind a book-heaped table, whence he launched pertinacious queries and cross-examinations regarding the spots on the dorsal fins of fishes, and the number of feathers in the wings of birds. How strange to think that such is now the pleasingly-absorbing employment of one who at one time had no small chance of becoming the greatest sovereign in Europe! Another was Dr Milne Edwards of Paris, a keen-eyed little man, of immense knowledge, and great skill in demonstration. A third was the Prussian Ehrenberg, the discoverer of fossil animalcules in rocks—a plain-looking, little, short-necked man, with a fine towering head. Here, too, occasionally appeared Professor Nilsson of Lund in Sweden, an eminent naturalist, of grauwacke aspect, bringing skulls of the pristine inhabitants of Scandinavia, and full of curious facts illustrating the see-saw which that venerable peninsula has for some time been performing, the north against the south. Besides these were our own Owen, the prince of modern physiologists, and who has contrived to become so without incurring the least envy in any quarter; Professor Edward Forbes, so remarkable for his researches among the lower marine animals; Henslow, Strickland, Carpenter, Waterhouse, and many other men only rising into the like distinction. There was here one day a thorough turn-up of the subject of the Dodo—one strikingly well suited for scientific disquisition, in as far as extremely little is known about it; hence of course the greater room for conjecture. Oxford chances to possess a head and foot of this extinct bird—all that remains of it. It was therefore a proper field for the discussion. We heard these relics lectured on for one whole evening, and debated for the better part of a forenoon; and after all, it would have been impossible for any one to say whether the creature had been of the hawk or the pigeon tribe.

The Statistical Section met in one of the schools, and seldom had an audience of less than six to deliberate on its knotty questions. One paper of a valuable character was read here by Mr Porter of the Treasury, showing how rare is a good education among criminals, and how exceedingly few educated women ever become amenable to the laws. Another showed curious relations of proportion between the savings' banks and schools, and the moral conditions of the people of various districts. It seemed to have been prepared with immense labour. The Ethnographic was universally acknowledged to have risen in importance on this occasion. There were some excellent papers by Mr Crawford, General Briggs, the Chevalier Bunsen, and others.

The meeting has not, we believe, been considered as remarkable for the matters brought forward; but it was eminently successful as a bringing together of the chief men in the various departments, and in exciting local attention. The university men entered heartily into the business, and were most liberal in the hospitality of their beautiful old halls. The visit of Prince Albert was a remarkable event—not as an honour paid by rank to science, but an honour which rank paid to itself by a deference to science. He came in very unassumingly, with the Duke of Saxe Weimar; and after a welcome from the president, took his seat on the platform, to listen for a while to whatever was going on. In the Geological, it chanced that Count Rozen was describing a set of maps of Sweden prepared by its crown-prince, descriptive of, first, the comparative elevation of districts above the sea; second, the degree in which

the country is wooded; third, the comparative density of population; fourth, the mines of the country, and lines of road connecting these with the forts. It was interesting to hear of a king's son, and the heir of a crown, devoting himself to a labour of so useful and enlightened a kind. In the Ethnological Section, the two princes were fortunate in hearing a paper by the Chevalier Bunsen; and in Section A they were present while Leverrier and Adams were discussing the particulars of the new planet. A lunch in Exeter College completed their visit. It is said, by those who have the means of knowing, that Prince Albert is a real lover of science, and keeps up a tolerably regular correspondence on various departments of it with his old preceptor, M. Quetelet of Brussels. His visit to Oxford seems a happy expression of this praiseworthy taste. How much it were to be wished that courts were more open to the visits of the learned and the ingenious than they usually are! What a novel lustre would shine round the diadem which became a centre for such lights, instead of merely attracting the *sphynxide* and *papilionide* of the fashionable world!

Saturday was devoted by most of the members to excursions into the neighbourhood. Many went to Blenheim, to see the house which a nation's gratitude had conferred on Marlborough, with its many rich works of art since added. All came back full of indignation at the insolence of menials, who would hardly allow them to pass without repeated payments of bucksheesh—alleging, with the greatest effrontery, that it was all they had to depend upon, and that they would have to share the proceeds with their employer! Another set went out in all sorts of gigs, cars, and flies, to Shotover Hill, to hear an off-hand lecture on the geology of the district from the indefatigable dean of Westminster. A story ran, that the rustics stared a good deal at the unexpected apparition of so many strangers, and evidently formed a conclusion of their own as to the matter, for one was by and by heard saying to another, 'Well, Bill, if I think there's going to be any fighting after all!' We joined the rational section of this day in a visit to the Swindon station of the Great Western Railway, where the company have a vast set of works hardly dreamt of by the community. Here, truly, is one of the things to impress the England of the nineteenth century upon our minds. In a range of huge buildings and sheds, no fewer than eleven hundred and sixty men are at work for the production and repair of the mechanism of the railway. In one place the larger pieces of locomotive engines are making; in another the mere bolts, screws, and other minutiae—there, no less than forty lathe-frames are ranged along the floor. In another place we see the pieces of an engine in the course of being put together. A fourth shed, of acre extent, is an infirmary for damaged engines and carriages. In one of these places we were shown a movable crane for lifting the carriages; it was calculated to sustain the weight of thirty tons. In another we inspected a contrivance arranged by the engineer for ascertaining and equalising the strain on the various parts of a locomotive. It was wonderful to consider what a vast concern a railway of only a hundred and forty miles might become. It has literally given rise to a new town at Swindon, one of course all spick-and-span new—cottages of approved construction, a church and school after the best models, mechanics' institution, reading-room, everything that speaks of progress. We looked into several of the

houses, and found that, for three-and-sixpence a-week, there was a room below, a room above, a closet, and a yard with appurtenances. They were not faultless residences, but they were generally much superior to any of the old kinds of houses for the working-classes. There was an air of content very generally spread through the town, and we were told that good health prevailed. The reading-room was a comfortable place, well supplied with newspapers and literary periodicals; also possessing some philosophical instruments and objects of natural history. It was pleasant to see a concert announced as to take place in it on an early evening, and to learn that a band, playing in a neighbouring field in our honour, was composed of the working-men. There was but one thing to be dissatisfied with—the school. This establishment, being under the care of the National School Society, was furnished only with a few books of a religious tendency, leading on to the Bible. Nothing that speaks of the external world, nothing that can evoke or train the intellectual faculties, has a place here. The Swindon school is constructed on the principle of the Patent Safety Drag, and Locomotion, the genius of the place, has no part in it.

On Sunday, the great object of attraction was a sermon preached in St Mary's Church (the university church) by the Bishop of Oxford (Samuel Wilberforce). Some piquancy was lent to the occasion by a curious accident—namely, that, by virtue of a foundation for the purpose, it must needs be a sermon on humility in the pursuit of knowledge. Before the learned prelate ascended the pulpit, pews and passages were filled with a brilliant audience. Dr Wilberforce is comparatively young for a bishop, a man of amiable and gracious aspect, with a fine clear voice: a certain element of masculinity is wanting in the visage, yet, on the whole, he is a good-looking man. He touched on all kinds of humility, real and affected, and by and by came to consider what was called for on the part of those who devote themselves to the pursuit of knowledge. Being a lover of science himself, it was not to be expected that he should bear hard against it, more especially on an occasion when so many of its votaries were present. Yet neither was it to be expected that he should yield entirely to its demand to be let alone. The matter was exceedingly well adjusted by a condemnation of all rashness in speculation, all impatience for arriving at general conclusions, and by a strong recommendation—in which all there must have assented—to keep, while studying nature, her Author ever in view. In literature and in delivery this discourse was very masterly; from beginning to end, not one word, or look, or gesture amiss. But the impression left on the mind was, upon the whole, of a discouraging nature. Once more the drag.

During the two remaining days of active business, the affairs of the Association went on with unrelaxing vigour—plenty of papers, plenty of audience, no slackening in the excitement. There were several lectures on popular subjects in the Radcliffe Library, only one of which—by Faraday—was at all telling; also a *soirée* in the same place. On the Monday night, it being full moon, and the weather of heavenly clearness, we ascended to the leads of the building, and beheld a sight never to be forgotten—Oxford by moonlight! Towers, shooting silently up into the blue sky, and silvered with the lunar rays, met the eye in every direction, relieving the dark square masses of the colleges, which were half seen in shade below. We had never beheld any actual scene which appeared more completely to justify those pictures of Grenada, Constantinople, and other romantic cities which painters present to us, and the truthfulness of which we always suspect till we see the actual places.

At the proper period, this peaceful convention of the best lovers and promoters of peace separated, each glad to have been there, and anxious to be present again. May all that is good ever attend the footsteps of the votaries of science, especially all those who love science

without any tincture of love for themselves, and who can bear with the truth, even when it challenges their own prejudices, or threatens to subtract a little from their own misgained honours!

THE STORY OF ELISABETTA SIRANI.

'ELISABETTA mia, I have lost pencils—colours; come, child, and aid me to look for them. What! thou art idling away all the day in that corner, instead of taking care of thy little sisters. Hark! there is Barbara crying; and *la rambino* Anna too; and the pencils are lost; and Il Signor Montenegro is waiting for the picture. I shall never finish it.'

The speaker—Giovanni Andrea Sirani, one of the second-rate artists of Bologna—hurriedly tossed about brushes, palette, and oils, making the studio all confusion, and loudly calling on Elisabetta for assistance. She came forward from the sunny nook in the window, where she had been hidden, and addressing her angry father in a voice remarkable for its soothing and sweet tones, put into his hands the pencils he required, arranged his palette, and stood behind him while he again continued his work.

Elisabetta was a girl of about twelve years, tall and well-formed, though still childlike in proportions, and too angular to be graceful. But her face was so striking, that it would not be passed unnoticed even by a stranger. It was not that its beauty attracted the eye, for the features were not regular; and the long and rather aquiline nose would have given a character too masculine to the countenance of the girl, had it not been for the exquisitely sweet expression of the mouth, and the dimpled chin. Again, too, the harshness given by the strongly-marked eyebrows was softened by the dreamy languor of the dark eyes and drooping eyelids. In short, the whole face of Elisabetta Sirani showed a combination of masculine powers and womanly sweetness, united with that flexibility of features and ever-changing expression which almost always denotes great sensitiveness of mind.

Signor Andrea, relieved from his disquietudes, worked at his picture, now and then calling on his young daughter to inspect his progress, and listening to her remarks and comments, which, though given with the simplicity and timidity of a child, showed an understanding which justified the consideration with which she was treated by her father. Sometimes the hasty and nervous temperament of the artist was excited to anger by the noise of the children within, and he would hurriedly dismiss his eldest daughter to restore quiet, and as quickly call for her again, declaring he could not paint unless she was beside him, to grind his colours and prepare his pencils; he did not add, to give him various unsuspected, but most successful, hints even in the picture itself.

After an hour or two spent in this manner, the tête-à-tête of the artist and his daughter was broken by the entrance of a man in a clerical dress, but attired with all the taste and sumptuousness which was prevalent in the leading cities of Italy, and especially Bologna, at the close of the seventeenth century. Andrea Sirani received his visitor with mingled cordiality and respect.

'I am glad the Signor Conte Malvasia is come: I should not have been satisfied to send my picture away without his opinion on its merits.'

'You are very obliging, Signor Sirani,' said the ecclesiastic; 'but I have usually only one opinion regarding your beautiful pictures, and this is equal to any.' He sat down on the painting-chair which Elisabetta had placed for him opposite the picture; and after patting her cheek with a friendly and affectionate expression, which dyed it with a blush of pleasure, he turned his whole attention to the work before him.

'I see you love the soft and melting shadows and lucid lights of our Guido, the pride of Bologna,' said Conte Malvasia. 'And you do not work in the gloom, which some of our stern foreign brethren delight in:

you let the sun visit your painting-room, save for this warm crimson curtain, which must cast such a pleasant glow on everything here, but rather darkens the picture now.' He drew back the heavy folds, and discovered the little nook where Elisabetta had sat. It was strewn with pencils and sketches of all kinds: Malvasia picked up one of the scattered papers.

'Is this beautiful Madonna one of your studies, friend Andrea? Why, your first sketches are absolutely as good as your freshest paintings.'

The artist looked at it, and turned away with a discontented air. 'Oh, monsignor, it is only one of the child's drawings. Elisabetta, I think you might be better employed than this. Go to your mother, child.'

'Stay one moment, Elisabetta,' said Conte Malvasia, drawing towards him the reluctant, blushing, and almost tearful child. 'Did you really draw and design this?'

'Yes, monsignor,' said Elisabetta.

'Signor Andrea,' continued the conte, 'why do you not teach your daughter to be a painter like yourself? Would you not like to be a great artist, *figlia mia*?' added he.

Elisabetta did not speak, but her eyes lighted up, and her lips quivered with emotion. Andrea said roughly, 'No woman could ever be a painter.'

'How can you say so, Andrea? Have you forgotten Lavinia Fontana, and Autonia Pinelli, and our own Properia?'

'Do not bring Madame de Rossi forward as a model for my child. Besides, Elisabetta does not wish to be a painter.'

Elisabetta went timidly up to her father, and laid her hands, still folded in intreaty, on his arm. 'Dear father, I do wish it; I long for it. Listen to it, Signor Conte: teach me to paint like you.'

The painter, jealous as he seemed of his art, was moved, and from that time he suffered his daughter to pursue her studies openly, though the aid and instruction which she received from him were very little. Andrea Sirani seemed displeased that a young girl should know almost intuitively what it had taken him long years to acquire. He did not see the difference between natural genius and talents which were almost entirely the result of cultivation. Yet Elisabetta did not trust to her genius alone, a light which has led astray many a young aspirant; nor did she think that her surprising powers rendered supererogatory the patient study which is necessary in every intellectual pursuit—most of all in art, where the tact and judgment of a philosopher, the learning of a man well-versed in literature, the eye and heart of a poet, and the magic hand of a painter, are all required by him who would attain to eminence.

Elisabetta Sirani—and we are not describing an ideal character, but one who really lived, and breathed, and worked, whose name is still honoured among the Bolognese school—Elisabetta Sirani, as her childhood passed away, devoted herself more and more to her beloved art. She perceived that her father felt an ill-concealed aversion to seeing her at her easel, and, besides, he had been so accustomed to her assistance in the minor duties of the studio, that he could not bear to see her painting on her own account, instead of attending upon him. Therefore she rose by the dawn of day, and painted and studied with unwearying perseverance, until the hour when Andrea required her presence in the studio. Then she patiently relinquished the occupation which she loved so well, and turned her attention to her father, to the domestic concerns of the house, or to the acquirement of music, a study which was her greatest delight next to the one in which her genius lay. To the world she was still the simple Elisabetta, daughter of the painter Sirani, distinguished by no outward signs from her young sisters Barbara and Anna, or from her companions among the Bolognese maidens. No one knew in what her hidden talents were, save her father—who shut his eyes upon them as much as possible—and her unswerving friend, the Conte Malvasia.

At last, when Elisabetta had reached her sixteenth

year, there came a change. A slow and painful disease stole over the unfortunate Andrea Sirani, crippling all his joints, so that day by day the exercise of his art grew more difficult, until at length it became almost impossible for him to wield the pencil. In vain did Elisabetta chafe the poor numbed hands with her soft fingers: they would work no more; and life itself seemed torn from the despairing artist, thus deprived of the power to embody his conceptions.

'It is all in vain, Elisabetta,' cried Sirani one day when the brush had fallen from his crippled fingers, which could no longer guide it—it is all in vain; I shall never paint more.'

He looked at his powerless and disfigured hands, and tears rolled down the cheeks of the strong man. No wonder that the gentle Elisabetta wept too, and threw her arms around her father's neck, in vain attempts at consolation.

'Do not give me hope, my child,' he answered mournfully; 'I know it is incurable. I am no more an artist. Holy mother of mercy! how shall I find bread for my children?'

Elisabetta's cheek flushed, her eyes sparkled, words rose to her lips; but she stopped, thinking of the pain they would give to her helpless father. At last she said timidly, 'Father, you know I have been your pupil these four years; in that time, I think—I hope—I have learned enough to gain something by my paintings. Will you let me try?'

Andrea shook his head. 'Impossible: a girl not seventeen, and I have been a painter these twenty years. But it is long since I have seen thy work, child,' he added in some confusion; 'bring it hither.'

Elisabetta, deeply joyful that her woman's tact had thus effected what she thought would be a discovery both difficult and painful, quickly placed before her father a Madonna, so beautiful, so full of genius, that the artist at once saw the concealed powers of his child. It was in vain to nourish jealousy; for, alas! there could be no rivalry between them now. He kissed Elisabetta's brow, and prayed the Virgin, whose sweet face she had depicted so well, to bless his good and talented child.

Elisabetta became a painter. When only seventeen, her first exhibited picture made her the wonder and pride of her native city. It was a religious subject, such as the gentle and pious girl loved delineating—the saints of her church, St Ignatius and St Francis Xavier. The purchaser was the Marchese Spada; and the sum Elisabetta thus gained was large enough to bring a thrill of proud delight to her heart, with the consciousness that the future was her own. Her little sisters laughed and shouted at the sight of the purse of gold; her young companion, Ginevra Cantofoli, whispered in her ear how many personal adornments of silks and jewels it would purchase; but Elisabetta went straight to her father's chamber, and laid the first fruits of her talents and industry on the bed where the suffering artist was now confined.

'My father,' she said in meek and blushing humility, 'we have gained thus much by my picture: see!'

'Thou sayest we, Elisabetta,' answered Sirani. 'Why not I? This money is all thine.'

'Not so, dear father,' said the young girl: 'all I have learned in painting I owe to thee. I am only thy hand to work in thy stead, until it shall please the blessed Madonna to restore thee. Therefore this shall be devoted, like all thy other earnings, good and kind father, to the general benefit of the family.'

Two large tears stole through the closed eyes of the poor artist; but he said nothing. Perhaps Elisabetta's loving deceit, aided by the natural vanity of mankind, made him actually believe that his daughter's ~~useless~~ gifts were but a due requital for his instruction in art. But he made no opposition, and her future earnings were all appropriated to the domestic wants of the family. Night and day did the young Bolognese sit at her easel. Yet it was a labour of love; for she had

that earnest devotion and enthusiasm for art which constitutes the true riches of genius, and its reward, entirely independent of worldly success. But this latter did not fail Elisabetta. A woman, young and fair even among the beautiful of Italy, she attracted the attention of the connoisseurs of her native city, who saw with surprise a young maiden of eighteen execute with facility works equal to many of the most renowned artists of the day. Her quickness of hand was extraordinary; her slight fingers seemed merely to play with the pencil, and the painting grew under them almost by magic. The number of pictures which yearly came from her easel was astonishing even now; but Elisabetta had that strongest spur of all to diligence—she was working for the daily bread of those most dear to her, and who could only trust to her for support.

Looking back through the lapse of centuries on the life of this young and gifted creature, one marvels first at the wonderful steadiness of purpose which supported her at the commencement of her arduous career; and then at the sweet womanly nature which made her still humble, unsophisticated, and undazzled by the success with which that career was crowned. The noble and talented of the land crowded to her studio; churches far and wide were adorned with her pictures; kings and queens sent her letters of compliment on her works; and yet the young artist, in her own quiet home, was ever the same simple Elisabetta—tending her decrepit father, who was sometimes for whole months confined to his bed, aiding her mother in all domestic cares and occupations, instructing her sisters, and brightening the whole house with her cheerful and blithe spirit.

According to the usual custom of the Italian painters, Andrea Sirani had formed a school of young artists, who profited by his instructions, and followed his style. Among these was the favourite companion of Elisabetta, Ginevra Cantofoli. From earliest girlhood there had been a friendly rivalry between the two—at first amicable; and then, as Elisabetta's success increased, becoming gradually more serious, though it was not apparent. Every new triumph of the daughter of Sirani gave a pang to the heart of Ginevra, until at last the wild passions of the south were all roused in her bosom, and a jealous rivalry took the place of her old love for her childish friend. Every sweet and kindly word of Elisabetta's but embittered this feeling, which became the stronger for concealment. When, in the sincerity of her friendship, Elisabetta praised and encouraged her young rival, and at times assisted Ginevra in her pictures by the touches of her own superior hand, no feeling save of envy and dislike entered the heart of the proud and desperate Italian. Even her beauty—and Ginevra was very beautiful—she counted as nothing compared with that of Elisabetta.

But all unconscious of this, the artist's daughter went on her way—her loving and quiet spirit untroubled by any of those violent passions which distracted Ginevra—pursuing her art with unwearied diligence. She rarely joined in the amusements of the ladies of Bologna; her sole recreation was her favourite science of music. Often in the delicious Italian evenings Elisabetta would take her harp, the instrument in which she excelled, and for hours together draw from it the sweetest sounds, giving up her whole soul to the passion for music and to love of art—talents not unfrequently combined.

One night she was thus occupied, when Conte Malvasia entered unobserved. He went up to the couch where Andrea Sirani, whose sufferings were a little abated, lay watching the sunset, and occasionally turning his eyes to where Elisabetta sat, bending over her harp. Her form had lost its angularity in the roundness of womanhood; her dark hair was knotted behind in thick plaits, after the fashion of the times, save that a few silken curls rested on her white throat, which the stiff and tight-fitting dress of the day could scarcely hide. The expression of her eyes and mouth was as sweet as ever, and as she sang, her whole face was lighted up with the irresistible beauty of genius.

'Look at her,' whispered the proud father to Malvasia: 'tell me, is not my Elisabetta the fairest maiden, as well as the greatest painter, in all Bologna?'

The good old ecclesiastic smiled, and assented. 'She looks as happy as if she had a foreshadowing of the good news I bring,' he answered.

'About the holy fathers of Certosa?' eagerly asked Sirani. 'What! have they determined—and for Elisabetta?'

'Yes,' laconically said the conte.

'Elisabetta—Elisabetta mia,' cried the delighted Andrea, who had long since forgotten his jealousy in fatherly love and pride, 'you are successful; the good padri of Certosa have chosen you to paint the altarpiece!'

Elisabetta darted forward with unconstrained delight, and clapped her hands, a token of pleasure which was natural to the almost childlike simplicity of her character, which no honours could change. She kissed the hands of Malvasia, and thanked him over and over again.

'But, my dear child,' said the benevolent conte, 'you are only at the commencement of the journey, and you seem as joyful as if the goal were attained. Do you know what is the chosen subject of the picture? A grand and difficult one—the Baptism of our Lord. Have you any idea of the manner in which you will treat it, Elisabetta?'

'I will show you, Signor Conte.' She took a sheet of paper, laid it on her knee, and with a brush dipped in Indian ink, began to dash in the first sketch of her composition with wonderful rapidity and power.

'Will this please you, monsignor?' timidly said Elisabetta at last, holding up the design of the picture which was afterwards the pride of the monastery of Certosa, and the work on which the fame of Elisabetta Sirani chiefly rests.

Ere the father and Conte Malvasia could find words for their delight, Ginevra Cantofoli entered. There was a heavy sadness over her face, and a wild look in her eyes, which spoke of some inward trouble. Elisabetta, in her unconscious delight, threw her arms round her friend's neck, and told her of her happiness; but Ginevra recoiled as from the touch of a serpent.

'Then it is you who have taken from me my heart's desire?' she said bitterly. 'I sought this favour; but the padri, like all the world, thought me your inferior. I suppose I shall live and die so, Elisabetta?' she added, recollecting herself, and attempting a forced smile.

'Why did you not tell me of this, Ginevra?' said Elisabetta gently.

'Because I resolved for once to think and act for myself: I have failed; now let us forget it,' answered the other.

But Ginevra did not forget it; and year after year that added to Elisabetta's fame, only buried the poison deeper in the heart of her rival.

At last, added to all other jealousies, came the one excited by love. From the city of Parma, where he had been completing his studies in art, came Battista Zani, once the pupil of Sirani, and now the betrothed of Ginevra Cantofoli. Young, enthusiastic, overflowing with genius, and all that could win a maiden's love, no wonder was it that Battista was almost idolised by the girl he had chosen to be his wife one day. And when, like all who came within the circle of her presence, he yielded to the magic influence of Elisabetta Sirani, and felt and expressed towards her a regard and reverence almost approaching to the saint-worship of his church, Ginevra's very heart was rent asunder with jealousy. Sometimes, in his simplicity and utter unconsciousness of evil, Battista talked to his betrothed of Elisabetta, of her saint-like beauty—upon which he delighted to look, with that worship of all things pure and lovely which was so deep in his artist soul—of her unworldliness, her genius; and all this was to Ginevra the most exquisite torture. Then, too, in the frank admiration and friendly interest which Elisabetta showed

towards the young painter, whose talents gave promise of such wondrous fruits, Ginevra saw nothing but the preference of love, for she could not imagine the possibility of any maiden's beholding her own Battista without loving him. And truly with many she would not have been far wrong; but it was not so with Elisabetta Sirani.

After a time spent in his native Bologna, the artist determined to go to Rome.

'Would that I too were going to Rome—beautiful Rome!' said Elisabetta when Battista came to bid her adieu. 'How pleasant to see all its wonders—to behold the glorious Capella Listina of which we have so often dreamed, Battista! I would that I were going also!'

'Then why not, Madona Elisabetta?' cried the young painter eagerly. 'It would be so happy to see Rome with thee!'

Elisabetta smiled quietly. 'Thou forgettest my father, my home. How could I leave all these, good Battista, even to go to Rome?'

'Then I will think of thee always, Madona. In my memory, in my prayers, thou shalt visit Rome.'

'Be it so, kind Battista,' smilingly answered Elisabetta, as she gave him her hand, which he kissed with reverence, and departed with Ginevra.

'Is she not an angel, this Madona Sirani, to speak so kindly to a poor artist like me?' he said to his betrothed. 'But ere I see her again, I may be more worthy of her goodness. Dost thou not think so, Ginevra mia?'

'Yes,' answered Ginevra in a low and changed voice, while a horrible determination made her hands clench and her eyes flash fire. But Battista saw it not; he was wholly absorbed in those delicious dreams of coming glory which too often fade like a morning cloud.

'La Signora Elisabetta desires her spiced draught,' said the old nurse, coming from the painting-room one day. 'Get it ready for her quickly, Benedetta.'

Benedetta, a young country girl whom Elisabetta had educated, and who loved her mistress with passionate tenderness, went speedily about her task.

'Thou art putting too much cinnamon, silly child,' said the old woman.

'It is not cinnamon, good mother; it is another spice that I bought the other day. The woman who sold it said it would do Madona good, and that I must give it to her every day. And truly she was right, for I never saw the signora's eyes look so bright as yesterday.'

So the young girl carried the cup to her mistress, and watched her with affectionate looks while she drank her favourite beverage of sugar, cinnamon, and water. How little did either know that this day it was a draught of deadly poison!

An unaccountable illness seized upon the doomed Elisabetta. It was little dreaded by those who best loved her; but she herself felt an utter languor—a strange overpowering sensation, which gave her a fore-shadowing of the coming death. When Ginevra, whom her summons had brought, stood beside her, Elisabetta spoke to her early friend with an affectionate seriousness, beyond her wont, of the beloved art they both followed—of Ginevra's future life—of her lover.

A look at once full of hatred and despairing grief came over Ginevra's face; but Elisabetta went on—'I always loved thee, Ginevra, and thy Battista too; and if I recover—'

'Thou wilt die; thou art dying now,' said Ginevra in a low and hissing whisper. 'Thou hast been my bane through life, my rival in all things; last of all, in Battista's love. I have poisoned thee.'

A shudder convulsed Elisabetta's frame, but she did not shriek: awe, not terror, possessed her, as she heard of her certain doom. Her lips moved long in a wordless prayer; then she looked calmly at Ginevra, who stood beside her like a statue of stone, and said, 'Thou art deceived; I never loved any man; my life was devoted

to God and to divine art. Thy Battista wooed me not, Ginevra: he never loved but thee.'

In utter abandonment of remorse the murderess sued for pardon at her victim's feet. 'Denounce me: thy death will be slow: let me die before thee, as an atonement.'

'Not so,' faintly answered Elisabetta; 'the secret be between thee and me. Let not my father know that his child died by poison. The holy saints forgive thee, as I do. Ginevra, live, and be happy with thy betrothed.'

'It is too late,' shrieked Ginevra; 'Battista is dead!'

It was indeed so. Battista Zani died at Rome, soon after his arrival, leaving behind him only the memory of the genius which had promised so much, and which perished in its early blossoming. His name, chronicled by Malvasia, is all that remains to posterity of Battista Zani.

Elisabetta Sirani died by this mysterious and horrible death in her twenty-sixth year. Many surmises arose as to the fatal cause, some approaching near the fact, others wild and contradictory. Amidst the pomp of splendid obsequies, the maiden artist was laid in the tomb of Guido Reni. The orator Picinardi poured forth a torrent of eloquent lamentation over the beloved dead; solemn music sounded through the church of St Domenico; and the whole city mourned over the pride of Bologna.

But while poets wrote her elegy, and sculptors adorned her costly monument, the memory of Elisabetta remained, like that of a departed saint, in her father's house; at first sorrowful, afterwards bringing only holy and solemn thoughts. They spoke of her genius; of her humility, which scorned not all the lowly but sweet offices of home; of her beauty, made still lovelier by the calm dignity with which, knowing she was fair, she gloried not in it; and of her pure and holy mind, which, though not too proud for earth, ever turned heavenward, as if there was its true home. And thus, like the continual perfume of virtue and of holiness, which death cannot take away, lingered on earth the memory of Elisabetta Sirani.

Andrea Sirani survived his eldest daughter many years. His two other children, Barbara and Anna, also became artists; and there is still extant a graceful sonnet of Picinardi, addressed to Barbara Sirani, who had painted from memory the portrait of the lost Elisabetta.

Of Ginevra Cantofoli, all that need be said is, that she lived and she died.

SIR JAMES ROSS'S VOYAGE OF DISCOVERY.

THE desire which has so long prevailed for correct information respecting the famous discoveries in the antarctic regions, will now be gratified by the publication of the two handsome volumes before us.* To the general reader they will be far less attractive than Sir George Simpson's overland travels; but to the meteorologist, geologist, and botanist, the material they furnish is invaluable. The enterprise was important not merely in a geographical and commercial point of view, data were to be collected by which to determine many involved points of natural science, and nobly and gallantly have the objects of the expedition been accomplished. No vessels ever sailed so well and completely equipped for scientific investigation, in addition to the usual points of inquiry: magnetism, as is well known, has of late years engrossed much of the attention of learned men; and as the ships were going, so to speak, into the head-quarters of magnetism, the scientific committees of the Royal Society drew up a series of instructions for the guidance of the officers in their observations on the dip, variation, and intensity. With everything that could contribute to the health and comfort

* A Voyage of Discovery and Research in the Southern and Antarctic Regions, during the years 1839-43. By Captain Sir James Clark Ross, R.N. London: John Murray. 1847. 2 vols.

of the crews, there was nothing beyond natural difficulties to overcome in collecting the facts of most importance to science. We have ample observations on meteorology and magnetism—the determination of the position of the southern magnetic pole—the direction of ocean currents—of unusual degrees of depth—the line of mean temperature, separating, as it were, the extreme Southern Ocean from that more to the north, where the temperature is the same, whatever may be the depth to which the thermometers are sunk. The departments of zoology, botany, and geology have also been enriched with new specimens, many of them likely to prove of considerable value. Obscure and doubtful points have been cleared up; new whaling grounds, and a great southern continent, have been discovered; the latter terminated by volcanic mountains, compared with which Etna and Hecla sink into insignificance.

The two ships, the *Erebus* and *Terror*, the latter under Captain Crozier, sailed in September 1839: the scientific inquiries began in the Bay of Biscay, with measures of the height of the waves and determination of the specific gravity and temperature of the sea: at a depth of 300 fathoms, the water was found to be from 10 to 15 degrees colder than at the surface. At Madeira the highest mountain was measured; and on leaving St Jago, hourly observations on the barometer were commenced, 'chiefly for the purpose of marking the progress of barometric depression in approaching, and reascension in receding from, the equator—a phenomenon represented as being of the greatest and most universal influence, as it is, in fact, no other than a direct measure of the moving force by which the great currents of the trade-winds are produced.' After landing on St Paul's Rocks, for the purpose of magnetic observation, the party crossed the line of no dip, or the magnetic equator; and so definitely was it marked, that the signal showing no dip was hoisted on both ships at the same instant. This line, as well as that of least intensity, extends round the earth in a direction by no means parallel to that of the terrestrial equator. At the beginning of 1840, while crossing the tropic of Capricorn, soundings were obtained at a depth of 2425 fathoms, 'a depression of the bed of the ocean beneath its surface very little short of the elevation of Mont Blanc above it.'

Some interesting observations on the strength, temperature, and direction of currents were made in beating up to and leaving the Cape of Good Hope. The next rendezvous of the ships was at Prince Edward's Island, to which place Sir James Ross had volunteered to convey the supply of provisions for the sealing parties. Great difficulty was experienced in making the anchorage, in consequence of the continuance of stormy weather. A party on shore was seen. 'Mr Hickley, their leader, came on board, and he, as well as his boat's crew, looked more like Esquimaux than civilised beings, but filthier far in their dress and persons than any I had ever before seen. Their clothes were literally soaked in oil, and smelt most offensively; they wore boots of penguins' skins, with the feathers turned inwards. They told us that the weather had been so tempestuous, that, until yesterday, they had not been able to launch a boat for five weeks; they had therefore been very unsuccessful at the sea elephant fishery, and were disappointed to find that they were not to be removed to "Pig Island" for the winter, which they describe as being so overrun with these animals, that, to use their own words, "you can hardly land for them." The party consisted in all of eleven men, one of whom had been on the island for three years. They seemed to have no wish to return to the Cape of Good Hope, and were quite contented, having plenty of food. The eggs of sea-birds in the breeding season may be collected by boat-loads, and are said to be excellent food, particularly that of the albatross, which averages above a pound in weight; and the young birds, when first taken from the nest, are described by them as being quite delicious. It is possible, however, they may have acquired the Esquimaux taste,

as well as their habits.' It is scarcely possible to imagine a more dreary mode of life than this; and yet such is the wonderful power of adaptation to circumstances of the human mind, that these men are described as contented.

A few days after leaving this storm-beaten locality, 'the first piece of antarctic ice was seen, though so small, as scarcely to deserve the name of an iceberg, being not more than twenty feet high, and evidently fast dissolving, yet it was sufficiently solid to injure seriously any vessel that might run against it. We passed several beds of floating sea-weed, and were accompanied on our course by many of the great albatross, and the large dark petrel; and still more numerously by the speckled cape pigeon, and stormy petrel, of two or three different kinds. These birds added a degree of cheerfulness to our solitary wanderings, which contrasted strongly with the dreary and unvarying stillness of the tropical region, where not a sea-bird is to be seen, save in the vicinity of its few scattered islets, which is the more remarkable where the ocean so abounds with creatures fit for their food.'

In May 1840, the expedition anchored in Christmas Harbour, Kerguelen's Island. The country is of the most barren description, yet a few additions were made to the lists of plants and animals.* Notwithstanding the continued tempestuous weather, the tidal, astronomical, and pendulum observations were carried on without a single interruption. We read that, 'during forty-five of the sixty-eight days the ships were in Christmas Harbour, it blew a gale of wind, and there were only three days on which neither rain nor snow fell. On one occasion the whole body of the astronomical observatory was moved nearly a foot; and had not the lower framework fortunately been sunk to a good depth below the level of the ground, it would have doubtless been blown into the sea. The gusts occur so suddenly,' continues Sir J. Ross, 'that I have frequently been obliged to throw myself down on the beach to prevent being carried into the water; and one of our men, whose duty it was to register the tide-gauge, was actually driven in by one of the squalls, and very nearly drowned.'

It was observed that, during snow-storms, the thermometer fell several degrees, while the temperature of the ocean remained unaltered; the consequence was, a constant succession of snow, from the freezing of the warm mists in their ascent; and in steering from Kerguelen's Island to Van Diemen's Land, a remarkable phenomenon was noticed: the temperature of the sea, which averaged 35 degrees, rose suddenly to 46 degrees, retaining the increase over a space of eighty-six miles, presenting a singular anomaly in the distribution of heat. Just before a storm, meteors in great numbers were seen darting about in all directions. On arriving at Van Diemen's Land, the party heard of the discoveries made in the southern regions by the French and the United States Exploring Expeditions, which determined Sir J. Ross on pushing his researches in another direction, and to endeavour to reach the south magnetic pole on a parallel much to the east of that already selected, in order that the expected discoveries might be altogether of an independent character. On steering again for the south, a halt was made at the Auckland islands, for the comparison of magnetic observations with those of the Hobarton observatory. These islands promise to become of great value in connection with the southern whale fishery. They present great attractions to the botanist, and are well wooded, but the trees are stunted by the continual heavy gales; affording shelter, however, to a thick growth of ferns and flowers beneath. 'The vegetation is characterised by a luxuriance of these fine species, and the absence of such weeds as grasses and sedges, &c. Eighty flowering plants were found; a small number, but consisting of species more remarkable for their beauty and novelty than the Flora of any other country can show, no less than fifty-six being hitherto undescribed.'

* See account of the Kerguelen Cabbage, No. 108.

On the 5th January 1841, the ships were forced into the pack ice of the antarctic regions: through this the adventurers were compelled to work their way, before the grand object of the expedition could be said to be begun. The width of this belt of floating ice was 200 miles. At the end of five days, the vessels emerged from its southern border. To the joy of the crews, an open sea stretched before them, across which they steered directly for the magnetic pole; and soon after they saw the first land, consisting of a series of lofty hills, covered with perpetual snow, visible at a distance of 100 miles. A description of the scene, on a nearer view, possesses much interest:—It was a beautifully clear evening, and we had a most enchanting view of the two magnificent ranges of mountains, whose lofty peaks, perfectly covered with eternal snow, rose to elevations varying from 7000 to 10,000 feet above the level of the ocean. The glaciers that filled their intervening valleys, and which descended from near the mountain summits, projected in many places several miles into the sea, and terminated in lofty perpendicular cliffs. In a few places the rocks broke through their icy covering, by which alone we could be assured that land formed the nucleus of this, to appearance, enormous iceberg.

This was a period of great excitement; the continued fine weather led the adventurers to expect the speedy realisation of their wishes in the discovery of the pole, and they sailed along the land, naming the various heights, as they successively came into view, after some of the most distinguished British philosophers. A few days later they landed on 'Possession Island,' and took formal possession of those desolate regions in the name of the Queen. 'We saw,' to quote the words of the narrator, 'not the smallest appearance of vegetation; but inconceivable myriads of penguins completely and densely covered the whole surface of the island, along the ledges of the precipices, and even to the summits of the hills, attacking us vigorously as we waded through their ranks, and pecking at us with their sharp beaks, disputing possession; which, together with their loud coarse notes, and the insupportable stench from the deep bed of guano, which had been forming for ages, and which may at some period be valuable to the agriculturists of our Australasian colonies, made us glad to get away again, after having loaded our boats with geological specimens and penguins.'

The dredge was frequently put over the side, and dragged at the bottom of the sea for several hours, never failing to bring up specimens of corallines, mollusca, and other animated creatures, from unusual depths. 'It was interesting among these creatures,' writes the captain, 'to recognise several that I had been in the habit of taking in equally high northern latitudes; and although contrary to the general belief of naturalists, I have no doubt that, from however great a depth we may be enabled to bring up the mud and stones of the bed of the ocean, we shall find them teeming with animal life: the extreme pressure at the greatest depth does not appear to affect these creatures: hitherto we have not been able to determine this point beyond 1000 fathoms, but from that depth several shell-fish have been brought up with the mud.'

In January 1841 two volcanoes were discovered; the one extinct received the name of Mount Terror; the other, in full activity, 12,000 feet in height, was named Mount Erebus. An eruption is thus described:—'At four p.m. Mount Erebus was observed to emit smoke and flame in unusual quantities, producing a most grand spectacle. A volume of dense smoke was projected at each successive jet with great force, in a vertical column, to the height of between 1500 and 2000 feet above the mouth of the crater, when, condensing first at its upper part, it descended in mist or snow, and gradually dispersed, to be succeeded by another splendid exhibition of the same kind in about half an hour afterwards, although the intervals between the eruptions were by no means regular. The diameter

of the columns of smoke was between 200 and 300 feet, as near as we could measure it: whenever the smoke cleared away, the bright red flame that filled the mouth of the crater was clearly perceptible; and some of the officers believed they could see streams of lava pouring down its sides, until lost beneath the snow which descended from a few hundred feet below the crater, and projected its perpendicular icy cliff several miles into the ocean.' The farther progress of the party southwards was here arrested by a precipitous wall of ice, 200 feet in height, estimated at more than 1000 feet thick, along which they sailed for 450 miles, but saw no appearance of an opening. Unwilling, however, to return without reaching the magnetic pole, they continued their explorations until February, when the rapid formation of young ice, and other indications of the approach of winter, compelled them to put about when at a distance of 160 miles only from the point they were seeking. Sir James Ross was desirous of wintering in sight of the great volcano, in hopes to visit the mountain and the pole by exploring parties in the spring; but was obliged to forego his wishes, from obstacles of an insurmountable nature. The great southern continent, whose coast-line had been traced from the 70th to the 79th degree of latitude, was named Victoria Land, constituting the remotest verge of southern discovery.

While beating to the westward, the vessels were placed in situations of extraordinary danger, but providentially escaped them. Soundings were at one time obtained with 1540 fathoms of line, to which a weight of 336 pounds was attached, that occupied 24½ minutes in running to the bottom. In April the party arrived again at Van Diemen's Land, having made their most important discoveries in the course of the preceding five months.

In July 1841 they sailed a second time to encounter the perils of a polar voyage. The line of uniform temperature was observed; a little to the south of which a thick fog coming on, rendered frequent signals necessary to prevent the ships parting company. We quote the passage as to the relative utility of these signals:—'To us the bell was most distinct, and the gong very little inferior, when the musket was scarcely audible; but I was much surprised at this time, on hailing through a speaking-trumpet, to receive an immediate and so clear an answer from the officer of the watch of the Terror, that we might have carried on a conversation.' The pack ice on this occasion was found to present a more formidable impediment than on the former voyage. A gale of wind came on while the vessels were struggling through the tortuous channels. 'Soon after midnight, our ships were involved in an ocean of rolling fragments of ice, hard as floating rocks of granite, which were dashed against them by the waves with so much violence, that their masts quivered as if they would fall at every successive blow; and the destruction of the ships seemed inevitable from the tremendous shocks they received. By backing and filling the sails, we endeavoured to avoid collision with the larger masses; but this was not always possible. In the early part of the storm, the rudder of the Erebus was so much damaged as to be no longer of any use; and about the same time I was informed, by signal, that the Terror's was completely destroyed, and nearly torn away from the stern-post. We had hoped that, as we drifted deeper into the pack, we should get beyond the reach of the tempest; but in this case we were mistaken. Hour passed away after hour without the least mitigation of the awful circumstances in which we were placed. Indeed there seemed to be but little probability of our ships holding together much longer, so frequent and violent were the shocks they sustained. The loud crashing noise of the straining and working of the timbers and decks, as she was driven against some of the heavier pieces, which all the activity and exertions of our people could not prevent, was sufficient to fill the stoutest heart, that was not supported by trust

in Him who controls all events, with dismay.' At one time 'the Terror was so close to the Erebus, that when she rose to the top of one wave, the Erebus was on the top of that next to leeward of her; the deep chasm between them filled with heavy rolling masses; and as the ships descended into the hollow between the waves, the main-top-sail yard of each could be seen just level with the crest of the intervening wave from the deck of the other: from this some idea may be formed of the height of the waves, as well as of the perilous situation of our ships.' The vessels happily escaped the danger, and after a few days, their damages were effectually repaired: they were, however, fifty-six days in forcing their way through the belt of ice, which had only hindered them five days in the previous voyage. From the great delay, but little time remained for exploration; the icy barrier was explored to a distance ten degrees further east; and after reaching a higher point of latitude by six miles than on the former occasion, the vessels bore up for the Falkland Islands. They had crossed the antarctic circle, when a danger more formidable than those already encountered awaited them. Involved among icebergs, with a heavy sea, the Terror drove down upon the Erebus. 'We instantly,' pursues the captain, 'hove all aback, to diminish the violence of the shock; but the concussion, when she struck us, was such as to throw almost every one off his feet; our bowsprit, fore-topmast, and other smaller spars, were carried away; and the ships, hanging together, entangled by their rigging, and dashing against each other with fearful violence, were falling down upon the weather face of the lofty berg under our lee, against which the waves were breaking and foaming to near the summit of its perpendicular cliffs. Providentially, we gradually forced past each other, and separated before we drifted down amongst the foaming breakers; and we had the gratification of seeing her clear the end of the berg, and of feeling that she was safe. . . . The only way left for us to extricate ourselves from this awful and appalling situation, was by resorting to the hazardous expedient of a stern-board, which nothing could justify during such a gale, and with so high a sea running, but to avert the danger which every moment threatened us of being dashed to pieces. The heavy rolling of the vessel, and the probability of the masts giving way each time the lower yard-arms struck against the cliffs, which were towering high above our mast-heads, rendered it a service of extreme danger to loose the mainsail; but no sooner was the order given, than the daring spirit of the British seaman manifested itself; the men ran up the rigging with as much alacrity as on any ordinary occasion; and although more than once driven off the yards, they after a short time succeeded in loosing the sail. Amidst the roar of the wind and the sea, it was difficult both to hear and to execute the orders that were given, so that it was three-quarters of an hour before we could get the yards braced by, and the main-tack hauled on board sharp aback—an expedient that perhaps had never before been resorted to by seamen in such weather. But it had the desired effect; the ship gathered stern-way, plunging her stern into the sea, washing away the gig and quarter-boats, and with her lower yard-arms scraping the rugged face of the berg, we in a few minutes reached its western termination; the "under-bow," as it is called, or the reaction of the water from its vertical cliffs, alone preventing us from being driven to atoms against it. No sooner had we cleared it, than another was seen directly astern of us, against which we were running; and the difficulty now was to get the ship's head turned round, and pointed fairly through between the two bergs, the breadth of the intervening space not exceeding three times her own breadth. This, however, we happily accomplished; and in a few minutes after getting before the wind, she dashed through the narrow channel between two perpendicular walls of ice, and the foaming breakers which stretched across it, and the next moment we were in smooth water under its lee.'

No time was lost in repairing damages in the best way that circumstances would permit: the vessels arrived at the Falkland Islands in April 1842, where they were thoroughly refitted. Hunting parties were sent out to chase the wild cattle that abound in many parts of the islands, feeding on the tussock grass, to provide a store of fresh provisions. The details are interesting, but we have not space for quotation. Ample researches were made on the geology, zoology, and botany of these islands; many facts in connection with the latter, and descriptive of the tussock grass, have already been published.* In September 1842, it being thought necessary to institute a series of magnetic observations in the vicinity of Cape Horn, the vessels sailed for the bay of St Francis, Terra del Fuego, and brought up in St Martin's Cove, near Hermite Island. Of the cape, Sir James Ross remarks:—'The poetical descriptions that former navigators have given of this celebrated and dreaded promontory, occasioned us to feel a degree of disappointment when we first saw it; for although it stands prominently forward, a bold, almost perpendicular headland, in whose outline it requires but little imaginative power to detect the resemblance of a "sleeping lion, facing and braving the southern tempests," yet it is part only of a small island, and its elevation, not exceeding five or six hundred feet, conveys to the mind nothing of grandeur. But the day was beautifully fine, so that it is probable we saw this cape of terror and tempests under some disadvantage.' While at anchor in the cove, the party were visited by some of the native Fuegians, described 'as the most abject and miserable race of human beings. They are admirable mimics, and were fond of the company of our people, singing and dancing with them, and entering into every kind of fun, for which seamen are so famous; and it was both amusing and interesting to witness their attempts to repeat the words and tunes of songs, which they accomplished with a wonderful degree of facility. Landing one morning unexpectedly, I found our people teaching them to wash their faces; but the soap making their eyes smart, their ablutions were afterwards confined to the feet and hands. They then powdered their hair with flour, and decorated them with ridiculous ornaments, the natives greatly enjoying their altered appearance, heightened in no small degree by the present of a complete suit of clothes to each, and many useful articles they got on ship-board.'†

On leaving the anchorage, eight hundred plants and trees were taken from Hermite Island, to be planted in the Falklands, with a view to add to the vegetable resources of the latter islands. The vessels sailed in December 1842 on their third and last voyage to the south. The incidents were of a nature similar to those already narrated; and the voyage, on the whole, was the least successful of the three. In April 1843, the ships anchored at the Cape of Good Hope. Between Ascension Island and Rio Janeiro, 27,600 feet of line were run out without finding bottom, the greatest depth of the ocean hitherto examined with any degree of accuracy; and in September of the same year, the intrepid adventurers landed in England.

AIDS IN SWIMMING.

SOME persons have supposed that the only reason why a man, however unaccustomed to the water, does not swim as well as one of the lower animals, is, that the former has more dread of the foreign element; and they assert that all we have to do, in order to float, is to discard fear, and trust implicitly to the natural buoyancy of our bodies. But this comfortable theory is at most not more than half true. When one of the lower animals finds himself in the water, he is in his natural posture for movement, and plies his feet to escape from the danger, just as he would on land in the action of running. Man, on the contrary, if he would use the

* See No. 598, old series.

† See No. 79, new series.

four paddles with which nature has provided him, must throw himself prone on his face, abandon all his usual habits of motion, and attempt to push himself on against the water with his palms and soles, and at the same time manage in such a way, when drawing them in for a new stroke, as to prevent the preceding effort from being neutralised. Swimming, therefore, is an instinct with the brute, but an art with the man. That fear, however, impedes the progress of a man in *learning* to swim, is perfectly true. It deprives him of the presence of mind necessary for acquiring an art in circumstances of apparent danger; while the very same feeling gives added energy to the instinctive motions of the brute. Many tribes of horses and dogs are vastly more timid than man; and the only reason why the former move with comparative safety in the water is, that in the action of swimming they have merely to obey a natural impulse. When the writer of these lines was a boy, some pains were taken to teach him to swim, and he acquired without much difficulty the theory of the art. But the practice was quite another thing: he no sooner raised his feet from the ground, than down he sank like a stone, till he at length believed that some physical peculiarity rendered swimming an impossibility for him. The peculiarity, however, turned out to be moral, not physical. One day, on the shores of one of the Western Islands, he was bathing in the company of a huge Highlander, and having laid his clothes upon the cliff, was about to descend to a little creek, where the water was smooth and shallow, and the sand soft and white. In front of the rocks was a natural basin, in which a frigate might have swam, with the circling sands of the beach at some little distance beyond; and into this basin rolled the smooth majestic swell of the Atlantic. When about to descend, he was caught up by the giant, and pitched over the cliff like a clod, and found himself, with a shout of mingled wrath and terror, struggling in the hitherto impracticable element! Now, had he not previously learned to swim, he must have sunk, or owed his extrication to his well-meaning friend; but being acquainted with the art, he did swim, like a duck, to the opposite sands—although so little grateful was he for the lesson he had now been taught, that his supposed inability was mere cowardice, that the first thing he did, on regaining his feet, was to fire a volley of stones at his instructor.

Everybody knows that to persons well acquainted with the art, it is possible to rest for a certain time in swimming, by lying upon the back; but this can only be done in perfectly smooth water; and in other attitudes, the body, however great its buoyancy, must be kept constantly trimmed by the motion of the hands and feet. It is not surprising, therefore, that so many plans have been tried for obtaining an independent buoyancy. Every season we hear of some new invention with reference to this grand desideratum; for the attempts that were formerly made to increase the force of the swimmer's movements appear to be abandoned as chimerical. The gloves, for instance, with web fingers, are quite unsuited to our muscular power, which finds the resistance offered by the water to our naked hands quite great enough. The same thing may be said of the attempts to provide the feet with similar contrivances, intended to expand when shoved against the water, and to close at the return. But we are not sure that the 'swimming skate,' invented in France a few years ago, has attracted so much attention as it would seem to deserve, from the circumstance of its being the only contrivance (so far as our knowledge of the subject goes) the effect of which is to place man, when swimming, in his usual walking attitude.

The swimming skate is a piece of wood, furnished with two parallel rows of plates, folding over each other, so as to resemble in some degree the laths of a blind. These open or shut, according as the foot to which the skate is attached moves downwards or upwards; and the swimmer advances by the alternate motion of his limbs, as in mounting a stair, keeping the head and

body a little forward, as in skating. By the aid of this instrument, he is able, it is said, to remain stationary in the water; but we presume this can only be for a short determinate time. At any rate, he can turn in any direction he pleases, raise himself out of the water as high as the girdle, and continue the exercise almost as long as that of walking. In order to plunge to the bottom, he has only to raise himself, by quick motions of his limbs, as high above the surface as possible, and then point the toes downwards.

We presume it is some instrument like this which assists in the exhibition, not uncommon in this country, termed 'walking in the water;' but the experiment of *adding* to the swimming skate the inflated cape or belt might be worth trying. The latter, and all similar contrivances, however valuable, as affording the means of floating, rather diminish the facility of motion than otherwise, from the addition they make to the volume of the body. The grand thing to be sought after is the power of movement through the water, in union with perfect safety in the water: the latter we cannot think derivable from the skates alone, while without them, the accidental rupture of the air-vessels would be fatal.

The part which the lower animals take in this question reminds us that, as among them there are tribes even of the same species better adapted for swimming than others, so there may be families of mankind that take to the water as naturally as Newfoundland dogs. This is affirmed by Sir George Simpson of the Sandwich Islanders, who, he says, 'may almost be said to be born swimmers; for they actually take the water before they leave the breast. At Lahaina, in particular, I was highly amused with the early development of this innate talent. Through the town there runs, or rather creeps, a sluggish streamlet, into which urchins that were hardly able to stand used to crawl on all fours; but no sooner did they gain the congenial element, than they struck out like young fish, diving, and ducking, and performing a variety of feats with confidence and ease.' The art, thus early learnt, is highly important in after-life; for if an islander founders at sea, he is quite undisturbed even if he should find himself in the midst of a shoal of sharks.

In what has been said regarding artificial aids in swimming, we would by no means be understood to advocate the use of such instruments by those who merely enter the water for healthful exercise. Nothing can be better for the purpose than swimming as it is usually practised; and as the accidents that expose us to drowning do not commonly come at convenient times, it would be folly to trust to our having the preventive apparatus always ready. A man is much more likely to have it in his power to save his life by swimming, than by belts and skates; but appliances like the latter possess the same kind of scientific interest we attach to balloons, with a greater probability, as knowledge advances, of becoming practically useful.

THE KING'S GOOD-NIGHT.

IN our day, the bedchamber is consecrated to the darkness, silence, and solitude befitting a place set apart for rest; but this is a modern innovation upon the wisdom of our ancestors, who in some measure slept, just as they ate and drank, in public. Charlemagne and other princes held *lits de justice*, hearing causes, and dispensing justice, in bed; and long after this custom was abandoned, except in name, Louis XIV. established a system of etiquette which converted the retirement for the night of the French monarch into as imposing a ceremonial as if it had been an abdication of the throne. It is fortunate for us of a later age that Louis the Magnificent (for the Great is a misnomer) never condescended to any exhibition, whether trifling or important, without taking care that the world should be acquainted with its details. It was his royal will to do; but having done, it became his bounden duty to make public the

manner of the doing, for the benefit of mankind, and as a rule to all succeeding monarchs to the end of time. Thus, in his famous expedition into Holland, when he carried across the Rhine the most splendid army ever seen in modern Europe, leaving the whole court in a convulsion of tears and exclamations at the outrageous heroism of the adventure, he transported with him (in addition to his *batterie de la cuisine*) a historiographer to write his conquests. Thus, on betaking himself to his nightly pillow, his slumbers were disturbed by a solemn sense of the duty that had devolved upon him, of letting the world know the form and manner in which he had extinguished himself for the night.

It must have been a consolatory reflection to this great prince, when submitting to death in 1715, that, three years before, a work had been published which described, with an authority sufficient to obviate all doubts and disputations, the way in which he had been in the habit of going to bed. The book containing this important matter is entitled '*L'état de la France*;' and the chapters referred to are headed thus:—

1. Preparations for the coucher of the king.
2. Great coucher of the king.
3. Little coucher of the king.
4. Remarks on the coucher of the king.

In the evening, according to this work, which is now extremely scarce, the officers of the goblet brought into the bedchamber the collation of the night—a precaution against royal thirst or hunger—consisting of three loaves, two bottles of wine, and a flagon of water, with a glass, a cup, three plates, and half-a-dozen napkins. The collation was received by a valet-de-chambre, in whose presence one of the officers of the goblet tasted the different articles. Another valet placed in readiness the royal arm-chair, laying upon it a pair of slippers of the kind called *mules*, and hanging over its back the robe-de-chambre. The barber in the meantime arrayed upon a table the combs and other dressing apparatus, and the officers of the wardrobe placed the night-dress of the king upon a toilet-table covered with red velvet. Another valet now laid down upon the floor, by the bedside, two cushions, one on the top of the other, for the king to kneel upon in saying his prayers; and the preparations being completed, the courtiers who were permitted to assist at the spectacle took their places in the room.

Now enters upon the scene the personage for whom the stage has been thus arranged. He appears at the door of his closet leading into the bedchamber, where he finds in waiting the master of the wardrobe, to whom he delivers his hat, gloves, and cane; and these are transferred by this functionary to a valet of the wardrobe, who carries them to the toilet-table, and lays them down upon its red velvet cover. The huissier of the chamber then marshals the king's way through the assembly to the cushions at the bedside, and his majesty kneels, the almoner of the day holding a light in his hand, and fortifying the royal petitions by saying at the end, in a low voice, *Quæsumus, omnipotens Deus, ut formulæ tuæ, rex noster Ludovicus, &c.* The light held by the almoner, it must be remarked, is a flat candlestick with two sockets, and therefore two wax candles. This was in itself a grand distinction; for persons of inferior rank, such as a queen or a prince of the blood, were restricted, when saying their prayers, to a candlestick with one socket.

On rising, the first valet-de-chambre takes the candlestick from the almoner, and receives from the king his purse of relics and his watch; and then the huissier of the bedchamber marshals his majesty's way through the assembly to his arm-chair. When he is seated there, the grand-chamberlain demands of him who is to have the honour of holding the candle. This is an important question, and must not be answered as if at random. The king glances slowly round the throng, who are supposed to stand in breathless expectation, with glistening eyes and beating hearts, and at length

fixes upon some fortunate individual, probably a prince or a foreign grandee.

The king now stands up, unbuttons his coat and unfastens his girdle, and the master of the wardrobe takes off the royal coat and waistcoat, and sends them away one by one to the red velvet toilet-table. The king takes off his cravat himself, and gives it to the master of the wardrobe, who hands it to one of his valets, who lays it upon the red velvet toilet-table. His majesty then sits down again, and the first valet-de-chambre and first valet of the wardrobe, one at each side, unbuckle the diamond clasps of his garters, and take off his shoes, stockings, &c.; the former of these officers presiding over the right leg, and the latter over the left leg; and each sending away to the red velvet toilet-table his own part of the spoils of royalty by a valet of his own department. In the meantime, two other valets stand behind the chair, holding the robe-de-chambre ready to be put on as soon as the underclothing is changed; and this change being effected—usually with the assistance of the courtier of the highest rank—and the robe-de-chambre assumed by his majesty, and the relics hung round his shoulders, the grand drama closes by the principal personage getting up from the arm-chair (which is instantly drawn away to its usual place) and dismissing the assembly with a bow.

Such is the great coucher of the king, in which it must be noted that each of the actors has his own assigned part. One man has charge of the right leg, foot, or arm, as it may be; another of the left leg, foot, or arm; and nothing must be given direct to the king, but come to him through intermediate channels. The relics, for instance, are taken out of the little purse in which his majesty wears them in the daytime, by the first valet-de-chambre, who transfers them to the grand-chamberlain, who again presents them to the king. The little coucher is a more familiar exhibition that follows the great; and in it the king is seen, both literally and metaphorically, in his nightgown and slippers, by the first physician, the first surgeon, and a few other persons who are permitted to remain after the court has retired, in obedience to his majesty's bow, and the exclamation of the huissier of the bedchamber, '*Allons, messieurs, passez!*'

At the little coucher, the arm-chair is not resumed; the king, being determined to unbend before his private friends, seats himself on a trussle-stool, where he suffers the barbers to have the honour of combing his royal hair. He even combs it himself; while one valet-de-chambre holds a mirror before him, and another illuminates the operation with a candle. When he is combed, a valet of the wardrobe carries on a salver a nightcap and two handkerchiefs to the grand-master, and the latter presents them to the king. His majesty now wipes his face and hands with a towel; but to avoid the risk of mistake on so important a matter, we must translate more closely than hitherto from our guiding authority. 'In the affair,' it says, 'of giving the king the towel with which he wipes his face and hands, the grand-chamberlain, or first gentleman, yields the honour to any prince of the blood; but with this difference, that in the case of Monseigneur the Dauphin, Messeigneurs the Dukes of Burgundy and Berry, and Monseigneur the Duke of Orléans, it would be from the grand-chamberlain or first gentleman they would receive the towel: whereas the other princes of the blood would receive it from the hands of a valet-de-chambre. In the absence of all such princes, the grand-chamberlain, or the first gentleman, or the grand-master of the wardrobe, presents to his majesty, between two vermillion plates, this towel, one end only of which is wet. The king washes his face and hands with the wet end, dries them with the dry end, and then returns it.'

The graver business of preparing for bed being now over, the king goes into his closet to amuse himself for a moment with caressing his dogs, and perhaps feeding them, while the servants of the bedchamber (distinct

from the valets) arrange and warm his bed, and prepare, at its foot, the *lit de vieille*, or watching-bed, in which the first valet-de-chambre sleeps. They then bring this officer a 'well-rinsed glass' on a plate, to present to his majesty filled with wine and water, and finally light the wax candle that is destined to burn all night, and the mortar, which is placed away in a corner. This mortar is a vessel of silver or copper, in the form of a pounding-mortar; and it is filled with water, in which swims a piece of yellow wax as large as a man's fist, with a wick in the middle. The prescribed weight of the piece of wax is half a pound—that is, half a royal pound, which consists of only fourteen ounces instead of the vulgar sixteen. The wax candle, also lighted, is in a silver candlestick, and placed upon the floor in a silver basin; and so the great king, having heroically achieved the ceremonial of his coucher, and being provided with a subdued light whereby to sleep, at length lays himself down in his bed, and with noiseless steps and profound bows the beholders back out of the presence, and leave him alone in his glory.

'Louis,' says the smart Jules Janin, 'carried into everything a spirit of regularity and pomp. He impressed the seal of royalty even upon the smallest details. Monarchy was in his eyes a religion, of which he was at once the god and the priest; and, full of the idolatry, the most common of his actions appeared to him as something solemn and sacred.' The great and little lever were as great and little as the great and little coucher; and even his hunting was an affair of prescription and etiquette, in which men and beasts alike submitted to royal rule. The sportsmen were of a certain fixed station and dignity; the forest was intersected with roads, which left no room for wandering or uncertainty; the hounds were docile and obedient. Louis arrived at the hunt in his carriage, and mounted his horse to a flourish of horns. The stag set off on his hopeless run, and having reached, at the proper time, the determined spot, he was then and there brought down by the royal hand. This last part of the ceremonial survived till recent times. One day a stag bounded out of an alley in the Bois de Boulogne, but having been hurt while they were turning him into the proper course, he fell down dead at the Porte Maillot, where a crowd of huntsmen and spectators were assembled. The throng was arranged by the valets in two parallel lines, between which the sovereign for the time being advanced, in obedience to the transmitted laws of Louis XIV., and gravely fired into the bowels of the lifeless brute. There was a young man among the bystanders, an obscure clerk in an office, whose name is remembered—it was Béranger; and in the hero of the magnanimous exploit he saw for the first time the 'man of destiny,' the foe, slave, and victim of legitimacy—Napoleon.

The last coucher of Louis was held in the year 1715, and at that season when the falling leaves gave a more touching charm to the enchantments around his palace. The poor king had already shed his leaves: he had seen three generations of his descendants die away from him—all but one little boy. When he felt within him the summons of the Angel, and took to his last bed, he said to the servants who were weeping at his feet, with reference, perhaps, to his own thoughts rather than to theirs—'Did you think I was immortal?' His speech to Madame de Maintenon contained an expression of his hope that they should meet again in eternity; but the widow of the poor burlesque poet, whom licentiousness had made a mistress, and superstition a wife, though not a queen, did not like the rendezvous. She left the room and the palace, sulky and silent, and he was afterwards obliged to send for her to Saint Cyr. The court were not admitted to that melancholy coucher. They remained in the gallery behind the bedchamber; while the great officers of state and the princes and princesses of the blood were in an adjoining apartment, and only the physicians and personal attendants in the anteroom. On the 1st of September, at a quarter past eight o'clock

in the morning, a voice startled even the ears that had been expecting it. It was that of the first gentleman of the bedchamber, who, throwing open the window, cried out three times, 'The king is dead!—the king is dead!—the king is dead!' He then broke his baton of office, took another, and exclaimed—'Long live the king!'

THE SCIENCE OF ADULTERATION.

SOME years ago, when the consumption of tea was less than one-fifth of its present average, a report of the committee of the House of Commons stated that the quantity of factitious tea which was annually manufactured from sloe and ash-tree leaves, in different parts of England, to be mixed with genuine tea, was computed at more than four millions of pounds! There is no reason to believe that this manufacture is extinct: occasional disclosures, in fact, indicate a precisely opposite state of affairs, and lead us to the conclusion that it is carried on with greater secrecy perhaps, but with greater vigour also, than ever. The process of transmutation, by which the sloe, ash, and other leaves were to take on the external appearance of genuine teas, has been divulged on several occasions through the vigilance of the Excise; and it is evidently carried on, on the large scale, with much scientific skill. We learn that the leaves intended for this conversion were first boiled, and then baked upon an iron plate; and when dry, rubbed with the hand, in order to produce the *curl* of genuine tea. They were dyed black by a strong decoction of logwood, and then the process was complete. Modern ingenuity has, however, fallen upon an easier method of procuring the substitute, which is by collecting the tea-leaves which have been already infused, drying them, and curling as before, and they are then ready for use. Detected frauds of the latter kind have been frequently brought under the notice of police magistrates; and the reports of the press state that there exists a class of persons who make a livelihood by going round to the different large hotels and coffee-houses of the metropolis, paying a trifle for the refuse tea-leaves, which they then prepare according to art, for the use of dishonest tea-dealers; the substitute selling for a few pence per pound, and being used for mixture with the cheaper teas sold by such persons. There is no test by which this adulteration can be discovered, excepting the want of flavour and strength; and the unfortunate persons to whom the adulterated article is generally sold, are not those to whom we should look for much discrimination in these particulars.

The dishonesty, however, is not confined to England; it flourishes in almost greater luxuriance in China. The Chinese, in fact, have long enjoyed a bad eminence for all kinds of ingenious frauds. Mr Fortune, in his recent work, 'Wanderings in China,' confirms the testimony of a previous writer, Sir John Francis Davis, in reference to the extensive adulteration of exported teas by the natives. In Davis's work there occurs the following lively and amusing account of a regular manufactory for the production of spurious green teas, situated with unblushing effrontery exactly opposite the European factories at Canton, on the other side of the river. Having with some difficulty persuaded a Kong merchant to procure him admission into one of these laboratories of factitious hyson, he was eye-witness to a novel and curious scene. 'In the first place, large quantities of black tea, which had been damaged in consequence of the floods of the previous autumn, were drying in baskets with sieve bottoms, placed over hot pans of charcoal. The dried leaves were then transferred, in portions of a few pounds each, to a great

number of cast-iron pans, imbedded in mortar, over furnaces. At each pan stood a workman stirring the tea rapidly round with his hand, having previously added a small quantity of *turmeric* in powder, which of course gave the leaves a yellowish or orange tinge; but they were still to be made green. For this purpose, some lumps of a fine *blue* were produced, together with a white substance in powder, which were respectively Prussian blue and gypsum. These were triturated finely together with a small pestle, in such proportions as reduced the dark colour of the blue to a light shade; and a quantity equal to a small teaspoonful of the powder being added to the *yellowish* leaves, these were stirred as before over the fire, until the tea had taken the fine "bloom" colour of hyson, with very much the same scent. The transmogrified leaves were then picked, sifted, chopped small, and supplied to the American merchants as excellent genuine young hyson. The occasion which called this manufactory into activity was curious. A reduction of duty on tea having taken place in America, there was a sudden demand for green teas upon the Canton market to a larger amount than it was capable of supplying. The American vessels were compelled to sail within a certain period, and have the tea they must; and we have just seen *how they got it*. In reference to this subject, Mr Fortune states that it is an ascertained fact, that the Chinese themselves never make use of the teas they prepare for our depraved tastes, and that the delicate green of our 'fine blooming kinds,' in all cases is the result of a *dye*; adding, that were the fashion to change, and were we to prefer *red* or *yellow* instead of green as the complexion of our teas, he has no doubt that the Chinese could readily adapt themselves to the alteration.

The important article bread has got an unhappy notoriety, as being the subject of very extensive and very constant adulteration. The bare mention of the subject must elicit a groan from the bosom of every metropolitan reader, whose dyspeptic, cachectic, creamy countenance is a tremendous witness against the iniquities of London bakers. It has been stated that occasionally as much as one hundred and ninety-seven grains of alum have entered into the composition of a quartern or four-pound loaf. We believe that, generally speaking, this is very considerably over the average quantity. The sale of this article of adulteration, which is the most common one, forms a trade of no inconsiderable amount, and it is retailed under the slang title of 'stuff,' or 'sharp whites.' Some chemical ingenuity is exercised in its manufacture, in order to granulate it so as to resemble salt, with which it is mixed, and thus to avoid the risk of detection by the proper authorities. Though a penalty is in force against its sale and use, the eyes of the law are unable to penetrate to the recesses in which it is employed, or to detect it under cover of the ingenuities by which it is disposed of. There have been alarmists who declare that chalk and Paris-plaster are also upon the list of the adulterations of bread. Mr Brande analysed some biscuits, and he actually discovered as much as ten per cent. of the latter ingredient in them. But the most abominable adulteration conceivable, was one which we have the authority of one of the most eminent chemists for affirming to have been very prevalent a few years ago among the bakers of the north of France and of Belgium, and which produced such serious and even fatal effects upon the persons partaking of the adulterated food, as to bring it under the notice of the courts of justice. An experienced analyst was appointed to investigate the case, and he speedily discovered that the adulteration was none other than the virulent poison, sulphate of copper. Several specimens of the sophisticated bread which he examined were actually of a *bluish* tinge, from the excessive amount of this dangerous substance in them; and in others, minute crystals of the sulphate were found in different parts of the loaf. When it is stated that very minute portions of this preparation are poisonous, the execrable character of the sophistication

will become manifest. As a chemical fact, it is sufficiently remarkable that this substance appears to exercise a most energetic effect upon the fermentation of the dough, stimulating it in a surprising manner, and this in such minute quantities as one 70,000th part of the weight, or one grain to every ten pounds. This action is participated in by alum, but to a more feeble extent. Rice and potatoes, if not adulterations, are, at anyrate, very common additions to the 'pure wheaten bread' of our bakers. It need scarcely be here said that all these adulterations are unnecessary, several of them being positively noxious, and that excellent bread may always be made from good flour without their assistance; it being inferior or damaged flour alone which calls for the adventitious succour of the bakers' 'stuff' to render it a passable-looking and lasting bread.

The adulteration of wine has been an old and favourite topic with writers. We find it thus jestingly alluded to in the graceful satire of the 'Tattler':— 'There is in this city a certain fraternity of chemical operators, who work underground in holes, caverns, and dark retirements, to conceal their mysteries from the eyes and observation of mankind. These subterranean philosophers are daily employed in the transmutation of liquors, and by the power of magical drugs and incantations, raising under the streets of London the choicest products of the hills and valleys of France. They can squeeze Bourdeaux out of the sloe, and draw champagne from an apple. These adepts are known by the name of wine-brewers; and, I am afraid, do great injury not only to her majesty's customs, but to the bodies of many of her good subjects.' England—all praise to its rigid custom-house regulations—is the happy spot where the adulteration of wine has reached its acme of perfection; it has been humorously entitled a universal wine country, where every species is made, if it be not grown. M. Accum, whose work on 'Culinary Poisons' made some noise in its day, has been very bold in his denunciations of the infamous practices of the craft of wine-brewers. He is kind enough to extract for us some of their receipts for the manufacture of 'fine, old, crusted port wine;' and the process is as interesting as it is ingenious. It consists of two distinct processes; first, the 'port' is to be made, and next the bottles are to put on an appearance of old age. Cider, brandy, a small portion of *red* port wine, stewed sloes, and a liberal allowance of genuine water, mixed in certain proportions, produce one of these capital ports. If a certain fragrance, commonly supposed to be peculiar to the juice of the grape, is a little deficient in the wine thus produced, a delightful bouquet is contributed by the addition of divers sweet-scented herbs, or by orris-root, elder flowers, and laurel water. In many cases, no doubt, a vinous odour is produced by the use of small quantities of the liquid known as 'oil of wine.' The pleasant juice of the sloe contributes a port-like roughness to the wine; or a sprinkle of oak sawdust, or a fragment of oak bark, answer the same purpose. A 'fruity' taste is readily afforded by a tincture of raisins; and the rich carbuncle colour may be said to have once flowed in the sap-vessels of the red sanders-wood tree. The young bottles must next be dealt with, and they are handled in a thoroughly master-like manner. Is there a knowing connoisseur, who considers himself a tolerable judge of a good 'crust?' Let him take heed of tincture of catechu and sulphate of lime. Is there one who tears asunder the cork to note the blushing character of its interior? Let him beware of a soaking in decoction of brazil-wood. Or, finally, does any one who will have *his* wine genuine as imported home in the cask, rip up its staves, and look for a rich red layer of cream of tartar therein in glittering crystals? Let him learn that, under the hands of these wine wizards, such a cask may fall into extreme old age in the course of an afternoon. To be serious. These are no exaggerations: the following has been actually given as the chemical

* See No. 58, new series, p. 90.

analysis of a bottle of cheap port wine;* spirits of wine, cider, sugar, alum, tartaric acid, and decoction of log-wood!

The high price of champagne in England is a sufficient temptation to fabricate imitations thereof. Even at our juvenile entertainments, gooseberry wine has become the celebrated representative of this noble liquid; and how far and how frequently this homely guest is found under the former title at tables of a higher caste, had better not be conjectured. It is positively stated, that some years ago, some Frenchmen set up a champagne manufactory in the metropolis, having contracted for a large supply of the freshly-expressed juice of the pears of Herefordshire; and we have the best authority for stating that cochineal, or strawberries, citric acid, grape wine, French brandy, and water, are very common ingredients of sham champagne. We happen to have it within our personal knowledge, that in this metropolis there is in full operation some most ingenious machinery for the sole purpose of impregnating such wines with the gas which contributes so much of the brilliancy of appearance and piquancy of flavour to the veritable fluid. Such wine is bottled in the proper champagne bottles; and—will it be credited?—the compressed appearance of the cork of real champagne is imitated by corks cut purposely of precisely that distressingly tumid appearance! Cover it with tinfoil, powder it with sawdust, and the counterfeit may be securely committed to the gullibility and gullets of an unsuspecting world. Ardent spirits are adulterated to an equal, in some cases even to a greater extent; and few but those who brew their own 'pecks o' maut,' can hope to have beer altogether free from adulteration. We will close this part of our subject with an anecdote which passes for truth. George IV., in his days of early dissipation, possessed a very small quantity of remarkably choice and scarce wine. His suite, appreciating its value, and deeming it forgotten, exhausted it almost to the last bottle, when they were surprised by the unexpected command, that the wine should be forthcoming at an entertainment on the following day. In the midst of their consternation, they applied to a noted wine-brewer, who inquired, 'Have you any of the wine left for a specimen?' There were a couple of bottles. He received one, took it home, examined it, and the next day, shortly before the commencement of the entertainment, a sufficient supply of the imitation was sent, and the cheat was never discovered.†

Milk, coffee, honey, cream, mustard, and a thousand other articles of domestic consumption, are frequently and extensively adulterated. The miserably poor, colicky-looking milk, so called by an insane mistake, with which this metropolis feeds her children, has a reputation as extensive as the world. In no instance, however, is this hateful practice so sinful, or so lamentably common, as in the adulteration of medicines. We may laugh at such tales as those we hear, of a gentleman taking six ounces of castor-oil in succession in vain; but the case puts on a far different aspect when it is remembered, that to the half-efficacy of a sophisticated drug may be committed the lives of our nearest and dearest friends. The native exporters adulterate, the importers adulterate, the retailers adulterate; and, with thrice-diluted energies, the medicine is placed in the practitioner's hand, 'a bruised reed, upon which, if he leans, it will surely break and pierce him.'

We believe this paper will do good. If it will show in any fresh light the short-sighted folly which seems the characteristic passion of the present age—the rage for cheapening everything—it will do both the state and the people some service. In this Journal, again and again has this subject been referred to; the present article may give some force to the previous remarks, by exhibiting, and in no over-wrought colours, one of the inevitable consequences of this cruel, hard-hearted, bargain-seeking spirit, as carrying its own measure of

retribution in its train. Two-thirds of the instances of adulteration are referrible to this cause. Setting down the rest to the unprincipled cupidity of the evil human heart, let us take our leave of a subject which it has given us more pain than pleasure to write upon.

PUNISHMENTS OF AUTHORS.

Among the Greeks and Romans, the burning of obnoxious books by legal sentence was not unfrequent. At Athens, all the copies that could be collected of the prohibited works of Pythagoras were burnt by the common crier. At Rome, the writings of Numa, which had been found in his grave, were condemned to the fire by the senate, because they were contrary to the religion which he had introduced. During the reign of Augustus, 20,000 volumes were burnt at one time: among these were the books of Labienus. Cassius Severus, a friend of Labienus, hearing the sentence pronounced, cried aloud that they must burn him too, for he had got all the books by heart. Labienus could not survive his books; so, shutting himself up in the tomb of his ancestors, he pined away, and was buried alive. Shortly after this, the writings of the very person who had been the cause of the order for burning Labienus's books, shared the same fate, being also publicly burnt. Antiochus Epiphanes caused the works of the Jews to be burnt. Eusebius informs us that Dioclesian caused the sacred Scriptures to be burnt. The writings of Arius were condemned to the flames at the Council of Nice; and Constantine threatened to put to death any person who should conceal them. At the request of the clergy assembled at the Council of Ephesus, the Emperor Theodosius II. ordered the works of Nestorius to be burnt. Leo I. ordered 200,000 books to be burnt at Constantinople.

On the first publication of 'Pasquillorum Tomi Duo,' the copies were most industriously sought after and destroyed; and no wonder, for never were the popes and monks attacked with more poignant satire, wit, and ridicule, than in these celebrated pasquinades. Owing to this destruction of the copies, it is extremely rare. Heinsius cheerfully paid one hundred Venetian ducats for a copy, which he considered to be the only one in existence. In the present day, copies of it sell for from three to eleven guineas. Fox, the historian of the martyrs, relates that in May 1531 Bishop Stokesley 'caused all the New Testament of Tindal's translation, and many other books which he had bought, to be openly burnt in St Paul's Churchyard,' where heaps of books were thus destroyed on several occasions of grand ceremonial. In June 1599, by order of Archbishop Whitgift and Bishop Bancroft, nearly all the copies of Christopher Marlow's translation of Ovid's *Elegies*, with Sir John Davies's *Epigrams* (1596), were condemned to be burnt at Stationers' Hall. The few existing copies of the little volume containing these two performances are worth from six to eight guineas each. An old writer tells us that, by command of the pope, and with the consent of the whole clergy of England, the Bishop of Rochester preached in St Paul's Churchyard against Martin Luther and all his works, and denounced those persons as accursed who kept any of his books, of which many were burnt during the sermon. In 1617, James I. published his famous 'Declaration to his Subjects Concerning Lawful Sports,' sanctioning the public enjoying certain recreations and pastimes on the Sabbath, and positively ordering all parochial incumbents to make his permission known in their respective churches, on pain of the king's displeasure. On March 10, 1643, twenty-six years after its publication, this royal book of sports was burnt by the common hangman in Cheapside, in pursuance of a resolution of both Houses of Parliament,

* We suppress the quantities.

† Beckman. *History of Inventions*. Bohn's Ed.

which commanded all persons having any copies of that work in their hands to deliver them forthwith to be burnt according to the order. For writing his 'Altrare Christianum' (1637), and 'Sunday No Sabbath,' Dr Pocklington was deprived of all his livings, dignities, and preferments, disabled from ever holding any place or dignity in church or commonwealth, and prohibited from ever coming within the verge of the king's court, and his works were ordered to be burnt by the common hangman. 'I am afraid,' says Southey, 'that this act of abominable tyranny must mainly be attributed to Archbishop Williams, who revenged himself thus for the manner in which Dr Pocklington had foiled him in a controversy.' On August 27, 1659, all Milton's books were burnt by the common hangman, according to an order altogether worthy of the prince who had Cromwell's mouldering bones taken up and exposed on a scaffold. Dr J. Drake's very curious 'Historia Anglo-Scotica, or Impartial History of the Kings and Kingdoms of England and Scotland from William the Conqueror to the Reign of Queen Elizabeth' (1703), was ordered to be burnt by the common hangman. The Scottish parliament having pronounced William Attwood's work, entitled 'The Superiority and Dominion of the Crown of England over the Crown of Scotland' (1704), to be scurrilous and full of falsehoods, commanded it to be burnt by the hangman of Edinburgh. When Linnaeus first published his works, the pope ordered them to be burnt; but some time afterwards, his holiness unseated a professor of botany for being ignorant of the writings of that illustrious Swede. In France, in 1790, above 4,194,412 books were burnt, which were in the suppressed monasteries. Two millions were on theology, and 26,000 were manuscripts. In the city of Paris alone, 808,120 volumes were burnt.

A gentleman named Collingbourne was executed on Tower Hill for the following couplet, alluding to Catesby, Ratcliff, and Lovel giving their advice to Richard III, whose crest was a white boar:—

'The cat, the rat, and Lovel our dog,
Rule all England under a hog.'

The unfortunate versifier having been hung, was cut down immediately, and his entrails were then extracted and thrown into the fire; and all this was so speedily performed, that Stow says, when the executioner pulled out his heart, 'he spake, and said "Jesus, Jesus!"' W. Thomas, author of 'A Historie of Italy, a Boke Excedyng Profitable to be Redde' (1549), enjoyed the confidence of Henry VIII. and Edward VI., but was hanged by order of Queen Mary, for the bitterness he evinced towards the pope and others in that curious and now very scarce book. The printer of a work entitled 'Doleman's Conference about the next Succession to the Crown of England,' imprinted at N. with license (1594), was hung, drawn, and quartered; and it was enacted by the 35th of Elizabeth, that whoever should have this book in his house, should be condemned as guilty of high treason. Cardinal Allen, Sir Francis Englefield, and Father Robert Parsons the Jesuit, are supposed to have written this work, the object of which was to support the title of the Infanta against that of King James, after the death of Elizabeth. It is now so very rare, that as much as fifteen pounds has been paid for one of the few copies that exist; and even an imperfect copy has been sold for L.1. 10s. Archbishop Laud was beheaded for compiling Charles I.'s 'Book of Sports' (1633). Jacques Boulay, canon of St Pierre en Pont, wrote 'Le Vigneron Français' (1723), containing an excellent account of the French vineyards, and so faithful an exposure of the frauds and adulterations practised by the growers and sellers, that tradition says he was found one fine morning hung up in the midst of his own vineyard, as a public warning to those who make people too wise by telling the tricks of trade. Campbell the poet called Bonaparte the literary executioner, because Palm the bookseller was executed in Germany by order of the French.

George Withers the poet was imprisoned for several months in the Marshalsea, as a punishment for the offence he gave by his satires, in a little book entitled 'Abuses Stript and Whipt' (1633). In James II.'s reign, Richard Baxter, the eminent divine and nonconformist, was committed to the King's Bench, by a warrant from the detestable Judge Jeffries, who treated this worthy man, at his trial, in the most brutal manner, and reproached him with having written a cart-load of books, 'every one as full of sedition and treason as an egg is full of meat.' Bussy Rabutin, maliciously betrayed by the Marchioness of Beaume, as the author of 'Amours des Illustres de France,' published at Cologne in 1717, was sent to the Bastille, and then exiled seventeen years on his own estate.

Thomas Wilson, who was seized at Rome, and thrown into the Inquisition, in consequence of the heresies contained in his 'Arte de Rhetorique, for the Use of all such as are Studious of Eloquence' (1553), would have been burnt, if the prison itself had not taken fire; for the people then broke open the doors, that the prisoners might save their lives if they could, and Wilson made his escape. Henry Stephens the printer was condemned to be burnt for publishing a work entitled 'Introduction au Traité de la Conformité des Merveilles Anciennes avec les Modernes' (1566), which is so full of amusing anecdotes and satire against monks, priests, and popes, that many authors have been tempted to extract from it without acknowledgment. While Charles II. had the portrait of Hobbes on the wall of his bedroom, in reverence of his aristocratical principles, the bishops were strongly urging the necessity of burning him, in abhorrence of his religious doctrines.

For writing 'An Appeal to Parliament, or Sion's Plea against the Prelacy' (1628), Dr Alexander Leighton was twice publicly whipped and pilloried in Cheapside, his ears cut off, his nose twice slit, his cheeks branded with a red-hot iron, and he was also eleven years imprisoned in a filthy dungeon in the Fleet. William Prynne lost his ears for writing 'Histrio-Mastix; the Player's Scourge, or Actor's Tragedie' (1633), a scarce and famous work, in two volumes. The recent recommendation of his works in the Oxford Tracts have brought them again into considerable demand.

Queen Elizabeth being enraged at a book that was written against her, and which she did not believe was penned by the person whose name appeared on the title-page, declared that she would have him racked to discover its real author. 'Nay, madam,' said Bacon, 'he is a doctor; never rack his person—rack his style. Let this pretended author have pen, ink, and paper, and help of books, and be enjoined to continue his story; and I will undertake, by collating the styles, to judge whether he were the author or not.' Voltaire, when at Berlin, wrote an epigram on his patron and host, the king of Prussia, for which he was rewarded with a flogging on his bare back, administered by the sergeant-at-arms, and was compelled to sign the following curious receipt for the same:—'Received from the right hand of Conrad Bachoffner, thirty lashes on my bare back, being in full for an epigram on Frederick the Third, king of Prussia. Vive le Roi.'

The present king of Prussia, conversing with George Kerwegh, a celebrated poet of very liberal opinions, said, 'I have to be faithful to my mission as a king, and I desire that you may be faithful to yours as a poet, for I do not like want of character. A warm opposition, founded upon conviction, pleases me; and I therefore like your poetry, although it sometimes contains a bitter doze for me.'

Milton, in his 'Treatise of Unlicensed Printing,' shows that in Greece and Rome no books were prohibited which did not blaspheme the gods or were not libellous. And passing on through the times of the emperors, after Christianity had been publicly established, he finds a similar indulgence of all books not blasphemous or calumnious; for even heretical works

were not prohibited till they had been condemned by a general council. But about the year 800, he finds this course altered, and the origin of the invention of licensing books. At one period in France, it seems that works on any subject, no matter what, were obliged to be written in a religious strain, to insure the quiet publication of them. Addison, writing from Paris in 1699, remarks, that 'as for the state of learning here, there is no book that comes out that has not something in it of an air of devotion. Dacier has been forced to prove his Plato a very good Christian before he ventures upon his translation; and has so far complied with the taste of the age, that his whole book is overrun with texts of Scripture, and the notion of pre-existence supposed to be stolen from two verses of the prophets.' Dr Johnson justly observes, that 'if nothing may be published but what civil authority shall have previously approved, Power must always be the standard of Truth.' It is rather remarkable, however, that the doctor nevertheless advocates the punishment by law of authors who murmur at the government, or are sceptical in theology.

A modern writer very truly remarks that, 'Notwithstanding the vast increase of knowledge in the departments of physical science, and the partial demolition and decay of some ethical errors (the causes of great practical unhappiness), the cause of intellectual independence is not yet gained. The right of free thought is not so firmly established, that we have nothing more to learn or to suffer in its behalf. There is, it is true, no room to doubt that the Reformation in religion, by relieving mankind from the incubus of one sole infallible authority, has materially improved the condition of society morally, scientifically, and politically, no less than in its relation to the point originally at issue. We are in no immediate likelihood of such a crusade against science, as that directed by the church in Galileo's time against the Copernican system; but though knowledge, or rather the improved moral feeling that knowledge brings with it, has gained this triumph, yet is the human mind itself a combination of the same passions, obeying the same laws, and ready at any moment to manifest, we fear, the same passions, whenever the opportunity arises for the assertion of self-interest. We ask ourselves whether, all things considered, there is not as much evil disposition manifested in the intolerance with which rival sects persecute and plague each other, in this much-lauded nineteenth century, as was displayed by the persecutors of the Galileos in the sixteenth? The fagot and the cord, it is true, are no longer permissible instruments of religious or political controversy, as in the times of Huss and Servetus; but the ingenuity of power, whether lodged in church, state, or public opinion, has employed other methods of enforcing silence scarcely less painful to the mind of the sufferer.' In fact, the law no longer pillories an author who writes to the distaste, or, like poor Defoe, above the comprehension, of the powers that be, because it no longer pillories any one; but the imprisonment and the fines remain in force.

THE HUMANISING INFLUENCE OF CLEANLINESS.

A neat, clean, fresh-aired, sweet, cheerful, well-arranged, and well-situated house, exercises a moral as well as a physical influence over its inmates, and makes the members of a family peaceable and considerate of the feelings and happiness of each other; the connection is obvious between the state of mind thus produced and habits of respect for others and for those higher duties and obligations which no laws can enforce. On the contrary, a filthy, squalid, noxious dwelling, rendered still more wretched by its noisome site, and in which none of the decencies of life can be observed, contributes to make its unfortunate inhabitants selfish, sensual, and regardless of the feelings of each other; the constant indulgence of such passions renders them reckless and brutal, and the transition is natural to propensities and habits incompatible with a respect for the property of others or for the laws.—*Topic*, No. 32.

HEART TESTS.

It is in the relaxation of security, it is in the expansion of prosperity, it is in the hour of dilatation of the heart, and of its softening into festivity and pleasure, that the real character of men is discerned. If there is any good in them, it appears then or never. Even wolves and tigers, when gorged with their prey, are safe and gentle. It is at such times that noble minds give all the reins to their good-nature. They indulge their genius even to intemperance, in kindness to the afflicted, in generosity to the conquered; forbearing insults, forgiving injuries, overpaying benefits. Full of dignity themselves, they respect dignity in all, but they feel it sacred in the unhappy. But it is then, and basking in the sunshine of unmerited fortune, that low, sordid, ungenerous, and reptile souls swell with their hoarded poisons; it is then that they display their odious splendour, and shine out in the full lustre of their native villany and baseness.—*Burke*.

NECESSITY OF TRUTH.

We are so constituted, that obedience to the law of veracity is absolutely necessary to our happiness. Were we to lose either our feeling of obligation to tell the truth, or our disposition to receive as truth whatever is told to us, there would at once be an end to all science and all knowledge, beyond that which every man had obtained by his own personal observation and experience. No man could profit by the discoveries of his contemporaries, much less by the discoveries of those men who have gone before him. Language would be useless, and we should be but little removed from the brutes. Every one must be aware, upon the slightest reflection, that a community of entire liars could not exist in a state of society. The effects of such a course of conduct upon the whole, show us what is the will of the Creator in the individual case.—*Dr Weyland*.

A FRIEND IN NEED.

An instance of animal sagacity and humanity, unequalled in our remembrance, took place before our door on Saturday. An unfortunate dog, in order to make sport for some fools, had a pan tied to his tail, and was sent off on his travels towards Galt. He reached the village utterly exhausted, and lay down before the steps of Mr Young's tavern, eyeing most anxiously the horrid annoyance hang behind him, but unable to move a step further, or rid himself of the torment. Another dog, a Scotch colly, came up at the time, and seeing the distress of his crony, laid himself down gently beside him, and gaining his confidence by a few caresses, proceeded to gnaw the string by which the noisy appendage was attached to his friend's tail, and by about a quarter of an hour's exertion, severed the cord, and started to his legs with the pan hanging from the string in his mouth, and after a few joyful capers around his friend, departed on his travels, in the highest glee at his success.—*Galt Reporter*.

NATURAL GAS JETS.

A correspondent informs us that at the village of Wigmore in Herefordshire, there are fields which may be, and two houses which really are, lit up with a natural gas. This vapour, with which the subjacent strata seem to be charged, is obtained in the following manner:—A hole is made in the cellar of the house, or other locality, with an iron rod; a hollow tube is then placed therein, fitted with a burner similar to those used for ordinary gas lights, and immediately on applying a flame to the jet, a soft and brilliant light is obtained, which may be kept burning at pleasure. The gas is very pure, quite free from any offensive smell, and does not stain the ceilings, as is generally the case with the manufactured article. Besides lighting rooms, &c. it has been used for cooking; and indeed seems capable of the same applications as prepared carburetted hydrogen. There are several fields in which the phenomenon exists, and children are seen boring holes, and setting the gas on fire for amusement. It is now about twelve months since the discovery was made; and a great many of the curious have visited, and still continue to visit, the spot.

OUR INDIA CONNECTION IN PAST TIMES.

I HAVE now attained that age when there is some dignity in remembering—when it is in vain to conceal from myself or others that my recollections carry me back to a time when they had not entered on this bustling, scrambling scene, and that what is matter of tradition to them was reality to me. But so changed is all around and about me, that I sometimes say, and often think—Are my recollections real?—did all this happen?—are persons, and places, and manners so different from what they were half a century ago? Many sad and bitter remembrances dispel the doubt, and tell me that, though customs are altered, gigantic improvements made, and many dear ones lost to me by death, and others as much so by circumstances, I am still the same; and that this is still the same world of trial, perplexity, and anxiety, though war is removed to remote and distant parts of the globe, though steam has almost annihilated time and space, and though free trade is established.

Great as are the changes which every one of my age experiences here, I don't know that to one who, like myself, has passed many years in India, any changes are so great as those which have taken place with regard to our connections with that country. Perhaps it may not be uninteresting to the reader to trace some of these improvements. So many are now connected with India in one way or another—by marriage, by relationship, or by friendship—that they may like to hear some of the differences between India in the beginning of this century, and India now; not that they must expect any very learned disquisition on the subject: I only pretend to give a simple account of every-day matters, as experienced by every-day gentlemen, and especially ladies, bound for the East.

Now, indeed, connection with India is so rapid and so certain, that the Indian mail arrives with as much regularity as if it were from some port of Britain. But it was not so in my young days: six months, instead of six weeks, was an average passage. The Indian fleet was looked for with anxiety by the few whom it concerned for several weeks before it was due. In the small country town, it was the distinguishing characteristic of one of the many Mrs Smiths, that she had a son in India—now, almost every Mrs Smith has one, if not two, thus conveniently provided for—and when an Indian letter reached the post-office in those days, it could be for no one but the Mrs Smith. How peculiar was the colour and manufacture of the paper on which the said letter was written! for when the Honourable Company monopolised all trade, none but the magnates could afford any other than China paper. How brown was the ink! made after a precious receipt communicated by the doctor of the regiment. How travel-soiled

and wayworn the precious missive looked! With what dignity it was delivered, and the heavy postage demanded, and thankfully paid! With what trembling eagerness was the large, closely-filled, well-crossed sheet glanced over! It could not be read till the anxious mother had ascertained that all was well; and then, when from her inmost heart she had blessed God for this mercy, the family were assembled to study it at leisure. It required some ingenuity to decipher the strange names of the localities: the first syllables were variously read; but it seemed likely they were not far wrong if the latter were rendered by *pore* or *gunge*. Before the day had closed, first one neighbour, and then another, had dropped in to inquire the news from India; that is to say, the news of their young townsman. Was he a general yet? Had some Hindoo rajah made him a present of countless treasures? Had an Indian princess, or 'Begum,' as they knew they were called, bestowed her hand and kingdom on him? For that a letter which had travelled so far, should only tell that perhaps the writer had got a step in his regiment—that he had been conveying treasure from one station to another—had been in at the death of a tiger—or, it might be, what was more important still, that a spinster had arrived by the last fleet—that as there were now three ladies, they had serious thoughts of getting up a fancy ball, each individual female to sustain three different characters in the course of the evening, &c. &c.—was inconceivable even to the good folks of those days, and was nearly as uninteresting as the politics, or prospects, or geography of that vast empire. Whether the war was carrying on against the Great Mogul, or the nabob of Oude, or that monster of cruelty, Tippoo Saib, they knew not, till the recollection of the interesting print of the sons of the latter being delivered to Lord Cornwallis made it quite clear, even to the lady who thought the Mysore was in Calcutta, that Tippoo Saib was dead, so that there was no use in making war against him, or those pretty gentle boys in their long white robes who were being taken as prisoners to be lodged in the dungeons of the English. What a cruel blow to the romance of the hardships they were to undergo, could she have seen the large and elegant house, the spacious grounds, numerous retinue, high-bred horses, English carriages, and luxurious pleasures that awaited them there; or, some years later, could she have met one of these identical pretty youths, transformed into a fat burly man, driving along the New Road, London! But we have wandered far from the long-expected welcome letters. When every word was known by heart, when a sound was assigned for every place, then came the question, When will the next ships be due? The next fleet may make a better voyage: we may hear again in three months. But if hope whispers thus, a louder voice will be heard, which

tells of French frigates that may intercept—of distant stations where there is no post—of other contingencies—and so they must hope on for six weary months longer.

But if 'hope deferred maketh the heart sick,' so 'familiarity breeds contempt;' and now, in this year 1847, an Indian letter is neither so honoured nor so important; maybe it is hardly welcome. There is no longer the dignity of a fleet; no longer the precariousness of wind and weather; of war or peace. All the excitement of uncertainty is removed. The mail is due: it is telegraphed. All important public events are known by this mode; and since the Cabul tragedy, public events have become important; before that, they were as little attended to as the affairs of the moon. Then the Marseilles Express still further blunts the edges of expectation; and lastly, almost to a day, the Southampton budget is distributed.

No doubt it contains many a welcome packet, many balms to lull the pangs of absence, much to make up for the misery of separation. But now that hot-pressed sentimental letter-paper, the most approved steel pens, and the finest ink, are almost as cheap on the banks of the Ganges as in London, whilst the mail starts regularly once a fortnight, the contents, as well as the appearance of the letters are changed; for it serves to while away the interminable forenoon of a long hot day, to bestow some of its dulness on friends at home; and so even distant connections, if they have nothing to tell of themselves, often indite a closely-written sheet with *public* news. For now that an interest is excited, it seems impossible that it should ever flag; and if Akbar Khan, and Dost Mahomed, and the Ameers, are exhausted, is there not Lahore, and Goolab Sing, and the Ranees and her favourites? Amongst other precious treasures in the epistolary way, a few pairs of marriage-cards, tied together with silver cord, and without any further explanation, may be put into your hands, and set your wits to work to discover which of the dancing beauties who flitted before you at the balls of the last season has, on her return to the land of her birth, bestowed her charms on the glittering Captain Firefly, or which on the stately Mr Bigwig.

The importations of children are now so numerous, that the returns must be in proportion. Many years ago, marriage was never thought of till the Company's servants had reached the higher grades of the service, and till they contemplated following their delicate offspring home. Now, the judge's assistant, perhaps not come to years of discretion, or the lieutenant at a half batta station, thinks himself entitled to set up house-keeping; and before he is quite prepared, is surrounded by a numerous band of olive-branches, seldom the harbingers of peace in any sense of the word. By and by these must be sent to Britain for education. Girls are much more manageable than boys: accomplishments are attainable for them; and when they are *finished*, they look forward to returning to India, for which they have been specially prepared, and where they hope a life of joyousness awaits them. Some may have been so fortunate as to have a foretaste of gaiety, by a winter at Bath, Brighton, or one of the capitals; but others are shipped off direct from school; and in no more time than the bare voyage out would have required in the beginning of the century, their marriage-cards may be put into your hands, to announce that they are *settled*.

In bygone days, if the exportations of young ladies returning to their homes were less, those setting out in search of one were greater; and, sooth to say, it was far to go for such a purpose. True, India was as near then as now; but when we call to mind the obstructions to getting there, the actual distance was, as it were, doubled. The first step of all was to procure an invitation; for however urgent the wishes of the young ladies, all attempts to proceed to the East were vain without this. The East India Directors were not very scrupulous in ascertaining the cordiality with which the invitation was given, but they were peremptory in requiring two respectable householders to become secu-

rity, that whatever fortune awaited the errant damsel in India, the government there should not be burdened by her. Then, instead of opportunities at least once a-month *via* the Cape, in a swift vessel, or by steam once a-fortnight, arrangements must be made to suit the fleets, which left England at intervals of about four or five months; and when it was imprudent to calculate on a shorter voyage than half a year, the outfit deemed necessary can scarcely be imagined. In addition to the countless dozens of under-clothing, a very large stock of full dress was considered essential; for as all articles of European produce, before the opening of the trade, bore extravagantly high prices in India, it was thought most unwise not to provide against all contingencies; and a young lady's wardrobe was generally so large, that much of it was frequently destroyed by white ants and cockroaches before it had been put on. Then what an array of trunks was required for these treasures, which were to be transported to Portsmouth in the heavy wagon—a work of many days! And here I must be permitted to regret those picturesque monster vehicles, with their eight stately horses, and good-tempered, ruddy-faced driver, in his clean white gabardine. How many visions did I conjure up, in my happy childhood, of the possibility of travelling from one end of England to the other, with all near and dear to me, in one of these moving habitations, stopping now and then for a few days to explore some spot of surpassing beauty! But these visions have long since vanished, and much, I fear, the subject of them has disappeared too, for years have passed since I saw a heavy wagon.

But to return. Instead of taking a seat in a first-class carriage, and whistling to Portsmouth between dinner and tea, as would be the case now, in those days the journey must be made in a post-chaise; for stage-coach travelling was eschewed by ladies. Seventy miles was too much on a stretch, and so a night was passed on the road; and this leisurely mode of beginning continued to the end. All the ships might not have arrived; the convoy of his majesty's frigates might not be ready; the last despatches from the India House not made up; and somehow it seemed as if many ships required more fair wind than one; for certain it is, the fleet often lay between three and four weeks at Spithead, waiting for what would not come. During this time many of the passengers lived on board, to avoid the expense of living at an inn. This added to the discomfort and length of the voyage; but necessity compelled them to submit. In fact, the time required to reach India by steam now is not greater than that often required formerly between embarkation at Portsmouth and making Madeira, at which island the fleets invariably stopped to take in wine for the Indian market, then an immense article of trade, though change has taken place even in this matter, and sherry is the white wine now preferred, so that there is no longer any motive for stopping here. It was, however, a delightful break, after the horrors of the English Channel and Bay of Biscay, to explore the luxuriant vineyards, visit the convents, and take leave of Europe on sunnier shores than our own island can boast. But to those who did not land, the delay added to the weary length of the voyage, and glad were they when they were once more under weigh. Then, when many of the passengers had been at least six weeks on board, the voyage might be said fairly to begin. The tedium of the daily routine soon became felt; the heat made the confinement more irksome; and any variety was welcome, even that occasioned by the ceremonies attendant on passing the line—a saturnalia now falling into disrepute, and a custom more honoured in the breach than in the observance: however, six months of monotony make strange things endurable, and so this was tolerated.

The most effectual mode of killing time was usually found in the enacting of a play. Charades were not. Some days were pleasantly consumed in selecting such a drama as suited the performers and audience; several

more in making copies of the parts for each performer from the printed one: learning these parts by heart was a work of time; so was the preparation of suitable dresses, which required some contrivance; then more than one rehearsal was necessary; so that, before the grand performance came off, a considerable advance was made in the reckoning. We do not hear of such histrionic efforts now-a-days; in fact, it is hardly worth while: a three months' passage is not so intolerable. Music and dancing afford sufficient amusement. Under the old régime, the spinsters were never allowed to be a moment on the quarter-deck; in some vessels they did not even take their meals in the cuddy; and as to joining in a dance, the thing was too monstrous to be thought of. So they must have led a weary life, and been almost ready to rejoice in the excitement that a strange sail in those times of war produced. It seldom happened that a voyage was made without one or two such alarms. Then the decks were cleared for action, the bulk-heads knocked down, the guns all put in order, the passengers provided with small-arms, and the ladies desired to be ready to go below. As long as the men-of-war accompanied the fleet, there was not much danger either from French or American bravery, and it generally all ended in smoke, or rather in no smoke at all; but served as a most fruitful and delightful subject of conversation for the rest of the voyage. And then, if the strange sail proved a homeward-bound fleet, how rapidly were all the previously-written journals closed, and transferred to the cause of alarm, with heartfelt wishes from not a few that they could have accompanied their despatches! But though this fright might terminate thus pleasantly, it was not always so. When danger was no longer dreamed of—when the very day for anchoring in the Madras Roads, or taking the pilot on board, began to be discussed—when the bill of fare offered no delicacies, and scarcely necessities—when the tea was curtailed to one cup, and the landing trunks, with all their finery, were in requisition—when nothing was thought of by the pilgrims but the speedy termination of their captivity—the enemy was often at hand, and they became prisoners indeed. In many instances French men-of-war were on the look-out, even in the Bay of Bengal, and against them the heavily-laden Indianmen had little chance. Some brilliant and successful efforts at resistance and escape were made, but it was generally considered hopeless; and then the ships were taken, and the passengers and crew, denuded of all save necessities, were landed at Pondicherry. When an ineffectual struggle had taken place, prize and prisoners were taken to the Isle of France; the gentlemen were detained on parole, and the ladies allowed to find their way to their destination as best they could.

If this misfortune, and all others, were evaded, at long last the low shores of Madras lay before them, and here terminated the trials of those bound to the Carnatic, whilst a week's detention added to the weariness of those for Bengal. The only compensation for the delay was the quantity of fresh fruit daily brought on board by the strangely-attired natives—grapes, pine-apples, cocoa-nuts, plantains of all sizes, in such abundance, that it was wonderful any one was left alive to find himself at anchor in Saugor Roads. Beyond this point the Indianmen did not proceed; here the passengers were at length liberated, and after all their discontent, many were prepared to bid adieu to the good ship with regret. This feeling generally subsided before they were actually over the ship's side. They were still one hundred miles from their destination, and had no means of reaching it till their friends or agents, in compliance with their request, had sent down a suitable boat. Three days must elapse before this boat could be at Saugor—three most uncomfortable days. All the regularity and order which makes a sea-voyage tolerable was at an end. The captain was gone with his despatches, the rigging dismantling, the decks covered with cargo, trunks, and crowds of natives, belonging to craft of all build and tonnage, to convey the lading

to Calcutta. All this, and very much more, dispelled regret; and the little boat was gladly welcomed which was to terminate the voyage of the young expectants. How little were the miseries that awaited them in that boat foreseen! It was divided into two small compartments: a very short man could stand upright in it. For a few hours it would have been endurable; but to be exposed for three or four days—or if the wind were contrary, or the current strong, a week—to the heat, the mosquitoes, red ants, or animalcules still more disgusting, was what no one had anticipated. Well was it if discomfort was all they had to endure; for in the rainy season boats were sometimes wrecked by the impetuous torrent. Thus the last week or ten days was perhaps the most trying period of the long voyage; and when the City of Palaces was at length reached, mind and body were so exhausted, that everything was seen with a jaundiced eye, and instead of appreciating the comfort of being once more on shore, a fit of illness, of which home-sickness was a distinguishing feature, frequently prostrated the new arrival.

If, in these go-ahead days, the difficulties in starting are diminished—the time at sea less by one-half—the closing scene is the grand improvement. On reaching Saugor, the telegraph summons a steamer, which takes the good ship in tow, and in a few hours she is anchored in the stream of the Hoogly, opposite Fort-William. The view from the deck during the last few hours pre-disposes the new arrival for enjoyment, since few approaches can be more beautiful than that presented by the Botanical Gardens and Bishop's College on one bank, and on the other the lovely villas, which extend upwards of seven miles from Government House, and are known as Garden Reach. Almost before the anchor is down, boats are in readiness to land the passengers at Chaudpaul Ghat, on the esplanade, the favourite evening drive along the banks of the river. I may mention that *ghat* means landing-place, and that the one in question is a broad handsome flight of steps, opposite the road leading to Government House. All the fatigue and vexation of former days have been escaped, and the unwearied traveller is landed at once, and mounts the ghat, expecting to realise all the bright visions which have so long floated in her mind.

I have said that, in former times, comparatively few children were sent home; and of those, many never revisited the land of their birth, but awaited their parents' return with such a fortune as could establish either sons or daughters in life. Few old Indians came home with limited means, as they do now: they remained to die. Marriages were so much less frequent, that the great bond of children sent home did not exist—a bond that has done more to improve the moral condition of the Europeans in India than can be imagined, though the separation still entails much evil: first, the misery of parting; then the difficulty of properly educating, and, above all, of providing for their dear ones. The girls, with their Indian connections, it may be alleged, are sooner and more easily settled than in Britain; but with the boys' whole career, the case is widely different. Circumstances must be very peculiar to afford a troop of three or four urchins a home education: they must be sent to a boarding-school, that is quite clear, and perhaps they could not be better than at a good one; but the holidays must often be passed at school too—a great evil, blunting their affections, and depriving them of home pleasures and of the friends made there. Parents in India, and children at home, are still exposed to many of these disadvantages, though in a mitigated form; but the most serious one is now immeasurably less felt. Formerly, as long as boyhood lasted, all was so far well; but when the boys were educated, unless they procured appointments in the service, what was to become of them? Their father's long absence from his native land had prevented his forming connections to assist them in working out their own fortunes; and a parent whose cadetship had made him independent at sixteen, found it difficult

to understand how his son's education must commence when his had ended—which of course must be the case with all professional education. But suppose them *finished*, as their sisters had been, how were they to be *settled*? In Calcutta, there was the bar, and the *six* great houses of agency; but in the service of these merchant princes, few obtained even subordinate appointments, unless of the blood royal. Out of Calcutta matters were not more favourable. Indigo cultivation was the refuge for the destitute. To attempt it without a large capital generally ended in ruin; and unless the speculator's success was equal to his risk, he was scarcely within the pale of society, and was looked on by the youngest Company's servant as of lower caste than himself. Up-country *traders*, though dignified with the title of Europe merchants, were neither more nor less than shopkeepers, dealers in every article of European produce, in whose 'go-downs,' as their warehouses were termed, everything imaginable was found—wine, beer, cutlery, saddlery, stationery, confectionary, hosiery, haberdashery, millinery, &c. &c. The last was generally unsaleable. Not so the pale ale: even at from twenty to thirty rupees per dozen it found ready purchasers. So did the cheese at three rupees per pound; raspberry jam at five rupees do. Flannel was sold at seven rupees per yard, a hat at thirty rupees, and other things in proportion; and then the value of a rupee was never less than 2s. 6d., frequently more, so that the profit was considerable of the consigner and consignees. The former was the Honourable Company, or officers of their ships; the latter, generally speaking, adventurers who had absconded from shipboard, or soldiers who had purchased their discharge; but no gentleman or gentleman's son could become a Europe merchant. This was not understood in Britain; and when the monopoly of the Honourable Company ceased, golden prospects seemed open to the adventurer, and crowds of young men flocked to the East to seek their fortunes. A miserable fate awaited many; and had not the deficiency of the army, during the Mahratta and Nepal wars, rendered it necessary to raise new troops, and to organise what were called local corps, with a commandant and adjutant from the line, and the subalterns when they could be picked up, the misery of the deluded adventurers would have been infinitely greater. Many were thus absorbed for a time who afterwards received appointments; others eventually took service with friendly native powers; some went to Persia; and those who could do no better, became indigo factors' assistants.

But very few of these were children of the soil. The Company's servants were too prudent to expose their sons to such risks, or too apathetic to calculate the advantages that would result from the removal of the monopoly, and judging from the evils which attended the commencement, joined in the outcry against the change; whilst the rest were satisfied with finding pale ale selling at three instead of thirty rupees per dozen, and the market equally glutted with every other article of European produce: they understood the discomfiture of the first adventurers, but did not foresee the blessings to themselves and their sons. The six houses of business in Calcutta have vanished, and left not a wreck behind! But how many have sprung up in their places, whose offices are not so hermetically sealed to young men of good education, industry, and integrity! The few magnificent Indiamen, with their full complement of officers, dwindle into insignificance before the *fleets* of free-traders that resort from all quarters of the globe, and anchor off Calcutta, besides steamers not only to Europe and the Eastern Archipelago, but on the Ganges. Instead of one newspaper, the organ of government, Calcutta produces several English, some native, and Delhi and Agra issue their gazettes. Education, so widely extended at present, requires a large staff of well-educated Europeans; and this demand must continue to increase, particularly now that the hills, almost unknown at the beginning of

the century, afford a congenial climate. Many of the subordinate offices, both in the judicial and commercial departments, are now held by persons not in the service of the Company; and for these situations sons of their servants are peculiarly eligible. The cultivation of coffee and tea has added largely to the demand for Europeans of various ranks. At present, railways occupy the thoughts of all speculators. Many doubt, and shake their heads: they will be prudent if, like Lord Burleigh, they are contented with that ominous sign, and *say nothing*—for railways cannot appear less feasible than steam-navigation did. The first railway effort can scarcely be less successful than that of the first steamer—the *Enterprise*. She was four months steaming out round the Cape; and with any less energetic commander, she would probably never have reached her destination at all. This commencement for a time damped all efforts to establish steam communication between India and Europe; yet the old *Enterprise* did good service in the Burmese war, and her usefulness perhaps assisted in disarming the prejudices against the grand scheme of bringing India nearer home, which has been carried out spite of all opposition, although, incredible as it now seems, that opposition was decided and obstinate. Such are the changes which strike even those who, like myself, look at the outside of things; but every day, as it speeds on, the march of progress will contribute to facilitate the communication, and to draw closer the bond between England and our eastern empire, until that communication shall result, as we may fondly hope it will, in the regeneration of India.

TERRESTRIAL MAGNETISM.

For many years the tendency of philosophical research has been towards the resolution of the apparently multifarious operations of nature into effects of one general cause—results of one universal law. Attempts have been made, and in some instances successfully, to reconcile the seeming discrepancies between different natural phenomena; and in cases of failure, the impression has been, not that the phenomena are irreconcilable, but that we have missed the clue to the explanation. The relations between chemistry and electro-magnetism, between animal and vegetable physiology, are becoming apparent: astronomy is unveiling the secrets of remotest space; and geology, while explaining the structure of our planet, finds itself dependent on mighty natural agencies, working in obedience to a fixed law. The latter science has often been designated as pre-eminently the science of dreams and vague speculations; but by the diligent accumulation of facts, such a degree of certainty has been attained, as to enable us to predicate with some confidence on the phenomena which it comprehends. Opinions, it is true, are still divided as to the source of central heat—the cause of volcanic and other disturbances of the earth's crust—some writers ascribing it to an interior fluid mass of fire, others to chemical action; the latter, as before observed, is now but another term for electro-magnetic action.

In No. 93 of our current series, we published a brief outline of the history of terrestrial magnetism, confining ourselves more particularly to its operation on and above the surface of the earth. In the present paper, we propose to give a summary of the views entertained with respect to what may be called geological or subterranean magnetism.

Whatever may be the direction of magnetic currents within the earth, it is not permanent on the surface. A chart of magnetic curves requires to be reconstructed every ten years. Halley was the first to attempt their delineation; and he threw out some ingenious speculations as to the cause of the variations, attributing them to the revolution of a magnet in the interior of the earth. The subject remained in abeyance until 1811, when Hansteen of Christiania investigated the phenomenon, and defined the variations of the curves, during

a period of two hundred years, with geometrical accuracy. In 1576 the needle stood 11 degrees east of north, from which point it returned until 1657-62, when it was due north. Continuing its march, the maximum of westerly declination, 27 degrees, was reached in 1815, since which period it has been again moving slowly to the east. Hansteen supposed the existence of two magnetic poles at each of the polar points of the earth, to whose revolutions the variations of the compass and of the magnetic curves were to be ascribed; but this view has been shown to be untenable. The labours of Barlow, Sabine, and Faraday, have gone far to divest the subject of many of its difficulties. The relation of magnetism to all matter, as discovered by the latter gentleman, is pregnant with important results towards a solution of the mystery: the objection that it was physically impossible for the earth to be a magnet, is now effectually set aside. Gauss of Göttingen, to whom this branch of science is so deeply indebted, computes the magnetic power of each cubic yard of the earth as equal to that of six steel magnets, each of one pound weight. With so tremendous a power, vitalising, so to speak, every inch of the globe, we are enabled to account for the eruptions, upheavals, and other disturbances by which it is visited.

The researches of Becquerel and Crose have demonstrated that minerals, whether earthy or metallic, and crystals, can be produced by weak electric currents; and it is a remarkable fact, that electric currents are found to exist in mines. Wherever the test has been applied to the metalliferous deposits in Cornwall, Wales, on the continent, or in South America, the result is the same. Mr R. W. Fox has shown, in his communications to the Philosophical Transactions, and other scientific publications, that in the lead and copper mines of this country the direction of the positive currents is generally from east-west; subject, however, to local influences, by which they are sent in the opposite direction, or north and south, where the lodes are parallel. So certain were the indications of the galvanometer in detecting the presence of metallic substances or solutions, that the miners exclaimed, 'The little thing knows ore, but doesn't know the country;' the latter part of the observation referring to the absence of movement in the needle when the instrument was applied to non-metallic rocks or earths. Mr Fox succeeded in magnetising an iron bar, and in one case obtained an electrotypic plate by the action of these natural currents. By the same agency he has converted copper pyrites into vitreous copper; and produced artificial veins of carbonate of copper and zinc 'in a wall of clay placed between the poles of a galvanic series. It appears to be highly probable,' he adds, 'that the metalliferous veins, and perhaps even the rocks themselves, impregnated as they are with different mineral waters, and thereby rendered imperfect conductors, if not exciters of electricity, may have an important influence in the economy of nature.'

In a recent number of the Journal, we quoted Professor Ansted's views as to the conversion of granite into mica-schist and clay-slate by the passage of galvanic currents; and Mr Fox has clearly demonstrated, that by such currents laminae are produced in masses of clay and other substances. The more recent experiments of Mr Hunt have extended and confirmed the former in all essential particulars. According to Mr Evan Hopkins, who published a work about three years since 'On the Connection of Geology with Terrestrial Magnetism,' magnetic currents are continually passing from the south to the north pole, through and around the earth. He shows that the southern aurora, which observation has proved to be accompanied by a similar phenomenon in the north, differs from the latter in appearance, in consequence of the greater amount of vapour produced by the preponderance of ocean in the south. The form is alike in both cases; but the light of the southern aurora is white, while in the north it inclines to red and purple. We read that

'the saturated or hydrogenous nature of the currents coming from the south pole towards the north, will account for the observed peculiarity of the southern hemisphere in its general temperature, moisture, rains, the growth of vegetation, &c. as compared with that of the northern.' Magnetic and galvanic currents are shown to be identical, except that the action of the latter is in some degree restricted to liquids; and as all metals may exist in solution, their deposition, by means of the currents, admits of demonstration. In this case nature accomplishes on a large scale what experimentalists achieve with the galvanic battery; and, as Mr Hopkins explains, 'If we admit the existence of subterranean currents, and that these exert a slow decomposing power, like that of the voltaic battery, we have a sufficient power for our purpose. In the first place, we have a mechanical tension on the consolidated parts of the rocks, by the linear action of the currents passing through them; and should the intensity of the currents be very great, fractures would ensue more or less at right angles to the direction of the force. These fractures would admit air and water, and thus produce intense heat, by the avidity with which the metallic nature of the bases of the earths and alkalis combines with the oxygen. That nearly all the substances which constitute the crust of the globe are found in solution as well as solid, saturated throughout the rocks, and to such a degree sometimes as to issue out and form springs, is well known; therefore, judging from the violent effects on a small scale which we are able to produce by experiments, a heat would be engendered quite adequate to occasion all that takes place in earthquakes and volcanic eruptions.'

In this way may be explained the formation of veins that have long puzzled the geologist. That it is in obedience to some law, is evident from the general direction of metalliferous and crystalline deposits being the same in different parts of the world. The oblique direction apparent in some instances arises from the force of tension acting at right angles to the line of structure, which is northerly and southerly. The parallelisms are, in fact, most remarkable. Humboldt found the primitive rocks, in which metallic veins chiefly occur, in South America following the same line as those of Germany and England: the same parallelism has also been traced between the upheaved rocks of Russia and Africa. It is assumed that the intensity of electric action increases in proportion as we descend deeper into the earth; and there are many striking effects witnessed in mines, which the existence of electric currents, disturbed by local causes, will alone explain. The heat in mines, particularly those of South America, is not constant; patches which at one time are at a very high temperature, become gradually cold, without any apparent cause, and after a time resume their warmth. The growth of minerals in old workings, as a mossy excrescence, is a fact well known to miners; and in some instances, as observed in Durham, Hanover, France, and in the gold mines of America, when a vein has been worked out, and the galleries left closed, they become filled with solutions of the rocks between which they are dug, and in course of time the deposits thrown down render them again worth the working—the mineral being solid, or in a powdery form, according to the intensity of the current. As is well known, crystals are hardly to be obtained by fusion, but may readily be produced from soft and moist substances; a point admitting of experimental proof. 'In order,' writes Mr Fox, 'to exhibit the mode of filling, and the formation of different crystals in the same fracture, place a mass of clay-slate between the poles of a battery, immersed in a metallic solution; it will be seen that the currents pass *only* in the direction of the cleavage. If the slate be broken across, so as to represent veins of fractures, crystals will be observed to grow in each fracture transversely; that is, in the direction of the cleavage planes.'

The igneous theory—the doctrine of central fire—has

for some time been slowly yielding to other views. All the phenomena attributed to fire may be produced by electro-magnetic currents. It is difficult to imagine the existence of fires unsupplied with the oxygen of the atmosphere; and a singular fact has come to light with regard to the earthquakes in South America, based on observations continued during nine years; the oscillations are from east to west, while the rumbling noise by which they are accompanied travels north and south, showing the influence of some law similar to that by which magnetism is governed. 'Even the cause of the variation of the needle, mysterious as it has hitherto appeared to be, may probably be referred to the relative energies of the opposing electrical currents, which are perhaps subject to occasional modifications; and the appearance of earthquakes and volcanic action from time to time seems to countenance the probability of such changes.'

Taking the ocean as the connecting medium between pole and pole, Mr Hopkins shows it to be the universal menstruum whence all the variety of materials that constitutes land is derived. The great ocean currents are from south to north, which, with the upheaval and subsidence of continents and islands, the changes of level continually going on, may be referred to the action of magnetic currents passing from one to the other pole. Everywhere, in fact, there appears to be a tendency towards the north, or pole of decomposition, from whence the decomposed substances are carried back to the south, to take on new combinations, and resume their part in perpetuating the operations of nature. In various parts of the world, the latitude of places is found to be slowly moving northwards, at the rate of from ten to twenty minutes in a century. It is a generally received fact, that the climate of Europe is colder at the present time than in the earliest periods of history. The first settlers in Iceland described it as fertile in many parts, and covered with trees; and there is evidence that the vine was cultivated where now is nothing but an icy desert. Mr Lyell observes, with regard to the material diminution of temperature in the northern hemisphere, 'we know that there are constantly some small variations in the respective geographical positions.' And it is worthy of notice, that while in the north we find fossils, and other remains of the torrid and southern regions, we never find in the south any but those of the adjacent seas, or peculiar to the locality. In the coal-beds of Melville Island, fossil plants are found which required tropical heat and light for their growth, and could not possibly have flourished through the cold and six months' night of the arctic regions. An island or continent moving from the south would naturally carry its sponges, ferns, corals, and animals to the north, modified by the changes of temperature through which it passed; and the immense deltas of floating wood in process of formation at the embouchure of the Mississippi and other rivers, to be alternately elevated and submerged during their ages of transit, would seem to be the means of providing an endless succession of coal-beds for the inhabitants of the chilly north.

As bearing on this subject, we may notice a paper by Mr Dana, in the American Journal of Science, on the 'Grand Outline Features of the Earth,' in which the phenomenon of parallelisms above referred to is ably discussed. The trends of coasts, mountain ranges of various continents, groups of islands, including the Pacific group—five thousand miles in length, although thousands of miles apart—are shown to lie in the parallel curved lines. It would appear from these facts, that the geographical distribution of the land is not a confused chance-arrangement, but that the earth has a systematic physiognomy—the directions of the leading lines being north-west and south-east. Taking the earth as an entire mass, it has a facility for splitting most readily in two directions, indicating a rupturing force and a structure by which the lines have been determined. Necker has shown the coincidence between coast-lines and mountains and magnetic curves; and

according to Sir David Brewster, the lines of magnetic intensity, corresponding with those of equal heat, manifest a mutual dependence of the two phenomena.

This brief sketch of the opinions of scientific men on this interesting subject, places geology and magnetism in quite a new light, disclosing a field of labour that promises a brilliant harvest to the persevering investigator. The wasting away and degradation of the land, which have often been viewed with alarm, are now shown to be compensated for by a process tending to the renewal and perpetuation of the physical universe. We look forward to the labours of Professor Faraday as destined to throw further light on this interesting branch of science, in which he has already done so much. According to Sir John Herschel, we are to look to 'electro-dynamics for the *vera causa* of the Newtonian philosophy;' and we may borrow the words of that distinguished philosopher in conclusion, and say—'There are secrets of nature we would fain see revealed while we yet live in the flesh—resources hidden in her fertile bosom for the wellbeing of man upon earth, we would fain see opened up for the use of the generation to which we belong. But if we would be enlightened by the one, or benefitted by the other, we must *lay on power*, both moral and physical, without grudging, and without stint.'

A SOIRÉE IN A PORTER'S LODGE.

MONSIEUR and Madame Bichonnet were not ordinary porters. They resided in the handsomest house of a respectable street of Paris; their lodge, situated on the ground-floor, on the left-hand side of the passage, at a convenient distance from the staircase, was large and airy, and looked upon the street. Their duties, which consisted in attending to the door, and keeping the house clean, were unusually light, and very liberally remunerated—considering that, like all the members of their worthy class, they were lodged rent-free, and kept by their landlord and the joint contributions of the lodgers in wood and candlelight all the year round, without mentioning the presents they regularly received on New-Year's Day. In short, M. and Madame Bichonnet were, as the reader can see, very comfortable people in their way; and they might have been perfectly happy, had not an unlucky spirit of ambition taken possession of their hearts, and made them resolved to shine, no matter at what cost. They gave parties to which the whole neighbourhood was invited; and so conspicuous did they render themselves, that the lodge of the Bichonnets became ere long a term synonymous with the focus of porter-scandal and refinement. Of course, though they were highly popular with some individuals, they were also much ridiculed by others; but on this head M. Bichonnet wisely observed, that they only met with the common fate of genius: 'they were envied and admired.' Like many illustrious individuals, the porter and his wife did not, however, differ greatly from the common race of mortals. Madame Bichonnet was a tall, muscular, raw-boned woman, whose florid complexion beamed with health, but who was, nevertheless, in a very delicate state; for, as she frequently assured her lodgers and friends in a low, languishing tone, 'she knew she was in a deep decline, and had already given up all worldly thoughts.' M. Bichonnet was a thin, tan-skinned little man, with a bright, restless, brown eye, and a highly pragmatismal and consequential eyebrow. He seldom spoke, but the little he did say was all concerning his rank and importance in society. He had also a few profound ideas on politics, and 'our duties to our fellow-men,' of which he occasionally allowed his friends to catch a glimpse; for as those ideas were so very deep, they could scarcely be said to fathom them. Amongst M. Bichonnet's favourite notions, was the firm belief entertained by him, ever since the year 1830, that Louis-Philippe had not six months to remain on the throne. This assertion, which he made with many mysterious nods and hints, had given him,

amongst the timid and prudent people of the neighbourhood, a reputation of carbonarism. It was even strongly suspected by some wise heads that the convivial parties given in his lodge were only offered to republicans in disguise. These malicious rumours did not, however, prevent M. and Madame Bichonnet from resolving to have a party on Twelfth Night of the year 183-. According to the usual custom, they were to have a cake; and in the earlier part of the evening, M. Bichonnet went out to order it at the pastry-cook's before the arrival of the guests, leaving his wife, or, as he loved to call her, his spouse, alone in the lodge, seated in a soft-cushioned arm-chair opposite the fire, and dozing very comfortably; for, under pretence of making up for her bad nights, Madame Bichonnet was always dozing. She had not been long alone when her husband came in. Approaching the fire, he ceremoniously observed, 'The night is very cool, my dear; I must beg your leave to keep on my hat.'

M. Bichonnet would never have committed the solecism of doing such a thing without his wife's permission. Madame Bichonnet merely nodded assent, and seemed to expect something else; but as her husband remained silent, she said, after a pause, 'And the cake, my dear?'

'The cake is in the oven. I saw it myself; a large, golden-coloured cake.'

'Perhaps I shall never live to eat another,' mournfully sighed Madame Bichonnet. 'Will it be here soon?' she added, after a pause.

'In less than half an hour, my dear.' Another pause.

'Will it be quite hot?' asked madame, opening her half-shut eyes.

'Quite hot.'

The portress uttered something which sounded like a hum of satisfaction, and remained silent. In less than half an hour the cake arrived, carried by the pastry-cook's boy. It was immediately placed between two earthen dishes, which had been kept warming for this purpose; and, as Madame Bichonnet observed, 'it really looked like a cake you might wish to eat on your deathbed.' Some time elapsed, and though it was past seven, none of the guests arrived. Madame Bichonnet, who sat near the cake, became very impatient at this unreasonable delay, and in a querulous tone inquired 'if they were coming?' Her husband answered he did not know, but that he strongly suspected M. and Madame Miroiton, with their young ladies—he scorned the vulgar expression of daughters—would soon make their appearance; upon which Madame Bichonnet observed, with a significant smile, they had done well to invite M. Tournour to come. The fact is, both husband and wife had quite a passion for match-making. The portress delighted in it for the sake of the thing, and her husband, because 'he felt it was a duty he owed to his fellow-men; but there were evil-minded persons, who asserted their thoughts went no farther than the marriage-dinner. 'As though,' exclaimed Madame Bichonnet, when she was told of this, 'she could think of such things with one foot in the grave!' Whatever were their real sentiments on this subject, it is, however, certain that the Bichonnets never gave a party without having at the same time some matrimonial design in view.

On this occasion the person for whose conjugal felicity they felt so lively an interest was a young shoemaker, M. Tournour, who had recently settled in the street, and whose handsome shop was precisely opposite the window of the lodge. Antoine Tournour was not yet a rich man, but his business promised well; his character was irreproachable; and though he could not exactly be termed handsome, good-temper was written on his frank, open features. He had, moreover, that smart, tidy look so characteristic of the Parisian journeyman. Indeed Madame Bichonnet averred, that of all the shoemakers who met at Montmartre on Saint-Crispin's Day—their yearly festival—he undoubtedly cut the most gallant figure; and that the dark mus-

tache which he wore, notwithstanding his peaceful avocation, was perfectly irresistible. It is true that, notwithstanding those advantages, Antoine Tournour had not expressed to Madame Bichonnet the least wish for a wife; but as she concluded that he wanted one, she resolved to provide him with one without delay. Fortunately for her purpose, she found two ladies—in the street too—who seemed quite willing to enter into her views. Perhaps it will be objected that one lady was enough for the purpose; but the prudent portress was of another opinion; she thought that if one did not suit, the other might; and that, in all cases, they would set one another off. This had been her plan hitherto; and, to say the truth, she had vast experience in those matters.

The eldest of those ladies—both of whom were well known to Tournour, whose customers they were—was Mademoiselle Ursule, the staymaker, who lived next door to him. She was, according to her own assertion, twenty-five years of age; but her features—without speaking of common report, which said ten—assigned her at least six or seven more summers. She was thin and withered-looking; she dressed very richly and tastily; and there was certainly nothing vulgar about her. It was reported that she had money in the bank; and this, as Mademoiselle Miroiton, her rival, spitefully observed, was her only attraction. It was seemingly a powerful one, for it had enabled her to refuse several good offers of marriage. Mademoiselle Miroiton, who was a dressmaker, and the daughter of one of the neighbouring porters, had no money like Mademoiselle Ursule; but she was a good figure, had a brilliant complexion, a tolerable quantity of glossy dark hair, and a sparkling, though rather scornful, black eye; so that, as Madame Bichonnet wisely concluded, if Antoine Tournour liked beauty, Mademoiselle Miroiton would do remarkably well for him; whereas, if he preferred wealth, Mademoiselle Ursule would be quite the thing. Having first delicately sounded the two ladies, and found them very favourably disposed, she next invited them to come and spend with her 'The Evening of the Kings,' as Twelfth Night is termed, intimating to them that Antoine Tournour would be there, with only a few friends.

Just as Madame Bichonnet's patience was exhausted, and she observed very enviously that the cake was quite ruined, a knock at the door announced the arrival of her expected guests. It was Antoine Tournour, who came in with the Miroiton family; for, instead of taking Madame Bichonnet's hint, and bringing only their eldest daughter, M. and Madame Miroiton had thought fit to come accompanied by four of their children; the fifth, a lad of about fourteen, had remained at home to take care of the lodge. On seeing them enter, and on thinking of the size of her cake, Madame Bichonnet's heart failed her; but she nevertheless received her guests with every demonstration of joy. Shortly after their arrival, Mademoiselle Ursule made her appearance, very richly attired as usual; and, as Mademoiselle Miroiton observed in a whisper to her sister, as usual giving herself airs. These airs consisted in holding a delicate cambric pocket-handkerchief in her hand, and, when she meant to be highly disdainful, in applying a scent-bottle to her nose, which, as she often observed, was of the truly aristocratic form. Besides the staymaker, there were several other guests whom Madame Bichonnet now bitterly regretted having invited, as she had only meant them to 'fill up' the vacant spaces of her tableau, now quite thronged with Madame Miroiton's young family. These individuals were two ladies'-maids, who resided in the house, and a mysterious melancholy-looking young man, who lived nobody knew how, and always sang comic songs wherever he was invited. When they were all seated, and there was some talk of cutting up the cake, Madame Bichonnet perceived a circumstance she had hitherto overlooked: they were in all thirteen individuals present. Now, amongst Madame Bichonnet's weaknesses, was the vulgar belief that when thirteen persons met, one of them

must certainly die within the year. On noticing this ominous fact, she therefore gave a very dismal groan, and intimated to her friends *they* need not have any fear, as she was certainly the doomed one. Everybody immediately sympathised with her, with the exception of Madame Miroiton, who, being a strong-minded woman, loudly asserted that this was a weakness she must overcome, and that she would not encourage her in it by sending home one of her children. Antoine Tourneur gallantly offered to absent himself, but Madame Bichonnet would not hear of it; and she at length decided that her husband should go and invite Rosine, a young bonnet-maker who lived in one of the attics, to come and share their mirth. M. Bichonnet departed on his errand, and after some time, made his appearance with Rosine; whom he had, however, found some difficulty in inducing to accompany him.

Her entrance into the lodge was witnessed with anything but pleasure by Mademoiselle Ursule and the daughter of the Miroitons. The former, especially, was highly indignant: the idea of associating with a bonnet-maker seemed to her perfectly preposterous; and notwithstanding the beseeching and timid glance which the young girl cast towards her, Mademoiselle Ursule immediately set her down for an artful designing creature, and applied her scent-bottle to her nose with great contempt. Mademoiselle Miroiton was at first equally annoyed; but on noticing the paleness of the new-comer, who was, moreover, in deep mourning, she immediately made room for her near herself, concluding that the contrast would greatly enhance the brilliancy of her own complexion, and the freshness of her attire.

The first impression which Rosine's appearance was calculated to produce, was not indeed to her advantage. But though she might at first be thought plain, few persons who examined her closely thought so long. Her features were not remarkably regular, but she had a profusion of fair silken tresses, which beamed like gold beneath her black crape-cap, eyes of a deep azure blue, dark eyebrows and eyelashes, and a sweet smile and pleasant voice, which rendered her at times quite fascinating, notwithstanding the languid and sickly expression her features had contracted during a life of privation and poverty. Having lost her mother a few months back, she was now an orphan; and as she was not a native of Paris, she had remained wholly friendless and alone in the great city. Fortunately for her, she found some employment in the house of a great milliner, who lived in the street; and although she had to toil almost constantly, in order to earn enough for her support, she was never heard to repine or to complain. 'In short,' as Madame Bichonnet observed to her guests shortly before she entered, 'she was a very nice girl indeed, whom she loved to patronise.'

Immediately after Rosine's entrance, Antoine Tourneur proposed to uncork two bottles of champagne, which he had brought with him; Madame Bichonnet instantly volunteered to find the champagne glasses from the cupboard of the first-floor lodgers, who had confided her the key of their apartment whilst they were away; and Mademoiselle Ursule immediately sent out one of the young Miroitons for two dozen of those biscuits, without which, the orthodox drinkers assert, champagne cannot be drunk. In the meanwhile a good deal of talking went on in different parts of the company: M. Bichonnet, who was more than usually dignified, conversed in a mysterious tone with M. Miroiton, a simple-minded man, discussing the respective merits of Thiers and Guizot, and assuring him, in a low subdued voice, that before six months he might expect to see Louis-Philippe dethroned. On hearing this piece of intelligence, the pacific M. Miroiton looked uneasily round, and with a cough of dismay, inquired of his friend how he had learned this. M. Bichonnet gave a mysterious nod, and merely said 'he knew it.'

'But, my good Monsieur Bichonnet,' urged the alarmed Miroiton, 'I hope you have no ill-will against the king?'

'Sir,' solemnly replied Bichonnet, 'I entertain no evil sentiment against Louis-Philippe; fate has never thrown us together, and we have, I may say, nothing in common either in feelings or opinions; but it is my duty to my fellow-men to inform them, when the opportunity occurs, that before six months have passed over their heads, he will have ceased to sit on the throne of France.' And leaving M. Miroiton in a state of unutterable dismay, he turned from him with a mysterious glance, as though thinking that enough had been said on the subject. Whilst this political discussion was going on, Mesdames Bichonnet and Miroiton were engaged in informing one another of the faults and merits of their respective lodgers. Madame Miroiton greatly inveighed against the avariciousness of hers; Madame Bichonnet made no similar complaints, but only lamented the want of politeness which existed in their conduct towards her. Thus, if a letter came, they insisted to have it brought up instantly; or they actually desired that Madame Bichonnet should not read their newspaper in the morning before it was sent up to them. In short, they went to such lengths, that M. and Madame Bichonnet had been compelled to draw up a little code of regulations, which was placed at the foot of the staircase for their benefit. By the first regulation, all the lodgers were requested to wipe their feet well before they went up stairs; by the second, they were recommended to keep no dogs, and not to receive visitors who were likely to be accompanied by those animals; by the third, they were informed that, on account of their portress's delicate health, they were expected never to stay out later than twelve o'clock at night. After that hour, M. and Madame Bichonnet hinted that they should lie under the painful necessity of not opening the door to them. To this regulation there was, however, affixed a *N.B.*, by which the lodgers were told that they could be admitted even after one or two, on paying a fine of fifty centimes [5d.]. On hearing this admirable code, Madame Miroiton sighed, and only wished they could have it too; but their lodgers were so restive, they would never agree to it, and Miroiton could never be induced to propose it to them.

'We never propose those things to our lodgers,' superciliously observed Madame Bichonnet. 'We do them, and they submit as a matter of course.'

Whilst the two portresses were thus engaged, the younger portion of the company had gathered round Antoine Tourneur, whose good-humour rendered him a general favourite. The young man who sang the comic songs, and the two ladies'-maids, whom Madame Bichonnet had invited because they were neither young nor pretty, as much as through any other motive, listened to his sallies in silence; but the Miroiton part of the family were in perfect ecstasies. Mademoiselle Ursule was too genteel to seem much amused; but as her vigilant eye noticed that though his discourse was directed towards her and Mademoiselle Miroiton, yet his glances more frequently wandered in the direction of Rosine, she began to look very superciliously on the young milliner once more, setting her down as an 'artful designing creature.' As somebody said something about the champagne, which had in the meanwhile been forgotten, Madame Bichonnet proposed to cut up the cake first. This was accordingly done, and Rosine, as the youngest lady present, was requested to hand it round to the company. She complied, and though somewhat embarrassed, acquitted herself of her office with much grace and modesty. Antoine was the last person to whom she handed his share of the cake, and perhaps for this reason, or perhaps because, as Mademoiselle Miroiton now began to think, he was engaged in gazing on the young milliner, he neglected to examine his portion of the cake, in order to see whether it contained the bean always inserted in it, and which renders him to whose lot it falls king for the evening.
